Renewables are expanding fast, as the Netherlands strives to meet its 14% EU target in 2020. Recent offers for unsubsidized offshore wind and a growing solar PV market are strong contributors.

Canadian wind installations fell sharply in 2017 to 340MW from 702MW in 2016 as eastern provinces cooled. Auctions such as the 700MW tenders in Alberta provide some optimism, pointing to increased demand from western Canada.

Taiwan has been taking action to increase renewables to 20% by 2025 while going nuclear-free. International and local investors have been particularly attracted to the offshore wind sector due to its strong potential and a stable financing climate.

Proposals were unveiled in January for the Renewable Electricity Support Scheme (RESS) with tech-neutral auctions due from mid-2019 replacing the former REFiT scheme. A new north-south interconnector has been approved, supporting plans for an extra 4.5GW by 2030.

Greater interconnection to the rest of Europe and the UK is likely to create future opportunities for export of excess wind-generated power.

Large subsidy-free solar projects are now springing up, such as a 170MW PPA between BayWa r.e. and Statkraft, and a 660MW PPA between Audax Energía and Cox Energy.

More than 80 solar company bankruptcies have been reported in the past year due to sharp cuts in feed-in tariff (FiT) rates and extreme competition.

Large subsidy-free solar projects are now springing up, such as a 170MW PPA between BayWa r.e. and Statkraft, and a 660MW PPA between Audax Energía and Cox Energy.
