The governance structure of shadow banking: rethinking assumptions about limited liability*

Steven L. Schwarcz
Stanley A. Star Professor of Law & Business, Duke University School of Law, Founding Director, Duke Global Capital Markets Center, and Senior Fellow, The Centre for International Governance Innovation

Abstract
In an earlier article, I argued that shadow banking – the provision of financial services and products outside of the traditional banking system, and thus without the need for bank intermediation between capital markets and the users of funds – is so radically transforming finance that regulatory scholars need to rethink their basic assumptions. This article attempts to rethink the corporate governance assumption that owners of firms should always have their liability limited to the capital they have invested. In the relatively small and decentralized firms that dominate shadow banking, equity investors tend to be active managers. Limited liability gives these investor-managers strong incentives to take risks that could generate outsize personal profits, even if that greatly increases systemic risk. For shadow banking firms subject to this conflict, limited liability should be redesigned to better align investor and societal interests.

* The original version of this article was first published at 90 Notre Dame Law Review 1 (2014). For helpful comments, I thank Brad Bernthal, Bill Brown, Anupam Chander, Peter Conti-Brown, Andromachi Georgosouli, Erik Gerding and Robert Hillman; participants in faculty workshops at University of California Davis School of Law, University of California Hastings College of Law, and University of Colorado School of Law; and participants at a public lecture at Queen Mary, University of London. I also thank Seth Bloomfield and Andres Rodriguez for valuable research assistance.
In a prior article, I argued that shadow banking is so radically transforming finance that regulatory scholars need to rethink their basic assumptions. In this article, I argue that the governance structure of shadow banking should be redesigned to make certain investors financially responsible, by reason of their ownership interests, for their firm’s liabilities beyond the capital they have invested. This argument challenges the longstanding assumption of the optimality of limited liability.

Shadow banking is a loose term that refers to the decentralized provision of financing outside of traditional banking channels, and thus without the need for traditional modes of bank intermediation between capital markets and the users of funds. The shadow banking system is immense, recently estimated at U.S.$67 trillion worldwide. Numerous types of firms make up the shadow banking system. They include special purpose entities (SPEs) used in securitization and structured finance transactions to raise financing indirectly through the capital markets, as well as finance companies, hedge funds, money-market mutual funds, nonbank government-sponsored enterprises, securities lenders and investment banks.

---

2 Ibid. See, e.g., Black’s Law Dictionary 426 (9th ed. 2009) (defining limited liability as the “liability of a company’s owners for nothing more than the capital they have invested in the business”).
5 See Schwarcz, supra note 3, at 621. These SPEs include asset-backed commercial paper (ABCP), conduits, and structured investment vehicles (commonly known as “SIVs”). Ibid.
6 Banks themselves can be regarded as shadow banking firms to the extent they facilitate customer financing in an agency capacity, as opposed to making loans or otherwise extending credit to their customers. For example, banks often create SPEs, ABCP conduits and SIVs. Banks also are important players in repo markets. Ibid. at 621-22.
Limited liability, this article contends, is not always optimal for firms that make up the shadow banking system (hereinafter “shadow banking firms”). Limited liability can sometimes make the governance structure of these firms uniquely subject to a market failure that externalizes the systemic costs of taking a risky action. To repair this failure, managers of shadow banking firms should sometimes be required to put more “skin in the game,” in order to better align incentives between their firms and society.

This article proceeds as follows. In part I, the article sets forth the background for its analysis, including a short history of how corporate limited liability became the norm and an overview of the general academic debate on whether it should be the norm. In part II, the article analyzes whether limited liability should be the norm for the governance structure of shadow banking. The article starts that analysis by proposing a normative framework for rethinking the corporate governance assumptions about limited liability. It then applies that framework to shadow banking. Although limited liability has always been a potential source of externalities, the article finds that it is a uniquely fertile source of systemic externalities for shadow banking firms, and that current law does not – nor are adaptations to traditional legal remedies likely to – adequately internalize those externalities. To mitigate those externalities, limited liability should be redesigned for shadow banking firms that are governed by conflicted investor-managers. Part III of the article explores how limited liability could be redesigned, establishing goals for the redesign and testing redesign proposals against those goals. Annex 1 to the article provides practical guidance for assessing the costs and benefits of any particular redesign.

This article does not directly engage whether – or the extent to which – shadow banking should be subject to substantive capital and solvency regulation, or even prohibited. As to the first, it has not historically been customary, at least in the U.S., to engage in solvency

---

7 Cf. White, E. N., 2011, “Rethinking the regulation of banking: choices or incentives?” 2 (unpublished manuscript) (on file with author) (arguing that bank regulatory “reform should focus on changing the incentives that parties face to insure that they are correctly aligned to induce the development of less fragile institutions”).

8 See Schwarcz, supra note 3. This article does not argue that such managers necessarily have conflicts with their firms. I have separately argued, however, that certain managers, especially secondary or middle managers, may well have such conflicts. See Schwarcz, S. L., 2009, “Conflicts and financial collapse: the problem of secondary-management agency costs,” 26 Yale Journal on Regulation, 457, 458-59.
regulation of firms that are not traditional banks. The Dodd–Frank Act is beginning to change that, with its regulation of certain systemically important financial institutions. Nonetheless, even though the limited-liability rule of corporation law can cause externalities, the government does not generally “take a more active role in assuring the solvency of corporations.” In part, this is because government micromanagement of the private sector is not always efficient. Likewise, it might well be unwise to attempt to prohibit shadow banking. Even if that were feasible, shadow banking “has the potential to create both benefit and harm. Empirically, we do not yet know which effect is likely to dominate.” Therefore, “financial regulation of shadow banking should … strive to examine … how to mitigate the potential harm while preserving the potential benefit.” is this article’s goal.

I. Background

As background for this article’s analysis of limited liability in the context of shadow banking, the discussion begins by examining, from a historical standpoint, how corporate limited liability became the general norm and then, from a scholarly standpoint, whether it should be the general norm.

A. History of limited liability

Limited liability has been called “a distinguishing feature of corporate law – perhaps the distinguishing feature” of corporate law. Yet early corporations did not have limited liability. Because their histories are different, first consider the evolution of limited liability for shareholders of nonbank corporations, then consider that evolution for shareholders of banks. Finally, compare these with the evolution of limited liability outside the U.S.

10 See infra note 124 and accompanying text.
11 Posner, supra note 9, at 413.
12 Posner, supra note 9, at 413-14 (describing the “continuous regulatory scrutiny” of an agency as a “statist” solution with only “arguabl[y]” positive benefits).
14 Ibid.
The governance structure of shadow banking: rethinking assumptions about limited liability

1. Nonbank corporations

During the early 19th century, for example, unlimited shareholder liability was the norm.\textsuperscript{16} The rationale for such unlimited liability was that creditors assured of repayment from shareholders would lend the corporation additional capital.\textsuperscript{17} Indirect shareholder liability, which resulted from the corporate power to make assessments, was also a common feature of early 19th century corporations.\textsuperscript{18}

Legislators initially were willing to allow corporations performing public functions, such as operating turnpikes, toll bridges and canals, to organize under corporate charters with limited shareholder liability.\textsuperscript{19} But they were unwilling to permit limited liability for shareholders of manufacturing corporations.\textsuperscript{20} The movement toward general limited liability started in the courts, when judges had to determine “whether shareholders were directly liable for corporate debts if the [corporate] charter was silent on shareholder liability.”\textsuperscript{21}

---

\textsuperscript{17} Mendelson, supra note 16, at 1210.

\textsuperscript{19} Not only were legislators initially reluctant to grant corporate charters with limited liability to manufacturing corporations, they were generally reluctant to grant any corporate charters to manufacturing corporations until 1809. Blumberg, supra note 16, at 590–91; Dodd, supra note 18, at 1352–55.

\textsuperscript{20} Blumberg, supra note 16, at 591.

\textsuperscript{21} This classification is partially consistent with Tufano (2003), Lerner and Tufano (2011), Merton (1995) and Allen and Gale (1994).
By the mid-19th century, most courts “presum[ed] limited shareholder liability in the absence of any legislative rule.” Different courts had different rationales. Some courts, for example, reasoned that because some corporate charters contained express statements imposing direct liability, the absence of those statements in a charter implied intent not to impose such liability. Other courts wanted to avoid an injustice to shareholders who were both innocent and ignorant of a corporation's mismanagement. Federal courts often relied on a trust-fund theory: shareholders are merely residuary owners, reimbursed only after the corporation pays its debts; thus a corporation is like a trust fund in which the capital stock is used for the payment of corporate debts while stockholders are liable only for the amount of capital stock they contribute.

Around the same time, legislatures began allowing limited liability, even for shareholders of manufacturing corporations. This change appears to have been more driven by pragmatic factors.

---

22 Mendelson, supra note 16, at 1210 n.17 (quoting Morton J. Horowitz, M. J., 1992, The transformation of American law, 1870-1960 94. Massachusetts courts as early as 1808 and Pennsylvania courts by 1816, for example, held that shareholders, absent an express provision in the charter or in a statute, were not directly liable for corporate debts. Blumberg supra note 16, at 592. Federal courts, by 1824, similarly recognized limited liability for corporate shareholders as the default rule. Ibid.

23 Ibid.

24 Spear v. Grant, 16 Mass. (1 Tyng) 9, 14 (1819) (“[I]f [a stockholder] were equally liable to each holder of the notes (which he must be if liable at all; for if the facts agreed create a promise to one, they create a promise to all), then the most palpable injustice would take place. For a stockholder, wholly innocent and ignorant of the mismanagement, which has brought the bank into discredit, might be ruined by reason of owning a single share in the stock of the corporation.”).

26 Ibid. at 436-37.

27 Blumberg, supra note 16, at 592. New York and New Jersey began allowing limited liability for shareholders of manufacturing corporations, followed in 1823 by New Hampshire, Connecticut, and Maine. Ibid. at 593, 599-600. Massachusetts, in 1830, and Rhode Island, in 1847, were slower to adopt limited liability for manufacturing corporations. Ibid. at 593.
It was in part responsive to the increasing political influence of industrialists, resulting from the rapid growth of the manufacturing industry, and in part due to a “flight-of-capital argument,” which suggests that states failing to legislate limited shareholder liability would suffer a flight of corporate capital to other states that had limited liability.

Limited liability did not become universal in the U.S., however, until a century later. California, for example, imposed pro rata shareholder liability for all corporate debts and obligations until 1931. That pro rata liability did not appear to cause a flight of corporate capital to other states or otherwise impede California's economic growth.

2. Banks

Unlike nonbank corporations, in which shareholders initially were subject to unlimited liability, bank shareholders initially were subject to (only) double liability – liability for corporate obligations in an amount equal to the par value of their shares. States imposed double liability either by express provisions in state bank charters or in their state constitutions. Congress followed the example of the states and provided for double liability in the National Banking Act of 1863.
According to the senator that proposed the provision, its purpose was to provide additional protection to bank creditors and, in effect, to also prevent the bank from engaging in excessively risky operations.\textsuperscript{35}

Double liability for bank shareholders quickly fell out of favor, however, following the Great Depression. Several factors contributed to its rapid fall from grace,\textsuperscript{36} including a perception of unfairness caused by liability of bank shareholders who did not contribute to management decisions\textsuperscript{37} and public questioning of its ability to reduce risk, given the widespread bank failures.\textsuperscript{38} In response, Congress ended double liability for shareholders of national banks and states ended double liability for shareholders of state-chartered banks.\textsuperscript{39} Today, “double liability for bank shareholders is a dead letter everywhere.”\textsuperscript{40} Limited liability is now the general default rule in the U.S. for shareholders of banks and nonbank corporations.\textsuperscript{41} As explained below, the U.S. is not alone in adopting limited liability.

\begin{footnotesize}
\begin{itemize}
\item \textsuperscript{35} Macey & Miller, supra note 32, at 36 (citing Congressional Globe, 38th Congress, 1st Session 1869 (1864)).
\item \textsuperscript{36} Ibid. at 37.
\item \textsuperscript{37} Ibid. One commentator remarked that double liability “disappeared in the wake of the Great Depression where shareholders, who were hit by the huge unanticipated losses, pleaded with federal and state legislators to move to single liability.” White, supra note 7, at 8. The public’s disgust with double liability during this time is exemplified by the popular press’s harsh criticism of the Supreme Court in 1944 for upholding as assessment of shareholders of a holding company for the liabilities of a failed subsidiary bank. Macey & Miller, supra note 32, at 37-38.
\item \textsuperscript{38} See Macey & Miller, supra note 32, at 38.
\item \textsuperscript{39} Ibid. at 38-39 (“In 1933, Congress repealed double liability for newly-issued national bank shares; and in 1935, it prospectively extinguished all double liability for national bank stock provided that a bank gave six months’ notice of termination.” (footnote omitted)); see Blumberg, supra note 16, at 601 (noting actions by Congress and state legislatures that ended double liability for shareholders of national and state banks).
\item \textsuperscript{40} Macey & Miller, supra note 32, at 39.
\item \textsuperscript{41} According to Section 6.22 of the Model Business Corporation Act, a shareholder is “not personally liable for the acts or debts of the corporation except that he may become personally liable by reason of his own acts or conduct.” Model Business Corporation Act § 6.22(b) (2002); see Mendelson, supra note 16, at 1211 n.25 (detailing the adoption of limited liability provisions in several states). Most states have adopted alternative corporate forms such as the Limited Liability Corporation (LLC) and the Limited Liability Partnership (LLP), which also provide equity owners with limited liability for corporate debts and obligations. See Mendelson, supra note 16, at 1209 n.14. For further discussion of the development of the LLC corporate form both in the United States and in foreign jurisdictions, see, e.g., Gevurtz, F. A., 2008, Business planning 64 (4th ed.); Gevurtz, F. A., 2011, “The Globalization of corporate law: the end of history or a never-ending story?” 86 Washington Law Review 475, 487; Lutter, M., 1998, “Limited liability companies and private companies,” in 13 International encyclopedia of comparative law, ch. 2, at 4-6 (Detlev Vagts ed.).

The governance structure of shadow banking: rethinking assumptions about limited liability

3. Limited liability’s development in foreign jurisdictions

Civil law countries in Europe adopted limited liability even earlier than the U.S.\textsuperscript{42}. Canada\textsuperscript{43} and England\textsuperscript{44} adopted limited liability after the U.S.

The move toward limited liability in England is instructive. Joint stock associations, in which members were liable for association debts, were the dominant form of business organization during the early 19th century, because corporate charters were difficult and expensive to obtain.\textsuperscript{45} Members attempted in various ways to limit their liability, including by inserting the term “limited” in the association’s name.\textsuperscript{46} At least partly in response, the Parliament passed a law facilitating general incorporation but imposing unlimited liability on shareholders, with rights of contribution from fellow shareholders.\textsuperscript{47} That law also prohibited the corporate charter from limiting liability.\textsuperscript{48}

Wealthy investors were outraged, being concerned “that creditors would first proceed against them in preference to less wealthy members.”\textsuperscript{49} They sparked a political debate, arguing that the law would inhibit investment.\textsuperscript{50} As a result, Parliament first enacted limited liability for investors in railways, then one of England’s most successful and growing industries.\textsuperscript{51} That soon led to a legislative broadening of limited liability, not only for shareholders of new corporations generally, but also for members of new and existing joint-stock associations.\textsuperscript{52} Shortly thereafter, limited liability was extended to shareholders of banks\textsuperscript{53} and insurance companies.\textsuperscript{54}

4. How history informs the limited liability debate

The historical trend toward limited liability can help to inform the debate. In the U.S. and England, the legislative trend was heavily influenced by lobbying. In the U.S., the legislative trend was also influenced (in a nonbank context) by fear of capital flight to other states.\textsuperscript{55}

The judicial progression toward limited liability has more of a “fairness” rationale: to protect innocent shareholders who are not in a “capacity to control” or influence management decisions.\textsuperscript{56} This rationale is also part of the justification for shifting from bank-shareholder double liability to limited liability: imposing double liability on bank shareholders who did not contribute to management decisions created a perception of unfairness.\textsuperscript{57}

The shift from bank-shareholder double liability to limited liability also reflected disappointment that double liability did not prevent the bank failures of the Great Depression. The magnitude of the Great Depression, however, does not make it an appropriate test; its impact overwhelmed even many prudent banks.\textsuperscript{58}

\textsuperscript{55} Subsequent experience suggests, however, that unlimited liability may not necessarily cause capital flight. See supra notes 30-31 and accompanying text (observing that California’s pro rata liability rule did not appear to cause a flight of corporate capital to other states); see also Blumberg, supra note 16, at 594 (“In fact, there is little sign that the different legal rules on shareholder liability adversely affected economic development in Massachusetts and Rhode Island during this period.”); Dodd, supra note 18, at 1378 (“There is some indication that the early adoption of the limited-liability principle by New Hampshire and Connecticut stimulated the development of the cotton-textile industry in those states. Yet both states continued to lag, as producers of cotton textiles, behind Massachusetts, which did not adopt the principle until 1830, and Rhode Island, which did not adopt it until seventeen years later.” (footnotes omitted)).

\textsuperscript{56} See supra note 24 and accompanying text.

\textsuperscript{57} See supra notes 37-38 and accompanying text. At least some bank shareholders were also bank insiders, however. Macey & Miller, supra note 32, at 56.

\textsuperscript{58} A positive result of the double liability regime was that it encouraged prudent bank practices including voluntary liquidation of failing banks. Macey & Miller, supra note 32, at 57. Notably, however, involuntary liquidations approached the number of voluntary liquidations and consolidations during the difficult years of 1929-33. Ibid. at 58.
The historical trend in England toward limited liability can likewise help to inform the debate. The turning point was opposition to unlimited liability by wealthy investors, who feared they would become the ultimate deep pockets for their firms' liabilities. It is unclear, though, whether fully limiting liability was the only way to remove the fear, thereby ensuring investment. Without totally sacrificing the monitoring benefits of shareholder liability, that fear could have been mitigated by partially limiting shareholder liability, such as to double liability or pro rata liability.

B. The general academic debate
Next consider the academic debate on whether limited liability should generally be the norm. To that end, the discussion below reviews scholarly challenges to limited liability made prior, and then in response, to the “global financial crisis” (GFC), and then compares those challenges with scholarly justifications for limited liability.

59 See supra note 49 and accompanying text.
60 Professor Gerding also argues that the historical trend in England toward limited liability followed a pattern—an expansion of limited liability and liberalization of corporate law rules, followed by a financial boom, then followed by a financial bust—that proceeded like clockwork every ten years from 1825 through the nineteenth century. Gerding, E. F., 2013, Law, bubbles, and financial regulation 74-77.
61 By “global financial crisis,” this article means the financial crisis of 2007-08.
1. Scholarly challenges prior to the global financial crisis
Scholarly challenges to limited liability initially focused on harm caused by corporate
torts. The concern was that limited liability created moral hazard: shareholders whose
liability is capped at the value of their equity contribution would want their firms to engage
in riskier – and therefore more tort-prone – projects than is socially optimal.

To mitigate this suboptimal risk-taking, some scholars advocated pro rata unlimited
shareholder liability; others advocated a control-based liability regime. Under the
former, shareholders would be liable for unpaid tort judgments in proportion to their equity
ownership of the firm. Under the latter regime, only shareholders with a “capacity to
control” their firms would be liable for tort judgments.

62 See Hansmann & Kraakman, supra note 31, at 1879–80 (briefly introducing the existing scholarship
proposing to curtail limited liability).
63 Ibid. at 1882.
64 Mendelson, supra note 16, at 1232-33. I have previously considered an analogous problem: “marginalizing”
risk in debt markets. Investors follow the conventional wisdom of risk dispersion – they diversify their
investment portfolio to reduce risk. Risk dispersion, however, can lead investors to both underestimate and
under-protect against risk due to market failures including information failure, model failure, human
processing failure and collective action failure. This “marginalization” of risk can result in harm to the actual
market participants and harm extending beyond the market participants, such as financial crisis or systemic
487.
65 Hansmann & Kraakman, supra note 31, at 1892-1909.
66 Mendelson, supra note 16, at 1271-1301.
67 Hansmann & Kraakman, supra note 31, at 1892; see Ibid. at 1906-09 (arguing that pro rata liability would
marginally increase shareholders’ incentives to monitor and help avoid their firm’s risky activities).
68 Mendelson, supra note 16, at 1271-1301.
69 A shareholder with the “capacity to control” is a shareholder with a controlling ownership stake in the
corporation. Mendelson, supra note 16, at 1271 n.281. These shareholders are uniquely positioned with
low-cost access to corporate information and are better able to influence corporate decisions. Ibid. at
1249-52. Corporations that have a shareholder with the “capacity to control” are more likely to engage in
excessively risky activities. See Ibid. at 1258 (explaining that shareholders with the “capacity to control” are
more attracted to hazardous activities with small risk of large loss and better able to influence the
corporation to engage in these activities). Consequently, “under limited liability, there is a set of risky
activities that a company with a dispersed share ownership would not select, but a company with a
controlling shareholder would.” Ibid.
70 Ibid. at 1271; see Ibid. at 1272-79 (detailing the logistics of a control-based liability regime).
Scholars also challenged the limited liability of bank shareholders, arguing for a return to double liability.70 Professors Macey and Miller used historical data on bank failures71 to argue that banks whose shareholders are subject to double liability may fail less frequently than banks whose shareholders have limited liability.72 Professor Grossman, an economist, also used historical data to conclude that double liability generally had the effect of reducing risk-taking.73 These studies countered the dubious narrative that because double liability failed to guarantee bank stability during the Great Depression, it does not reduce risk-taking.74

70 See Macey & Miller, supra note 32 and accompanying text. Recall that double liability meant shareholder liability for obligations in an amount equal to the par value of their shares.

71 Macey and Miller scrutinized the recovery rate of national bank assessments, the liquidation of national banks, the average annual losses from national bank failures, and bank capital ratios. Ibid. at 55–61.

72 Ibid. at 32. Immediately following the Great Depression, conventional wisdom was that double liability failed to adequately protect bank creditors and therefore the system needed to be replaced by deposit insurance to better protect bank creditors. See supra notes 36–41 and accompanying text. Macey and Miller, however, concluded that double liability was a successful mechanism for protecting bank creditors and promoting sound banking practices because recoveries from shareholders were good, the recovery rate during this period was approximately 51%; banks were encouraged to privately transfer assets before failure; banks were encouraged to more cautiously manage assets to avoid shareholder assessment; and banks were allowed to operate with lower capital ratios. Macey & Miller, supra note 32, at 56, 61-62.

73 Grossman, R. S., 2001, “Double liability and bank risk taking,” 33 Journal of Money, Credit & Banking 143, 157 (“The effects of double liability can be seen through lower failure rates, higher capital ratios, and higher liquidity ratios among state banks in multiple-liability states.”). Professor Grossman examined state-level failure data on state and national banks, state-level balance sheet data for state and national banks, and data on individual state and national banks in Alabama and Mississippi prior to and following the introduction of double liability in Mississippi. Ibid. at 147.

74 Ibid. at 157-58. Grossman also examined empirical data to understand the motivations for legislating double liability or limited liability. Grossman, R. S., 2007, “Fear and greed: the evolution of double liability in American banking, 1865-1930,” 44 Explorations in Economic History 59. States legislating double liability were motivated by fear; they wanted to deter high levels of bank failures by motivating sounder banking practices. Ibid. at 71-75. States legislating limited liability were motivated by greed; they wanted to encourage growth through increased bank investment and risk-taking. Ibid.
2. Scholarly challenges after the global financial crisis

In response to the GFC, scholars have revisited the limited liability debate, focusing on moral hazard as a cause of excessive risk-taking in the financial industry. Professor White, an economist, posits that the crisis resulted from the “steady erosion of incentives that induced management to control risk,” including investment banks’ shift from partnerships with unlimited liability to corporations with limited liability.75 Law professors Hill and Painter have independently made and developed similar arguments.76 Other scholars, such as Peter Conti-Brown, have echoed these arguments, focusing on the impact of the risk-taking: shareholders protected by limited liability can “pocket the benefits generated by [their firms’] risky activities,” while the costs of those risky activities is passed on to the government through bailouts and ultimately onto taxpayers.77

75 supra note 7, at 2-3. White suggests that double liability for banks reflected a “superior alignment of liabilities and incentives for shareholders and managers so that the risk-taking temptations of managers were controlled.” Ibid. at 4-6 (supporting this conclusion with numerical examples to demonstrate that the system of double liability incentivized shareholders, senior bank management, and directors to control and reduce risk-taking).

76 See infra notes 80-84 and accompanying text.

These arguments effectively continue the pre-crisis observation that limited liability theoretically incentivizes risky action. The investment banking example of the shift from unlimited to limited liability also helps to concretize this observation.

Prior to 1970, investment banks were organized as partnerships, with partners facing personal liability for the debts of their firm if it fails. This restrained risk-taking. Following a change to the New York Stock Exchange rules allowing brokerage firms to have publicly owned shares, investment banks switched to the corporate form.
Because investment bankers were now protected by limited liability, “frenetic risk-taking [allegedly] became the norm.”83 Professors Hill and Painter liken this to gambling with “house money,” in which the investment bankers have no personal stake.84

3. Scholarly justifications for limited liability
Next compare these scholarly challenges to limited liability with the scholarly justifications for limited liability. The traditional scholarly justification for limited liability is the encouragement of equity-capital investment.85 This so-called “efficiency justification”86 holds that limited liability creates appropriate incentives for widespread investor participation in equity ownership, especially in large corporations.87

83 Ibid. at 1181–82.
84 Ibid. at 1183–84. An additional consequence of limited liability is that investment bankers are less concerned with the absolute amount of money at risk. For example, “[t]he possibility of a loss of $950 million of a $1 billion portfolio, having $50 million left over, may matter less than the possibility of a loss of all but $1 million of just about any large portfolio.” Ibid. at 1185.
86 The moniker “efficiency justification” arose because limited liability is said to encourage an efficient level of investment. Mendelson, supra note 16, at 1217.
Besides addressing investor risk aversion, limited liability reduces monitoring costs: an equity investor need not overly worry about monitoring the firm’s risky actions (for which the investor could ultimately become liable), nor worry about monitoring the wealth of other shareholders (for whose shareholder liability the investor could ultimately bear under a joint-and-several shareholder liability regime; this could be especially tricky given the free transferability of equity shares). Additionally, by promoting the free transfer of shares, limited liability serves to create incentives for managers to act efficiently: shareholders can transfer their shares if managers perform poorly, and the new shareholders can appoint new managers.

---

88 See Mendelson, supra note 16, at 1218-19 (discussing arguments as to how limited liability corrects excessive investor risk aversion). Scholars have argued that limited liability allows shareholders to diversify their investments and consequently encourages shareholder risk-taking. Under limited liability, no one investment will expose all of the shareholder’s assets to risk. Therefore, a shareholder can invest in a diversified portfolio of varying risk where each investment’s ultimate risk is limited to the amount of capital invested. Blumberg, supra note 16, at 616; Easterbrook, F. H., and D. R. Fischel, 1985, “Limited liability and the corporation,” 52 University of Chicago Law Review 89, 96-97 (Easterbrook & Fischel); Ribstein, L. E., 1991, “Limited liability and theories of the corporation,” 50 Maryland Law Review 80, 102. In the absence of these diversification benefits, some projects with positive net present values would be rejected as “too risky.” Easterbrook & Fischel, supra, at 97.

89 Blumberg, supra note 16, at 614; Easterbrook & Fischel, supra note 88, at 94-95; Ribstein, supra note 88, at 103.

90 Blumberg, supra note 16, at 614-15; Easterbrook & Fischel, supra note 88, at 95. Limited liability also contributes to uniformity in share price. Without limited liability, investors would attach different values to shares, depending on that investor’s wealth. Therefore, limited liability, by removing a shareholder’s individual wealth from contemplation of liability, results in homogenous shares with a single market price. See Easterbrook & Fischel, supra note 88, at 92; Halpern et al., 1980, “An economic analysis of limited liability in corporation law,” 30 University of Toronto Law Journal 117, 147.

91 Easterbrook & Fischel, supra note 88, at 95. Limited liability promotes the free transfer of shares because, as discussed supra note 90 and accompanying text, the costs of monitoring other shareholders are reduced, simultaneously reducing the cost of transferring shares to a new shareholder.

92 Easterbrook & Fischel, supra note 88, at 95. Easterbrook and Fischel also argue that legislative-imposed limited liability is more efficient than legislative-permitted limited liability because contracting around liability would be cost prohibitive, thereby discouraging capital investment. Ibid. at 93. Accordingly, limited liability effectively “creates an efficient contract term applicable to all transactions.” Blumberg, supra note 16, at 615-16.
4. How existing scholarship informs the limited liability debate
The existing scholarship recognizes that limited liability can create moral hazard, leading to excessive corporate risk-taking. On balance, though, limited liability encourages equity-capital investment by addressing investor risk aversion and by reducing investor monitoring costs. It may also create incentives for managers to act efficiently.

The existing scholarship does not examine limited liability in the context of the emerging shadow banking system. Even the scholarship that uses investment banks as an example does not purport to analyze how investment banks – which can be viewed as a type of shadow bank93 – might or might not be generally representative of shadow banking firms.94 This article next analyzes limited liability in the shadow banking context.

II. Analysis
Should limited liability be the norm for the governance structure of shadow banking? To answer that question, this article begins by deriving a normative framework for rethinking the corporate governance assumptions about limited liability. Thereafter, the article applies that framework to shadow banking.

93 See supra text accompanying notes 5-6.
94 Hill and Painter focus on investment banking but nonetheless define the firms they discuss as “most firms that are federally insured banks or bank holding companies; firms that originate, buy, or sell mortgages; firms registered as broker-dealers or investment advisors under the Securities Exchange Act; and at least the larger hedge funds.” Hill & Painter, supra note 80, at 1190. Although this definition would, in part, cover the shadow banking system, their article lacks analysis as to whether investment banks might or might not be generally representative of shadow banking firms.
A. Deriving a normative framework

Any attempt to rethink assumptions relating to corporate governance should situate that inquiry within a normative framework. Because corporate governance rules are a subset of financial regulation, that inquiry should be situated within a financial regulatory framework. The central purpose of financial regulation is correcting market failures. Of the five general categories of market failures, three are potentially relevant to corporate governance: information failure, agency failure and externalities (externalizing harm onto third parties).

---

95 Cf. “Corporate governance and the new financial regulation: complements or substitutes?” Research Newsletter (European Corporate Governance Institute), Spring 2011 (discussing the relationship between corporate governance and financial regulation).

96 See, e.g., Gowland, D., 1990, The regulation of financial markets in the 1990s, 21 (1990) (“[R]egulation can be beneficial if and only if there would otherwise be market failure.”). Welfare economists argue that regulation should also include the goal of maximizing social welfare. See, e.g., Wolf, C., 1979, “A theory of nonmarket failure: framework for implementation analysis,” 22 Journal of Law and Economics 107, 110-11 (noting that, from the perspective of welfare economists, “it is theoretically correct to consider distributional inequity as an example of market failure”).

97 The other two traditional market-failure categories – monopolies and other types of non-competitive markets, and the public goods problem (a form of collective action problem describing the inability of markets to provide goods that, like clean air, are non-excludable and non-rivalrous, since some parties will want to free ride on public goods when such goods are (inevitably) purchased by others) – do not appear to be relevant to corporate governance, much less to limited liability of shareholders.
In the shadow banking system, the third market failure – externalities – becomes much more important. That is because the paramount concern posed by the shadow banking system is that it “can, if left unregulated, pose systemic risks to the financial system.”98 Systemic risks, in turn, can cause massive harm to the real economy.99

In discussing the third market failure, I have argued, however, that “externalities” is a misleading term because it conflates cause and effect. Externalities are not the cause but, instead, the consequences of a failure.100

---

98 Schwarcz, supra note 3, at 625. See also Bakk-Simon et al., 2012, “Shadow banking in the Euro Area, European Central Bank Occasional Paper No. 133, Apr. 2012, at 3 (observing that disintermediation is “one of the main sources of financial stability concerns”).

99 Schwarcz, S. L., Systemic Risk, 97 Georgetown Law Journal 193, 207, 235 (2008) (attempting to estimate the costs of a systemic failure of the financial system, which could go beyond direct economic costs and include indirect “social costs in the form of widespread poverty and unemployment”); cf. Anabtawi, I., and S. L. Schwarcz, 2011, “Regulating systemic risk: towards an analytical framework,” 86 Notre Dame Law Review 1349, 1376 n.109 (arguing that because financial market participants are able to externalize significant social costs associated with their risk-taking, it is in their interest to take on excessive risks and oppose regulatory efforts to curtail, or increase the costs of, their ability to do so).

100 Economists often recognize, for example, that a market failure has occurred if the production of goods or services results in externalities. See, e.g., Bator, F. M., “The anatomy of market failure,” 72 Quarterly Journal of Economics 351, 351 (1958) (defining market failure as “the failure of a more or less idealized system of price-market institutions to sustain ‘desirable’ activities or to estop ‘undesirable’ activities”). The cause of the market failure is not externalities per se, however; rather, it is the problem with the production of goods and services that resulted in the externalities. The externalities merely signal that a market failure has occurred. Cf. Sunshine, M., 2009, “How did economists blow it (Part 2)? - They missed the negative externalities of America’s limited liability society,” Sunshine Report (Sept. 8), http://www.thesunshinereport.net/marksunshine/?p=402 (arguing that although economic “theories about efficient markets and logical behavior are pretty good, the fundamental application of these theories stinks”).
When discussing the causes of market failures, I have proposed that we substitute for “externalities” the term “responsibility failure” — referring to responsibility for a firm’s ability to externalize a significant portion of the costs of taking a risky action. This article will use that more precise terminology.

This article therefore next analyzes limited liability from the standpoint of three market failures: agency failure, information failure, and responsibility failure. To further clarify the terminology, references below to “limited liability” shall mean limited liability of equity investors; references below to “equity investors” shall mean shareholders and other persons, whether or not they own shares of stock, who share in the firm’s profits; and references below to “investors” shall mean equity investors.

101 Schwarcz, supra note 1, 1799–1800. Referring to externalities as a type of market failure is also misleading because externalities cannot be considered a truly distinct type of market failure; all types of market failures can result in externalities. Zerbe, R. O. and H. E. McCurdy, 1999, “The failure of market failure,” 18 Journal of Policy Analysis & Management 558, 561; cf. Andreas A. Papandreou, A., 1994, Externality and institutions 167–69 (“[I]f externality is simply another word for market failure, or institutional failure . . . the notion of externality becomes redundant.”). To avoid this circularity, some economists have even questioned whether “externalities” should denote a separate market-failure category. See, e.g., Papandreou, supra, at 99-100 (arguing that the “non-existence of markets” is the actual market failure referred to as “externalities” and that it is “not useful to treat externalities as a subset of market failure, nor for that matter as a cause of market failure”); Zerbe and McCurdy, supra at 562 (arguing that externalities should not be defined as market failures); cf. Ibid. at 564 (arguing that “a close examination of the market failure concept gives rise to all sorts of definitional problems” related to externalities).

102 This might include, for example, a manager who has a bonus-compensation scheme based on the firm’s profits.
B. Applying the framework to shadow banking

1. Limited liability and agency failure
Agency failure refers to conflicts of interest between principals and their agents — in our case, between a firm and its investors on the one hand and the firm's managers on the other hand.\textsuperscript{103} Examples would include conflicts between investors of a firm and the firm's officers and directors. This market failure does not appear to be directly relevant to analyzing the limited liability of investors.\textsuperscript{104}

2. Limited liability and information failure
Information failure refers to asymmetric information, or even mutual misinformation, between parties. An example of the former would be the insufficiency of disclosure to completely inform investors of the merits and risks of a highly complex securities investment.\textsuperscript{105} Information failure can arise from various causes, including the potential for transaction costs relating to information acquisition to diminish the incentive to acquire such information.\textsuperscript{106}

\textsuperscript{103} Because it is not a principal-agent conflict, agency failure does not include the conflict in which investor-managers have strong incentives to take risks that could generate out-size profits, even if that greatly increases systemic risk.

\textsuperscript{104} See Schwarcz, supra note 8. This market failure may be indirectly relevant to limited liability. For example, the greater the investor liability, the greater the incentive of investors to align managers to their interests.

This market failure is directly relevant to limited liability. If investors stand only to lose their equity investments in a firm, they will have limited incentives to incur costs monitoring the firm. I next argue, however, that monitoring incentives will be even more limited for investors of shadow banking firms. Among other reasons, that is because those investors may not bear all of the adverse consequences of such limited monitoring.\textsuperscript{107} Increasing investor liability can help to increase those monitoring incentives.

That does not fully address, however, the design of the monitoring incentives. Ideally, increasing investor liability should encourage not only monitoring of the firm, qua firm; it should also encourage monitoring of the firm’s potential to trigger systemic risk, thereby externalizing risk. I next address that concern.

3. Limited liability and responsibility failure

In the shadow banking system, limited liability is an important source of responsibility failure that can lead to externalities – and, even more significantly, to systemic externalities.\textsuperscript{108} If a shadow banking firm cannot pay all of the externalized harm for which it becomes liable, the firm’s investors will not (qua investors) be financially responsible beyond the capital they have invested. To that extent, limited liability creates moral hazard.\textsuperscript{109}

\textsuperscript{107} See infra notes 121-31 and accompanying text (explaining why investors of shadow banking firms will not bear all of the adverse consequences of a systemic collapse).

\textsuperscript{109} See supra notes 63-64 and accompanying text (discussing limited liability and moral hazard).
Admittedly, limited liability creates moral hazard even outside the shadow banking system. It is widely understood, for example, that “most of a corporate structure’s externalities result from the limited-liability rule of corporation law.”\textsuperscript{110} Moral hazard in shadow banking, however, is more likely to have systemic consequences. There are two reasons why: decentralization makes managers of limited liability shadow banking firms more likely to take risks than managers of other limited liability firms, thereby making shadow banking firms more likely to fail; and disintermediation makes the consequences of a shadow banking firm’s failure more likely to be systemic than the consequences of an ordinary firm’s failure.

First consider why decentralization makes managers of limited liability shadow banking firms more likely to take risks than managers of other limited liability firms. The relatively small firms, such as hedge funds, that operate in the shadow banking system are often managed directly by their primary investors.\textsuperscript{111}

\textsuperscript{110} Schwarcz, S. L., 2004, “Collapsing corporate structures: resolving the tension between form and substance,” 60 Business Lawyer 109, 144.

Because such investor-managers typically are entitled to a significant share of their firm’s profits,\(^{112}\) they have strong incentives to take risks that could generate large profits.\(^{113}\) Some risks might even potentially generate such outsized profits that investor-managers would gain lifetime financial security.\(^{114}\) Yet if a risky action exposes their firm to significant liability for externalized harm, limited liability protects those investor-managers from losing more than their invested capital.

This is radically unlike the management incentives in non-shadow banking firms. In those firms (such as ordinary business corporations and even traditional banks), senior managers tend to share only indirectly in profits, such as through stock options. Most profits ordinarily are paid to non-manager investors. Furthermore, managers are often invested in maintaining their jobs. They are, therefore, much less motivated to take actions that risk the firm, such as exposing the firm to significant liability for externalized harm.

Managers of limited liability shadow banking firms are thus more likely to take risks than managers of other limited liability firms, thereby making shadow banking firms more likely to fail.

---

117 Cf. Hu, H. T. C., “Risk, time, and fiduciary principles in corporate investment,” 38 UCLA Law Review 277, 320 (1990) (observing with respect to a traditional firm that “[t]he manager cannot take as cavalier an attitude toward the diversifiable risks of his corporation as the stockholder can. If a corporation does badly because a new investment project fails, a manager must rely primarily on other projects undertaken by the same corporation to balance against it. His salary and prospects and his value to a potential new employer would be hurt by poor firm performance”).

118 Shadow banking firms are also more likely to fail than traditional banks because they are not subject to the type of solvency/prudential regulation imposed on traditional banks, see infra note 124, and also because shadow banking firms are not limited in their activities to financial intermediation so they can also take other types of business risks. See Crockett, A., and B. H. Cohen, “Financial markets and systemic risk in an era of innovation,” 4 International Finance 127, 137-38 (2001) (discussing that the expanded range of activity by financial institutions has increased “the exposure of institutions to [market] shocks” and also observing that the wider range of markets in which financial institutions are engaged has increased the “number of potential channels of propagation of shocks”).
That likelihood of failure is further increased by the fact that shadow banking financial intermediation, like traditional bank financial intermediation, often involves the short-term funding of long-term projects. This creates a liquidity risk that the short-term debt cannot be rolled over. A failure to roll over (i.e., refinance) short-term debt could result in the firm's default.

The consequences of a shadow banking firm's failure are also more likely to be systemic than the consequences of an ordinary firm's failure. Like traditional banks, shadow banking firms engage in financial intermediation on which the real economy is dependent. Because all financial intermediaries — including shadow banking firms and traditional banks — tend to be highly interconnected, the failure of a shadow banking firm could trigger the failures of other financial intermediaries. Such a chain of failures would be the epitome of a systemic event, especially if it materially reduces the availability of financial intermediation.

Additionally, the aforesaid short-term funding of long-term projects not only increases the likelihood of a shadow banking firm's failure but can increase the systemic consequences of that failure. Among other reasons, an event that prevents one shadow banking firm from refinancing can also prevent, or can be correlated to other events that also prevent, other shadow banking firms from refinancing.

119 SIVs, for example, issue short-term commercial paper to fund long-term projects. See Schwarcz, supra note 1, at 1805. Money-market mutual funds also provide short-term loans to fund long-term projects. Ibid. Admittedly, the traditional business of banking also uses short-term borrowing from depositors to finance long-term loans to bank customers. Ibid. at 1806. However, the potential systemic externalities are offset by prudential regulation and deposit insurance. See infra note 124.

120 See Schwarcz, supra note 1, at 1806.

121 See Anabtawi & Schwarcz, supra note 99, at 1355 (“The financial system is comprised of institutions that are highly interrelated. In this sense, it is a ‘network.’” (quoting Brunnermeier, M. K. 2009, “Deciphering the liquidity and credit crunch 2007–2008, 23 Journal of Economic Perspectives 77, 96)); see also Ibid. at 1356-61 (explaining how inter-institution correlation, or interconnectedness, helps to explain why certain failures become systemic and others, like Enron's failure, do not).

122 See Schwarcz, supra note 99, at 204.

123 See supra notes 119-120 and accompanying text.
Because shadow banking does not (at least currently) require the type of solvency/prudential regulation imposed on traditional banks,\textsuperscript{124} such a correlated failure would be highly systemically risky. Economists have identified the failure of shadow banking firms to roll over short-term debt as a contributing factor to the GFC.\textsuperscript{125}

In summary, although the limited liability of firms can always cause externalities, the limited liability of shadow banking firms is much more likely than the limited liability of non-shadow banking firms to cause systemic externalities. This is certainly a quantitative distinction: systemic externalities can cause much more harm than non-systemic externalities.\textsuperscript{126} I next argue that this is also a qualitative distinction.

An important function of law, and in particular tort law, is to operate as a mechanism for internalizing a firm’s externalities. By empowering injured third parties to sue a firm for harm, tort law helps to internalize a firm’s externalities because the firm will either pay the cost of the externalities ex-post through a judgment or will not engage in the activity ex-ante to avoid the potential costs of an adverse judgment.

\textsuperscript{124} In bank-intermediated finance, systemic externalities, specifically bank runs, are mitigated by prudential regulation and deposit insurance. See Schwarcz, supra note 1, at 1810-11. In contrast, prudential regulation does not or cannot be applied to many shadow banking firms. Ibid. at 1811-15. Meanwhile, disintermediation by spurring the short-term funding of long-term projects can mimic the effects of a bank run. Ibid. at 1807-08. Section 113 of the Dodd-Frank Wall Street Reform and Consumer Protection Act empowers the Financial Stability Oversight Council (FSOC) to designate nonbank financial institutions (SIFIs) and therefore subject them to consolidated supervision by the Federal Reserve and enhanced prudential standards. Notably, as of this writing, only three firms have been designated as a SIFI by the FSOC. “Designations,” Financial Stability Oversight Council, http://www.treasury.gov/initiatives/fsoc/designations/Pages/default.aspx (last visited Sept. 28, 2014) (listing designated SIFIs as only American International Group, Inc., General Electric Capital Corporation, Inc., and Prudential Financial, Inc.).

\textsuperscript{125} See Schwarcz, supra note 1 at 1807-08 (discussing the findings of economists Gary Gorton and Andrew Metrick, Federal Reserve Board economists, and the European Central Bank).

\textsuperscript{126} See supra note 99 and accompanying text.
Still, limited liability has practical consequences for traditional banking firms: third parties injured by even non-systemic harm are not always be able to recover damages that perfectly internalizes the harm because the firm causing the harm may have insufficient capital to pay the damages.127

The consequences of limited liability for shadow banking firms, however, are qualitatively different: third parties injured by systemic harm will have virtually no chance to recover damages that internalizes the harm. Although this difference arises partly because shadow banking firms are unlikely to have sufficient capital to pay for the massive and widespread harm caused by a systemic collapse,128 the conceptual reason for the difference is legal: as explained below, existing law does not — and adaptations to traditional law are unlikely to — effectively internalize that harm.

As mentioned, tort law operates as a mechanism for internalizing a firm's externalities. To win their lawsuits, injured third parties normally must show their harm to be a causal129 and foreseeable130 consequence of the firm's actions. Third parties injured by systemic harm caused by the firm's actions would unlikely be able to show that, however. Systemic harm can affect a wide range of third parties in unpredictable ways, such as an individual who is forced to close her family-owned restaurant during a systemically caused recession.

127 Cf. supra notes 62–64 and accompanying text (discussing scholarly arguments that limited liability generally encourages firms to engage in riskier, and therefore more tort-prone, projects than is socially optimal). Third parties injured by non-systemic harm, specifically tort victims, might not always be able to recover damages. Cf. Hansmann & Kraakman, supra note 31, at 1881 (“Already, strong empirical evidence indicates that increasing exposure to tort liability has led to the widespread reorganization of business firms to exploit limited liability to evade damage claims.”).

128 Cf. Scharcz, supra note 99, at 206 (discussing the extent and magnitude of that harm).

129 Under the “but-for” test of causation, “causation exists only when the result would not have occurred without the party's conduct.” Black's Law Dictionary, supra note 2, at 228.

Nor is it likely that changing the causation-and-foreseeability standard to enable third parties to win those lawsuits would be an efficient solution. At the very least, courts would face a line-drawing problem and would be forced to make complicated decisions as to what systemic externalities should (or should not) be considered compensable.

The analysis has shown that limited liability investors of shadow banking firms lack sufficient monitoring incentives to avoid engaging in systemically risky actions, and that adaptations to traditional legal remedies are unlikely to adequately internalize systemic externalities. I next examine whether redesigning limited liability could be a more efficient solution to this problem.

III. Redesigning limited liability

Because it increases responsibility failure in the shadow banking system, limited liability should be redesigned if the benefits of the redesign outweigh the costs. This part examines how that might be done.

A. Setting goals for redesigning limited liability

Any redesign of limited liability should at least take into account its traditional justifications. The goal of the “efficiency” justification is to create incentives for widespread investor participation in equity ownership.

131 In theory, civil damages can be imposed under existing law for all harms, regardless of foreseeability, pursuant to the allocation-of-resources justification of enterprise liability. See Calabresi, G., 1961, “Some thoughts on risk distribution and the law of torts,” 70 Yale Law Journal 499, 529. The rationale for enterprise liability is that prices should reflect the “actual costs” of goods so as to allow purchasers to make informed decisions. Ibid. at 502. Therefore, “the cost of injuries should be borne by the activities which caused them,” regardless of fault, because injuries represent a “real cost” of those activities. Ibid. at 505. Foreseeability is irrelevant under enterprise liability because unforeseeable harms are “just as truly costs” of doing business as foreseeable harms. Ibid. at 529.

132 Other possible non-traditional legal solutions, such as regulation directed at ensuring shadow banking firm solvency, are beyond the scope of this article. Cf. Posner, supra note 9, at 413-14 (stating that “it is arguable that the government should take a more active role in assuring the solvency of corporations” to mitigate externalities caused by corporate limited liability, and observing that “the regime in banking . . . and in European corporate law” uses “continuous regulatory scrutiny of the corporation by an administrative agency”).

133 See supra notes 85–87 and accompanying text.
Investors have risk aversion;\textsuperscript{134} the more risk they are exposed to, the less incentive they will have to invest. Even fully rational investors will refuse to invest if their risk is unlimited, because the expected value of their losses might well exceed the expected value of their gains.\textsuperscript{135}

Therefore, any redesign of limited liability should attempt not only to minimize investor risk aversion but also to make investors comfortable that the expected value of their potential gains should exceed (by a sufficient margin to encourage investment) the expected value of their potential losses.\textsuperscript{136} The most effective way to accomplish that would be to set some type of cap, or limit — such as double liability, which a recent study suggests is a "superior alignment of liabilities and incentives"\textsuperscript{137} — on the potential liability.

Another traditional justification for limited liability is that it reduces monitoring costs because an investor need not overly worry about monitoring the firm's risky actions, for which the investor could ultimately become liable.\textsuperscript{138} In the shadow banking system, this justification should be given less weight because the potential for shadow banking firms to trigger systemic risk may well justify, if not necessitate, increased monitoring.

A related monitoring-cost justification for limited liability is that an investor need not worry about monitoring the wealth of other investors, whose liability the investor could ultimately bear under a joint-and-several liability regime.\textsuperscript{139}

\textsuperscript{135} But cf. Conti-Brown, supra note 77, at 414, 446 (arguing that the successful operation of investment banks as partnerships until late in the 20th century suggests that limited.

\textsuperscript{136} A related justification for limited liability was that as corporations increase in size, there are more associated risks, and the risks are consequently of much larger scale, which can serve to discourage investment by all but the wealthiest of investors. Blumberg, supra note 16, at 612–13. Shadow banking firms, however, tend to be relatively smaller.

\textsuperscript{137} See supra note 75, at 4.

\textsuperscript{138} See supra note 89 and accompanying text.

\textsuperscript{139} See supra note 90 and accompanying text.
This risk — including the complications it entails due to the free transferability of equity shares — could be avoided by a redesign, such as double liability, in which any given investor’s liability would be independent of the liability of other investors.

Yet another traditional justification for limited liability is that by promoting the free transfer of shares, it serves to create incentives for managers to act efficiently: investors can transfer their shares if managers perform poorly, and the new investors can appoint new managers.\textsuperscript{140} This justification does not appear to be compelling.\textsuperscript{141} Even existing investors could choose to vote out existing managers.

The final traditional justification for limited liability turns on fairness: that imposing additional liability on investors who did not contribute to management decisions created a perception of unfairness.\textsuperscript{142}

\textsuperscript{140} See supra notes 91–92 and accompanying text.
\textsuperscript{141} This justification may make even less sense for shadow banking firms, like hedge funds, that are closely held. Some argue that limited liability is not efficient for small, closely held corporations. Halpern et al., supra note 90, at 148. Their rationale includes that limited liability then introduces more aggregate costs than in large, publicly traded corporations and also incentivizes shifting risk to parties less capable of bearing it, such as involuntary and trade creditors. See Freedman, J., 2000, “Limited liability: large company theory and small firms,” 63 Modern Law Review 317, 332-35.
\textsuperscript{142} See supra notes 56–57 and accompanying text (discussing this liability in the context of double liability of bank shareholders). It may well be appropriate to consider fairness as a normative goal. See, e.g., Kaplow, L., and S. Shavell, 2001, “Fairness versus welfare,” 114 Harvard Law Review 961, 1015 (arguing that it is appropriate to consider distributional fairness in making a policy decision).
If, however, such liability is imposed only on investor-managers, which is this article’s shadow banking focus — and perhaps only on investor-managers with the power to “control” the firm — then it should be more consistent with the fairness justification. Moreover, imposing such liability on only those investors would be efficient insofar as it ties the increase in liability to control over risk-taking decisions.

In sum, any redesign of limited liability in the shadow banking system should have at least the following goals: (i) it should increase such liability in a way that increases investor incentives to monitor (and guard against) the firm’s potential to trigger systemic risk; (ii) it should minimize investor risk aversion and encourage investment by setting a cap on liability sufficient to make investors comfortable that the expected value of their potential gains should exceed, by a sufficient margin, the expected value of their potential losses;

143 Investor-manager liability may also have indirect benefits. For example, limited liability might undermine — and thus increasing liability might support — the business judgment rule and the policies behind the rule, such as keeping courts from judging business decisions through hindsight-biased lenses, and allowing managers to take the risks necessary for maximizing investor value. See, e.g., In re Citigroup Inc. Shareholder Derivative Litigation, 964 A.2d 106, 124 (Del. Ch. 2009) (stating that doctrines such as the business judgment rule “properly focus on the decision-making process rather than on the substantive evaluation of the merits of the decision” to counteract the hindsight bias that some courts exhibit); Kaal, W. A., and R. W. Painter, 2010, “Initial reflections on an evolving standard: constraints on risk taking by directors and officers in Germany and the United States,” 40 Seton Hall Law Review 1433, 1440-41, 1449 n.56 (2010) (stating that “managers often must take reasonable risks” in the ordinary course of business and arguing that hindsight bias can have a significant influence on whether risks taken are viewed as reasonable or excessive); cf. Armour, J., and J. N. Gordon, 2014, “Systemic harms and shareholder value,” Journal of Legal Analysis (forthcoming 2014), available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2307959 (arguing that the business judgment rule protection, which makes sense for officers and directors of a non-financial firm, leads to excessive risk taking in a systemically important financial firm; and proposing officer and director liability rules to counter that risk taking).

(iii) it should discourage cross-investor monitoring by ensuring that any given investor’s liability is independent of the liability of other investors; and (iv) to ensure fairness and maintain efficiency, it should increase liability only for investor-managers (because it is that dual nature that creates the real risk). Because a number of these goals are in tension, no possible redesign of limited liability could ever perfectly achieve all of these goals. For example, the greater the investor liability, the more investment would be discouraged.145

Any redesign would also have to confront the collective action problem of cross-border capital flight. I have already discussed how increasing investor liability might trigger capital flight between states.146 Domestically, that problem could be solved by increasing investor-manager liability under federal, as opposed to state, law.147 The collective action problem could also arise internationally, however. If one or more nations increase investor liability, investors may decide to move their money to firms in other nations, creating an international collective action problem. Cross-border cooperation would be needed to help mitigate that problem.148

145 Cf. White, supra note 7, at 8 (observing a “potential trade-off” insofar as modifying limited liability might “create[] an incentive that induce[s] [bank] shareholders to act more cautiously, reining in managers’ efforts to expand loans that contributed to the growth of the economy”). Another potential concern is that increasing investor liability could make equity investments even more relatively expensive than debt, thereby increasing leverage. Although that is a theoretical concern, so many other considerations go into the determination of a firm’s capital structure that I do not believe it is likely to become a practical concern (and if it ever becomes a practical concern, that concern could be addressed through the issuance of non-voting equity).

146 See supra note 55 and accompanying text.

147 Federal law constitutionally allows piercing of the corporate veil to impose control-person liability in furtherance of federal statutory policies. Cf. Pension Benefit Guar. Corp. v. Ouiet Corp., 630 F.2d 4, 12 (1st Cir. 1980) (holding that the Employee Retirement Income Security Act’s (ERISA) imposition of plan-termination liability jointly and severally on the plan sponsor and all members of its control group is not an unconstitutional denial of due process).

Finally, in furthering the first of these goals — increasing investor incentives to monitor and guard against systemic risk — this article does not claim that systemic risk could be eliminated.\textsuperscript{149} Nonetheless, that goal is important because systemic externalities are the externalities most likely to cause widespread and serious harm.\textsuperscript{150}

B. Testing redesign proposals against the goals

This article does not purport to test all possible proposals to redesign limited liability against the foregoing goals. Consider in the context of the shadow banking system, however, the generalized proposals referenced earlier.\textsuperscript{151} Professors Hill and Painter propose using compensation as the test, imposing personal liability on investors that earn over a threshold number (such as U.S.$3 million annually).\textsuperscript{152} A purely compensation-based test has the drawback, however, that it does not target only investor-managers. Additionally, a compensation-based test might be able to be manipulated by creatively structuring compensation in ways that avoid the test.\textsuperscript{153} Professors Hansmann and Kraakman propose the use of pro rata unlimited investor liability, under which investors would be liable in proportion to their investment.\textsuperscript{154}

\footnotesize
\textsuperscript{149} For analysis of the limits of law to control systemic risk, see Schwarcz, S. L., 2012, “Controlling financial chaos: the power and limits of law," 2012 Wisconsin Law Review 815, 829–33 (discussing requiring banks and systemically important nonbank to pay for a systemic risk protection fund in order to help to internalize the most harmful externalities of the shadow banking system while stabilizing systemically important firms and markets) and Acharya et al., 2010, “A tax on systemic risk,” Feb. 3, at 2–4, http://vlab.stern.nyu.edu/public/static/SR-tax-nber.pdf (arguing that each institution should be required to pay a “tax” that is calculated according to the extent to which that institution is likely to contribute to systemic risk). Indeed, the law generally does not require that all externalities be internalized. See, e.g., Trebilcock, M. J., 1993, The limits of freedom of contract 20 (asking what types of externalities the law should require to be internalized).

\textsuperscript{150} Schwarcz, supra note 99, at 206.

\textsuperscript{151} Those proposals are generalized insofar as they are not designed specifically for the shadow banking system. They nonetheless are worth testing because they reflect the serious thoughts of respected scholars on limited liability generally. See e.g., Hill & Painter, supra note 80.

\textsuperscript{152} See Hill & Painter, supra note 80, at 1188.

\textsuperscript{153} It also is unclear how Hill and Painter’s proposal addresses risk aversion; they do not specify whether investor liability should be subject to any cap. See Hill & Painter, supra note 80.

\textsuperscript{154} See supra note 65 and accompanying text.
Their proposal has two drawbacks: it may discourage investment because it does not set a cap on liability, and it does not target only investor-managers. Professor Mendelson proposes the use of a control-based liability regime under which only investors with the “capacity to control” would be liable.155 This proposal should be superior to pro rata unlimited investor liability because it better aligns the costs of risky activities with control. In a pro rata regime a controlling investor-manager’s liability is limited by his share of corporate equity and not his actual influence on risky activities.156 However, Mendelson's proposal may discourage investment because it does not set a cap on liability.

Furthermore, a drawback to all of these referenced proposals is that they fail to effectively address systemic risk.157 Any redesign of limited liability must resolve the dilemma that investor-managers would have relatively little incentive to monitor and guard against their firm’s potential to trigger systemic risk if, as argued, tort law bars third parties injured by systemic harm from recovering damages.158

---

155 See supra note 66 and accompanying text.
156 By the same logic that investors with the “capacity to control” can use their unique position to induce the corporation to engage in excessively risky activities, these investors can also use their unique position to limit firm risk. See Mendelson, supra note 16, at 1280-85.
157 Indeed, it is the inherently systemically risky nature of shadow banking that limits this article’s recommendations to the shadow banking sector. I am not suggesting, for example, that limited liability be changed for operating companies that do not engage in financial intermediation, even if such companies are run by dominant shareholders. The consequences of such a company’s failure are not likely to be systemic, and — all things being equal — the tort system is more likely to enable injured third parties to recover from the company, thereby helping to internalize the cost of the failure.
158 See supra notes 127-130 and accompanying text. Because there is always some risk of losing a lawsuit, investor-managers should have some incentive, albeit limited, to monitor and guard against their firm’s potential to trigger systemic risk.
A possible solution to this dilemma would be to couple any increase in limited liability with a privatized systemic risk fund—which would be used to mitigate systemic harm—into which systemically risky shadow banking firms would be required to contribute. Privatizing the funding would help to reduce a shadow banking firm's incentive to create systemic externalities by engaging in financially risky activities; indeed, the likelihood that firms will have to make additional contributions to the fund to replenish bailout monies should motivate them to monitor each other and help control each other's risky behavior. Making investor-managers personally liable, subject to a cap, for shortfalls in their firm's fund contributions would likewise motivate them to monitor and help control their firm's systemically risky behavior.
IV. Conclusion

We tend not to focus on liability limitation at the firm level, simply accepting it as a fact of life. Limited liability is not always optimal, however, for firms that make up the shadow banking system. It motivates investor-managers of those firms to take risks that could generate outsize personal profits, even if that greatly increases systemic risk.

The law does not effectively mitigate these systemic externalities. Tort law, for example, traditionally helps to mitigate non-systemic externalities resulting from limited liability by empowering injured third parties to sue for harm that is a causal and foreseeable consequence of the tortfeasor's actions. Systemic harm, however, affects a wide range of third parties in unpredictable ways; it is neither directly causal, nor clearly foreseeable.

To mitigate systemic externalities, limited liability should be redesigned, as explained in this article, for investor-managers of shadow banking firms. Any such redesign must balance the need to increase liability sufficiently to reduce systemic risk with not discouraging investment. The redesign should also minimize costs by discouraging the need to engage in cross-investor monitoring. These competing goals may well be achievable by restricting the increased liability to a capped multiple of the original investment, such as double liability.

Regardless of how limited liability is redesigned, it faces the dilemma that investor-managers would have relatively little incentive to monitor and guard against their firm's potential to trigger systemic risk if, as indicated, tort law bars injured parties from recovering damages. A possible solution to this dilemma would be to couple the redesigned limited liability with a privatized systemic risk fund – which would be used to mitigate systemic harm – into which systemically risky shadow banking firms would be required to contribute. If their firm has insufficient capital to make these contributions, investor-managers would become personally liable for at least a portion of the insufficiency, thereby motivating them to monitor and help control their firm's systemically risky behavior.

An ultimate question for any redesign of limited liability is empirical: will its benefits exceed its costs? The answer to that question will depend on the actual mechanics of the redesign, and their real-world impact on risk-taking and investment. Annex 1 below sets forth practical considerations that are likely to be relevant to any such cost-benefit determination.
Annex 1 - Guidance on redesigning limited liability
This annex provides practical guidance on redesigning limited liability, including guidance for assessing costs and benefits. Such guidance is qualified by, and intended to be interpreted by reference to, the more complete analysis in the article.

1. Limited liability should be increased only for investor-managers of firms that operate in the shadow banking system. Because the parameters of shadow banking are not yet well defined, the redesign should take into account how to delimit those firms. Because the primary goal of increasing limited liability is to reduce systemic risk, shadow banking firms designated as systemically important financial institutions (SIFIs) under the Dodd–Frank Act should at least be included in the redesign of limited liability. Other shadow banking firms should be considered for inclusion, however. Being relatively small, many shadow banking firms might avoid SIFI designation; nonetheless, they could be systemically important if, for example, their solvency or liquidity is highly correlated with that of other shadow banking firms.

2. The term “investor-managers” means equity investors who also have significant power to control the firm’s actions. To minimize discouraging investment, the redesign should apply only to the subset of those equity investors who are entitled to a significant share of their firm’s profits, since they are the ones who have strong incentives to take risks with their firms.

3. Limited liability should be increased sufficiently to motivate investor-managers to monitor and guard against systemic risk. This could be done by increasing such liability to a multiple of the original investment, discussed overleaf.

164 See supra notes 3-5 and accompanying text.
165 See supra notes 97-99, 108-126 and accompanying text.
166 See supra note 124.
167 See supra notes 142-143 and accompanying text.
168 See supra notes 112-114 and accompanying text.
4. Any such increase in limited liability should be constrained so as not to unduly discourage investment. This could be done by setting a cap on liability, such as restricting liability to a small multiple of the original investment. Recent scholarship suggests that double liability might represent a good balance. What actually represents a good balance — e.g., a multiple of two (double liability), or less than two (e.g., 1-1/2 liability), or more than two — will ultimately be an empirical question.

5. Any increase in limited liability should minimize costs by discouraging the need to engage in cross-investor monitoring. Increasing such liability to a multiple of the original investment (such as double liability) would satisfy this requirement because any given investor-manager’s liability would be independent of the liability of other investors.

6. Because the law does not currently have an effective mechanism to internalize systemic externalities, an increase in limited liability would not, by itself, necessarily expose investor-managers to systemic costs for which they should be responsible. To mitigate systemic risk-taking, any increase in limited liability should be coupled with a mechanism to internalize those costs. One such mechanism could be a privatized systemic risk fund into which systemically risky shadow banking firms would be required to contribute. Investor-managers would thus be liable, up to their liability cap, for their firm’s insufficiency in making contributions. Creating and maintaining such a fund would have its own costs and political considerations.

7. To solve the collective action problem of cross-border capital flight (i.e., that increasing liability in any given jurisdiction could drive investors to firms in other jurisdictions) — or at least the fear of capital flight — federal law, rather than state law, could be used to increase limited liability in the U.S.. Some form of cross-border cooperation would be needed, however, to help mitigate the problem of international capital flight.

The EY Global Financial Services Institute brings together world-renowned thought leaders and practitioners from top-tier academic institutions, global financial services firms, public policy organizations and regulators to develop solutions to the most pertinent issues facing the financial services industry.

The Journal of Financial Perspectives aims to become the medium of choice for senior financial services executives from banking and capital markets, wealth and asset management and insurance, as well as academics and policymakers who wish to keep abreast of the latest ideas from some of the world’s foremost thought leaders in financial services. To achieve this objective, a board comprising leading academic scholars and respected financial executives has been established to solicit articles that not only make genuine contributions to the most important topics, but are also practical in their focus. The Journal will be published three times a year.

About EY
EY is a global leader in assurance, tax, transaction and advisory services. The insights and quality services we deliver help build trust and confidence in the capital markets and in economies the world over. We develop outstanding leaders who team to deliver on our promises to all of our stakeholders. In so doing, we play a critical role in building a better working world for our people, for our clients and for our communities.

EY refers to the global organization, and may refer to one or more, of the member firms of Ernst & Young Global Limited, each of which is a separate legal entity. Ernst & Young Global Limited, a UK company limited by guarantee, does not provide services to clients. For more information about our organization, please visit ey.com.
