The fact that a commodity is a major physical input in a production process does not automatically translate into a separately identifiable effect on the price of the item as a whole, but it might. For example, although crude oil price changes might influence the long-term price of plastic toys to some degree, they are unlikely to have a distinguishable effect on the retail price in the short term. Similarly, the price for pasta at food retailers in the medium to long term also responds to changes in the price for wheat, but there is no distinguishable direct effect of wheat price changes on the retail price for pasta, which remains unchanged for longer periods even though the wheat price changes. If retail prices are periodically adjusted in a way that also directionally reflects the effect of wheat price changes, that is not sufficient to constitute a separately identifiable risk component. The evaluation is always based on relevant facts and circumstances. An example of a risk component that has a distinguishable effect on changes in the cash flows an entity is exposed to is provided in the application guidance to IFRS 9.

Illustration 14-2: Hedge of a non-contractually specified risk component

An entity purchases a particular quality of coffee of a particular origin from its supplier under a contract that sets out a variable price linked to the benchmark price for coffee. The price is represented by the coffee futures price plus a fixed spread, reflecting the different quality of the coffee purchased compared to the benchmark plus a variable logistics services charge reflecting that the delivery is at a specific manufacturing site of the entity. The fixed spread is set for the current harvest period. For the deliveries that fall into the next harvest period this type of supply contract is not available.

The entity analyses the market structure for its coffee supplies, taking into account how the eventual deliveries of coffee that it receives are priced. The entity can enter into similar supply contracts for each harvest period once the crop relevant for its particular purchases is known and the spread can be set. In that sense, the knowledge about the pricing under the supply contracts also informs the entity's analysis of the market structure more widely, including forecast purchases which are not yet contractually specified. This allows the entity to conclude that its exposure to variability of cash flows resulting from changes in the benchmark coffee price is a risk component that is separately identifiable and reliably measurable for coffee purchases under the variable price supply contract for the current harvest period as well as for forecast purchases that fall into the next harvest period. [IFRS 9 Appendix B.6.3.10(b)].

Other components that can be hedged include selected contractual cash flows and a specified part of the nominal amount of an item and combinations of these items. [FRS 102.12.16C(b), FRS 102.12.16C(c)]. FRS 102 does not provide detail on what is meant by a ‘specified part of the nominal amount of an item’. The hedge accounting rules in FRS 102 are based on IFRS 9 which states that such a component of a nominal amount could be a proportion of an entire item (such as, 60% of a fixed rate loan of £10 million) or a layer component (for example, the first £6 million of sales). [IFRS 9 Appendix B.6.3.16].

IFRS 9 contains some restrictions when hedging a layer component that includes a prepayment option. In particular, a layer component that includes a prepayment option does not qualify as a hedged item in a fair value hedge if the fair value of the prepayment option is affected by changes in the hedged risk (unless the changes in fair value of the prepayment option as a result of changes in the hedged risk are included when measuring the change in fair value of the hedged item). However, this restriction is not included in FRS 102 and there is no requirement to analogise to the requirements of IFRS 9 or to assume that IFRS 9 applies where FRS 102 is silent. Hence, an entity applying FRS 102 does not encounter this issue and can designate a layer component in a fair value hedge, although the effect of the related prepayment option on the layer's fair value with respect to the hedged risk will still need to be included.

In FRS 102, risk components may also include a designation of changes in the cash flows or the fair value of a hedged item above or below a specified price or other variable (i.e., a one-sided risk). [FRS 102.12.16C(a)]. For example, an entity could hedge the cash flow losses resulting from an increase in the price of a forecast commodity purchase above a specified level. This is useful when economically hedging with options, which only provide protection above or below a specified price level.

An issue that entities have faced under IAS 39 and IFRS 9 is the prohibition on hedge accounting for changes in LIBOR when the hedged item attracts an interest rate below LIBOR, e.g., LIBOR-0.25%. Historically this was often referred to as the 'sub-LIBOR issue', however now that markets have moved away from LIBOR as the predominant benchmark interest rate following global Interest Rate Benchmark Reform, it is more commonly referred to as the 'sub-benchmark issue'. Application of hedge accounting to the benchmark rate component is not permitted under IFRS for a 'sub-benchmark' instrument because the hedged component cannot be more than the total cash flows of the hedged item.

The restriction also applies under FRS 102 due to the requirement that the designated component of a hedged item comprises less than the entire fair value change or cash flow variability of the item. [FRS 102.12.16C]. Part of the rationale for this prohibition is that if benchmark rate fell to 0.25% in this example, any changes in benchmark rate below 0.25% would not ordinarily cause any further variability in cash flows on the hedged item, as there is usually an inherent floor. However, an entity could still achieve hedge accounting by designating the cash flows of the hedged item in their entirety (e.g., benchmark rate-0.25%) with, for example, a benchmark rate swap as the hedging instrument, although some ineffectiveness may arise and need to be recorded in profit or loss.

4.2.3 Groups of items as hedged items

Hedging relationships typically include a single hedging instrument (e.g., an interest rate swap) hedging a single item (e.g., a loan). However, for operational reasons entities often economically hedge several items together on a group basis (e.g., a number of purchases in a foreign currency could be hedged with a single forward contract).

FRS 102 explains that a hedged item can either be a single item or a group of items, including components of items, provided that all of the following conditions for groups of items are met:

- The group consists of items that are individually eligible hedged items.
- The items in the group share the same risk.
- The items in the group are managed together on a group basis for risk management purposes.

And

- The group does not include items with offsetting risk positions. [FRS 102.12.16B].

Whether the items in the group are managed together on a group basis is a matter of fact, i.e., it depends on an entity's behaviour and cannot be achieved by mere documentation. Examples of groups of items that could be eligible for hedging if all of the conditions are met are a portfolio of customer loans that pay interest based on SONIA, or a portfolio of shares of Swiss companies that replicates the Swiss Market Index (SMI).

Hedge accounting for a net position (e.g., a group of assets and liabilities or income and expenses) is not permitted, as this would include offsetting risk positions. However, where an entity undertakes economic hedge accounting of a net position, the entity could still achieve hedge accounting under FRS 102 by designating a specified component of the gross hedged items. For example, consider an entity with sterling functional currency that has forecast foreign currency sales of €100 and purchases of €80, both in 6 months. It hedges the net exposure using a single forward contract to sell €20 in 6 months. Hedge accounting could be achieved by designating the forward contract as hedging €20 of the €100 forecast sales.

4.3 Hedging instruments

4.3.1 Introduction

FRS 102 defines a hedging instrument as a financial instrument measured at fair value through profit or loss that is a contract with a party external to the reporting entity and is not a written option unless:

- The written option is an offset to a purchased option in the hedged item and the combination is not a net written option.

Or

- The written option is combined with a purchased option and the combination is not a net written option. [FRS 102.12.17, FRS 102.12.17C].

Entities are therefore permitted to designate derivatives as hedging instruments, but also non-derivative financial assets or non-derivative financial liabilities that are accounted for at fair value through profit or loss are eligible hedging instruments. This can be helpful if an entity does not have access to derivatives markets or does not want to be subject to margining requirements and could also be operationally simpler than transacting derivatives.

If a derivative is not measured at fair value (for example, if the fair value cannot be reliably measured), then the derivative cannot be designated as a hedging instrument. [FRS 102.2A.23J]. With the exception of certain written options, the circumstances in which a derivative recorded at fair value through profit or loss may be designated as a hedging instrument are not restricted, provided the relevant conditions for hedge accounting are met. The reason written options cannot be designated as hedging instruments is because net options written by an entity do not reduce risk exposure or the potential effect on profit or loss - the potential loss on a written option could be significantly greater than the potential gain in value of a related hedged item. In contrast, a purchased option has potential gains equal to or greater than potential losses on a related hedged item and therefore has the potential to reduce profit or loss exposure from changes in fair values or cash flows. Accordingly, a purchased option can qualify as a hedging instrument.

Accordingly, determining whether an option contract or a combination of options constitutes a net written option is an important step in hedge designation, and can require judgement. Some guidance on this is given in the basis for conclusions to IFRS 9. The following factors, taken together, indicate that an instrument or combination of instruments is not a net written option:

- No net premium is received, either at inception or over the life of the combination of options - the distinguishing feature of a written option is the receipt of a premium to compensate for the risk incurred.
- Except for the strike prices, the critical terms and conditions of the written and purchased option components are the same, including underlying variable(s), currency denomination and maturity date. And
- The notional amount of the written option component is not greater than that of the purchased option component. [IFRS 9.BC6.153].

In practice many so-called 'zero cost collars' (i.e., a combination of a put and call option, one of which is purchased and the other sold, priced so that the premiums offset to zero) are transacted as legally separate written and purchased options. However, the standard includes an example of a zero-cost interest rate collar to illustrate circumstances under which a written option is combined with a purchased option such that the combination is not a net written option and hence is eligible as a hedging instrument per the second exception above). [FRS 102.12.17C].

FRS 102 also permits the foreign currency risk component of a non-derivative financial instrument (for example, a basic foreign currency loan carried at amortised cost or a lease liability or finance lease receivable within the scope of Section 20 rather than Sections 11 and 12) to be designated as a hedging instrument in the hedge of foreign currency risk. [FRS 102.12.17B].

How we see it

FRS 102 does not explicitly provide guidance on how the foreign currency risk component is determined. In practice, entities are expected to apply a similar approach to that outlined in IFRS 9, which is clear that the foreign currency component is determined using IAS 21 *Foreign Currency Transactions*.

This is shown in the following Illustration.

Illustration 14-3: Hedging using a foreign currency component of a non-derivative instrument

Company J has GBP functional currency. J issued fixed rate debt with principal of JPY 5 million due on maturity in two years. J had also entered into a fixed price sales commitment, accounted for as an executory contract, for JPY 5 million that will be paid in two years as well.

J could designate the foreign currency component (IAS 21 retranslation) of the fixed rate debt as a hedging instrument in a cash flow hedge for the foreign currency exposure associated with the future receipt of JPY 5m on the fixed price sales commitment.

Similarly, as for hedged items, a hedging instrument must be a contract with a party external to the reporting entity and there are no exceptions to this unlike for hedged items (see 4.2.1 above).

[FRS 102.12.17(b)].

4.3.2 Combinations of hedging instruments

A combination of instruments that individually meet the criteria to be treated as hedging instruments to be designated in a hedge relationship are permitted to be jointly designated in the hedging relationship. Hence a purchased bond measured at fair value through profit or loss and an interest rate swap could be jointly designated as 'the hedging instrument'. However, just a combination of derivatives such as interest rate swaps with different counterparties is a more common combination. [FRS 102.12.17A].

4.3.3 Proportions and components of instruments

FRS 102 specifies that a hedging instrument (or a combination of these instruments) can only be designated:

- In its entirety.
- As a proportion or a proportion of a combination of these instruments (e.g., 50% of the nominal amount of the instrument).

Or

- By separating the spot risk element of a foreign currency contract and excluding the forward element, or by separating the intrinsic value of an option and excluding the time value. [FRS 102.12.17A].

A combination of these approaches is also permissible, for example, it is acceptable to designate 50% of the nominal amount of a foreign currency forward contract while excluding the forward element from the hedge.

4.3.3.1 Components of instruments

The requirement to designate a hedging instrument in its entirety rather than a portion or component of it, is consistent with IFRS 9 and IAS 39. The reason given for that original guidance in IAS 39 is because there is normally a single fair value measure for a hedging instrument in its entirety and the factors that cause changes in its fair value are co-dependent. [IAS 39.74].

Similar to IFRS 9 and IAS 39, this means that the entity cannot designate a 'partial-term' component of a financial instrument as the hedging instrument. For example, in the case of a five-year interest rate swap hedging a four-year exposure, the swap payments and receipts over the next four years (i.e., ignoring those in year five) could not be designated as the hedging instrument. Instead, the whole derivative (i.e., including payments and receipts in year five) must be designated as the hedging instrument, although the hedging relationship may itself last for only four years. Likewise, components of particular cash flows in the hedging instrument cannot be designated in hedge relationships.

As noted at 10.3.1 above, for a hedge of foreign currency risk, the foreign currency risk component of a non-derivative financial instrument can be designated as a hedging instrument. [FRS 102.12.17B].

4.3.3.2 Proportions of instruments

It is possible to designate a proportion of the entire hedging instrument, such as 50% of the notional amount, in a hedging relationship. The proportion that is not designated is available for designation within other hedge relationships, such that a maximum of 100% of the notional is designated as a hedging instrument. Any proportions of an instrument not designated within hedge relationships are accounted under the usual FRS 102 classification and measurement guidance.

4.3.3.3 Options and forward contracts

The ability to separate the spot risk in a forward foreign currency contract or the intrinsic value in an option contract and exclude the forward element and time value respectively from the hedge relationship is consistent with IAS 39. [IAS 39.74]. The excluded elements of the hedging instrument (i.e., the forward element of a foreign exchange contract, or the time value of an option contract) are accounted under the usual FRS 102 classification and measurement guidance, which will be at fair value through profit or loss for derivatives.

How we see it

No prescriptive guidance is provided as to how the intrinsic value of an option must be calculated if it is designated in a hedging relationship. We believe it is acceptable to calculate the intrinsic value with respect to either the prevailing relevant spot or forward price, consistent with the risk management objective. For example, if an entity is hedging a forecast transaction, the forward price may be more relevant to the intrinsic value, however using the spot price may be operationally simpler. The chosen approach must also be documented and consistently applied for that hedge relationship.

By way of example, when using the forward price, the intrinsic value is calculated by projecting each cash flow using the relevant forward price for the relevant date and comparing that to the strike price. The result, if positive, is then discounted back to the valuation date and aggregated for all positive cash flows to form the intrinsic value of the option contract. A similar calculation is made if using the spot price, but each cash flow comparison is the prevailing spot price versus the strike price.

Changes in value of the excluded forward element in this case, are outside the hedge relationship and will be taken to profit or loss. The value of the forward element is calculated as the difference between:

- The full fair value change in the forward exchange contract.
- And
- The change in the present value of the spot risk element.

There could be some hedge relationships for which it will be easier to determine that an economic relationship exists between the hedged item and the hedging instrument if the forward element of forward contracts or time value of option contracts are excluded from the hedge relationship. For example, if based on the current market situation, the majority of fair value movements of a purchased option (designated as a hedging instrument) are expected to arise from changes in the time value, no offset will arise for changes in the time value unless the time value also exists in the hedged item (see 4.4.3 below).

IFRS 9 has additional guidance that has not been included in FRS 102. IFRS 9 includes guidance on the ability to exclude cross currency basis from a hedging instrument, and to achieve a 'cost of hedging' treatment for the excluded portions of a hedging derivative.

How we see it

Given FRS 102 paragraph 17A requires a hedging instrument to be included in its entirety, unless one of the explicit exclusions is met, we do not believe it is possible to apply the IFRS 9 guidance on excluding cross currency basis from a hedging instrument, or costs of hedging.

The exclusion of the forward element of a foreign currency contract or the time value of an option from an existing hedge relationship is a change to the documented hedged item and risk management objective. Such a change can only be accommodated by discontinuing an existing hedge relationship and starting a new one (see 4.4.2 below).

4.4 Criteria for hedge accounting

4.4.1 Introduction

In order to qualify for hedge accounting a hedging relationship has to consist of eligible hedging instruments and eligible hedged items as described at 4.2 and 4.3 above. In addition:

- The hedging relationship must be consistent with the entity's risk management objectives for undertaking hedges.
- There must be an economic relationship between the hedged item and hedging instrument.
- The entity must document the hedging relationship.
- And

- The entity must determine and document causes of hedge ineffectiveness. [FRS 102.12.18].

Each of these criteria is discussed further below.

An entity is required to discontinue hedge accounting if the conditions for hedge accounting are no longer met. [FRS 102.12.25(b)]. This means that there is an ongoing requirement to assess whether the criteria are met. We would expect entities to undertake the assessment, at a minimum, at each reporting date. If it is determined that the criteria are no longer met, then the standard says that hedge accounting is discontinued prospectively. No further guidance is provided in FRS 102 as to what is meant by 'discontinued prospectively'. IAS 39 states that hedge accounting ceases from the date the hedge relationship last met the effectiveness requirements. [IAS 39.AG113], whereas IFRS 9 states that discontinuation applies prospectively from the date on which the qualifying criteria are no longer met. [IFRS 9 Appendix B.6.5.22].

How we see it

Given the lack of guidance, in FRS 102 and the fact that IAS 39 and IFRS 9 have different requirements, we believe an accounting policy choice can be made as to the date as of which hedge accounting is discontinued.

4.4.2 Risk management objectives

Hedge accounting must reflect the entity's risk management objectives for undertaking a hedge. The risk management objective is set at the level of an individual hedging relationship and defines how a particular hedging instrument is designated to hedge a particular hedged item. For example, a risk management objective for an entity with sterling functional currency might be to designate a foreign exchange forward contract in a hedge of the foreign exchange risk of the first €1m of sales in March 2026 or to designate a particular interest rate swap in a fair value hedge of £10m fixed rate debt. If this objective for the hedge relationship changed, then hedge accounting ceases (see 4.10 below). Accordingly, the risk management objective is written in such a way that it can be determined if it has changed, and therefore whether discontinuation is required or not. [FRS 102.12.25(b)].

4.4.3 Economic relationship

FRS 102 states: [FRS 102.12.18A]

Extract from FRS 102

12.18A An economic relationship between a hedged item and hedging instrument exists when the entity expects that the values of the hedged item and hedging instrument will typically move in opposite directions in response to movements in the same risk, which is the hedged risk.

This relationship is based on an economic rationale rather than just by chance, as could be the case if the relationship is based only on a statistical correlation. Although a statistical correlation on its own is not sufficient to determine the existence of an economic relationship, it may provide corroboration of an economic rationale. That is, while correlation may support an economic rationale, causality cannot be assumed purely from correlation. As noted by the IASB "the mere existence of a statistical correlation between two variables does not, by itself, support a valid conclusion that an economic relationship exists." [IFRS 9.B6.4.6].

Where statistical correlation or other quantitative methods are applied to demonstrate the existence of an economic relationship, the standard does not provide any bright lines or other success criteria, hence judgement will be required. The assessment must be based on a sound economic rationale, rather than being driven by coincidental statistics which may not reflect a true economic relationship. In practice, an entity may have assessed the economic relationship for risk management purposes and this assessment may be appropriate for accounting purposes as well. The quantitative method chosen must be one that captures the relevant characteristics of the hedging relationship including the sources of hedge ineffectiveness.

This requirement will quite obviously be fulfilled for many hedging relationships, for example if the underlying of the hedging instrument matches or is closely aligned with the hedged risk in the hedged item. For example, an economic relationship clearly exists when hedging the 3-month SONIA variable interest rate payable on a £100,000 loan with a 3-month SONIA (pay fixed, receive floating) interest rate swap with a notional of £100,000. This is because the present value of the changes in the cash flows of the loan and the swap would move systematically in opposite directions in response to changes in the underlying interest rate. However, an economic relationship is unlikely to exist when an entity hedges a currency exposure using a different currency where the two currencies are not pegged or otherwise formally linked.

Even when there are differences between the hedged item and the hedging instrument, the economic relationship will often be capable of being demonstrated using a qualitative assessment. However, when the critical terms of the hedging instrument and hedged item are not closely aligned, it may be necessary to undertake a quantitative assessment.

IFRS 9 includes additional effectiveness criteria such as that credit risk must not dominate the hedge relationship, and an appropriate hedge ratio must be used. [IFRS 9.6.4.1(c)]. There is no expectation that these criteria must be applied for hedge accounting under FRS 102.

4.4.4 Documentation

The FRS 102 documentation requirements are intended to be relatively informal and undemanding (compared to those of IAS 39 or IFRS 9) and are not expected to pose a significant administrative burden on entities. However, appropriate documentation remains an important element of hedge accounting under FRS 102, and hedge accounting cannot be applied until the documentation criteria are met. [FRS 102.12.18(d), FRS 102.12.18(e)]. The documentation supporting the hedge relationship includes the identification of:

- The hedging instrument.
- The hedged item.
- The economic relationship between the hedging instrument and hedged item.
- The nature of the risk being hedged.
- How the hedge fits in with the entity's risk management objectives for undertaking hedges.

And

- The possible causes of hedge ineffectiveness within the hedge relationship.

Designation of a hedge relationship takes effect prospectively from the date all of the criteria for hedging are met. In particular, hedge accounting can be applied only from the date all of the necessary documentation is completed (although there are different rules for transition to FRS 102 - see Chapter 37). Hedge relationships cannot be designated retrospectively. [FRS 102.12.18].

Hedge designation need not take place at the time a hedging instrument or hedged item is entered into. For example, a derivative contract may be designated and formally documented as a hedging instrument any time after entering into the derivative contract. Similarly, a hedge relationship could commence at any point after the acquisition of a loan if the entity chooses to hedge it. However, hedge accounting will only apply prospectively from the date of documentation of the hedge designation, provided all the other conditions are met.

4.5 Hedge ineffectiveness

Hedge ineffectiveness is the difference since designation between the fair value change of a hedging instrument and the fair value change of the hedged item attributable to the hedged risk. This means the hedge relationship has not resulted in perfect offset of the risk it is meant to protect against. All hedge ineffectiveness for fair value hedges is recorded in profit or loss. For cash flow and net investment hedges, ineffectiveness is recognised in profit or loss to the extent that the cumulative change in the fair value or cash flows of the hedging instrument are greater than those on the hedged item (see 4.8.3.1 and 4.9.2 below).

Hedge ineffectiveness can arise due to several reasons and the possible causes of hedge ineffectiveness in hedge relationships must be documented by an entity at the outset. [FRS 102.12.18(e)].

When considering possible causes of ineffectiveness in a hedge relationship, mismatches between the designated hedged item and the hedging instrument are considered. For example, mismatches in the following terms are likely to be causes of ineffectiveness:

- Maturity
- Volume or nominal amount

- Cash flow dates
- Interest rate
- Other market index basis
- Quality and location basis differences
- Day count methods
- Credit risk, including the effect of collateral

Or

- The extent that the hedging instrument is already 'in', or 'out of the money' when first designated

For example, if the interest rates on the hedging instrument and hedged item differ (e.g., 3-month SONIA versus 6-month SONIA), as the two rates may not move in exactly the same way, the value of the hedging instrument and hedged item will change at different rates, leading to mismatches in cash flows and hence ineffectiveness will arise.

Similarly, if an entity hedges a forecast commodity purchase using a forward contract, unless the forward contract is for the purchase of the same quantity of the same commodity at the same time and location as the hedged forecast purchase, it won't fully match the forecast purchase and there will be some ineffectiveness. For example, if the forecast purchase is for 1,000 tonnes of copper in three months at a specified location, in order to achieve full offset the forward contract must deliver the same amount at the same time and location and be for the same quality of copper, otherwise the hedge will reduce some risk but not all of it and the difference is hedge ineffectiveness.

Furthermore, changes in the counterparty's credit risk and the value of any collateral held, will be reflected in the fair value of the hedging instrument. However, the hedged item (such as a loan or a forecast transaction) may not be affected in the same way, leading to a mismatch and therefore hedge ineffectiveness.

Another cause of ineffectiveness could be derivative valuation inputs that are not replicated when revaluing the hedged item (in addition to credit risk mentioned above). The hedged item is fair valued for the hedged risk only, whilst the hedging instrument is fair valued in its entirety. This means that ineffectiveness will arise as the hedging instrument will be fair valued for more than just the hedged risk and there will be a mismatch between the change in fair value of the hedged item and hedging instrument. For example, the hedged item might be fair valued for interest rate risk only, whilst the hedging instrument's fair value may additionally change due to factors such as liquidity.

As mentioned at 4.4.4 above, it is possible to designate a hedging instrument in a hedging relationship subsequent to its inception. For non-option derivatives, such as forwards or interest rate swaps, any fair value at inception of the hedge is likely to create 'noise' that may not be fully offset by changes in the hedged item, especially in the case of a cash flow hedge. This is because the derivative contains a 'financing' element (the initial fair value), gains and losses on the remeasurement of which will not be replicated in the hedged item and therefore the hedge contains an inherent source of ineffectiveness.

Ineffectiveness can also arise between interest rate reset dates when using hedging instruments such as interest rate swaps in fair value hedges. This is often referred to as the 'most recently fixed-floating leg' issue. The payments on the floating leg of an interest rate swap are typically 'fixed' at the beginning of a reset period and paid at the end of that period. Between these two dates the swap is no longer a pure pay-fixed receive-variable (or *vice versa*) instrument because not only is the next payment fixed, but the next receipt is also fixed. So, although fair value changes in the fixed rate hedged item may provide some offset to fair value changes in the pay fixed leg of the swap, there is no offset from the hedged item for the fair value of the most recently fixed floating leg.

4.5.1 Time value of money

Entities must consider the time value of money when measuring hedge ineffectiveness. FRS 102 is explicit that the cumulative change in fair value of the hedged item for a cash flow hedge is the present value of the cumulative change of expected future cash flows. Furthermore, for a fair value hedge the hedging gain or loss is defined as the change in fair value of a hedged item that is attributable to the hedged risk.

[FRS 102.12.23(a), FRS 102 Appendix I].

The examples of hedge accounting provided within the standard ignore the effects of discounting presumably to keep the examples simple. However, in practice an entity must determine the value of the hedged item on a present value basis thereby including the effect of the time value of money. The effect of the time value of money is also included when measuring the fair value of financial instruments and derivatives that are used as the hedging instruments as required by Section 2A *Fair Value Measurement* (see Chapter 10).

FRS 102 doesn't provide any guidance on how the time value of the hedged item is determined. However, in the case of a fair value hedge of a fixed rate bond, where the risk being hedged is a benchmark interest rate such as SONIA, the value of the bond is calculated using that same benchmark rate in order to capture the changes in the bond's value due to that specific rate. If the bond was valued using a different rate, the valuation would reflect risks other than the one being hedged.

For a cash flow hedge the discount rate does not necessarily have to match the hedged risk, but a benchmark rate is used for discounting, and the choice must be considered at the inception of the hedge relationship (see 4.4.4 above). The choice of benchmark discount rate could be a further source of hedge ineffectiveness where it differs to the discount rate used for the hedging instrument.

4.6 Hedging relationships

There are three types of hedging relationships in FRS 102, defined as follows: [FRS 102.12.19]

Extract from FRS 102

12.19 There are three types of hedging relationships:

- (a) fair value hedge: a hedge of the exposure to changes in the fair value of a recognised asset or liability or an unrecognised firm commitment, or a component of any such item that are attributable to a particular risk and could affect profit or loss.
- (b) cash flow hedge: a hedge of the exposure to variability in cash flows that is attributable to a particular risk associated with all, or a component of, a recognised asset or liability (such as all or some future interest payments on variable rate debt) or a highly probable forecast transaction and could affect profit or loss.
- (c) hedge of a net investment in a foreign operation.

These relationships are considered further in the remainder of this chapter.

4.7 Fair value hedges

4.7.1 Introduction

Typically, a fair value hedge is undertaken where an entity wishes to convert a fixed rate exposure into a variable one. The fair value of an exposure that contractually pays a fixed or 'locked in' market index, such as an interest rate or a commodity price, is sensitive to changes in that market index. By converting the fixed index into a variable one, that fair value sensitivity is reduced. In many circumstances an entity may actually be more focused on creating variable rate cash flows, rather than eliminating fair value sensitivity. However, the two economic perspectives are not dissimilar, and both fall within the FRS 102 description of a fair value hedge for accounting purposes.

An example of a fair value hedge is a hedge of the exposure to changes in the fair value of a fixed rate debt instrument (not measured at fair value through profit or loss) as a result of changes in interest rates - if interest rates increase, the fair value of the debt decreases and *vice versa*. If the debt instrument were to be sold before maturity, the fair value changes affect profit or loss. Such a hedge could be entered into either by the issuer or by the holder.

Another example of a fair value hedge is where an entity wishes to eliminate the ongoing price risk from inventory. If an entity holds 100 tonnes of commodity A as inventory, for which they paid a price of 1 per tonne, the entity may wish to protect the value of that inventory against future changes in the market price that would affect profit or loss when the inventory is sold. In this case the entity would transact a derivative to sell that inventory forward at a locked in price.

4.7.2 Hedges of firm commitments

A hedge of a fixed price firm commitment (for instance, a hedge of the change in fuel price relating to an unrecognised contractual commitment by an electricity utility to purchase fuel at a fixed price) is considered a hedge of an exposure to a change in fair value. Accordingly, such a hedge is a fair value hedge.

However, a hedge of the foreign currency risk of a firm commitment may be accounted for as a fair value hedge or as a cash flow hedge. [FRS 102.12.19A]. This is because foreign currency risk affects both fair values and cash flows. This would mean that a foreign currency cash flow hedge of a forecast transaction need not be re-designated as a fair value hedge when the forecast transaction becomes a firm commitment.

4.7.3 Accounting for fair value hedges

From the date the conditions for hedge accounting are met, a fair value hedge is accounted for as follows:

- The gain or loss on the hedging instrument is recognised in profit or loss.
- And
- The hedging gain or loss on the hedged item adjusts the carrying amount of the hedged item (if applicable). [FRS 102.12.20].

The gain or loss on the hedging instrument will be the change in its fair value since designation (subject to any excluded elements, see 4.3.3 above). Accordingly, the application of FRS 102 hedge accounting does not change the usual measurement requirements for the hedging instrument. The hedging gain or loss on the hedged item is the change in its value attributable to the hedged risk since designation, and this must be added to, or subtracted from, the carrying value of the hedged item. This has the effect that the carrying amount of the hedged item is a hybrid value. For example, in the case of debt hedged for interest rate risk, the carrying amount is a combination of amortised cost plus the change in the valuation due to changes in interest rates since hedge designation.

To the extent these amounts differ, a net amount will be recognised in profit or loss, commonly referred to as hedge 'ineffectiveness' (see 4.5 above). For fair value hedges all ineffectiveness is recognised in profit or loss.

The following Illustration shows the basic mechanics of fair value hedge accounting.

Illustration 14-4: Fair value hedge mechanics

On 1 January 2026 an investor purchases a fixed rate debt security for £100 and classified it as a basic financial instrument recorded at amortised cost (see Chapter 13). To protect the value of the investment, the investor entered into a hedge by transacting a derivative (e.g., an interest rate swap) with a nil fair value. The interest rate swap pays fixed rate and receives variable rate interest. During 2026 interest rates fall such that by the end of the year, the change in value of the fixed rate debt attributable to the hedged risk (interest rate) since designation is £10. Other factors that might influence the full fair value of the debt are not included within the hedging gain or loss, as the hedged risk is solely interest rate risk. Meanwhile, the derivative fair value has fallen by £9, resulting in a liability of that amount.

The investor records the following accounting entries:

	£	£
1 January 2026		
Dr Debt security	100	
Cr Cash		100
To reflect the acquisition of the security.		
Dr Derivative	nil	
Cr Cash		nil
To record the acquisition of the derivative at its fair value of nil.		
31 December 2026		
Dr Profit or loss	9	
Cr Derivative		9
To recognise the decrease in the derivative's fair value.		
Dr Debt security	10	
Cr Profit or loss		10
To recognise the change (increase) in value of the fixed rate debt attributable to the hedged risk		

In this example, it can be seen that ineffectiveness of £1 has been recognised as a credit to profit or loss, reflecting some mismatches between the hedged debt security and the hedging derivative.

Where the hedged item is a financial instrument for which the effective interest method of accounting is used, the adjustment to the hedged item referred to above, is amortised to profit or loss. Amortisation may begin as soon as the adjustment exists and begins no later than when the hedged item ceases to be adjusted for hedging gains and losses. The amortisation is based on a recalculated effective interest rate at the date amortisation begins. [FRS 102.12.22]. The purpose of the amortisation is:

- To reflect the effect of the fair value hedge in profit and loss.
- And
- To ensure the adjustment is fully amortised by maturity so that the carrying amount of the hedged item returns to its redemption amount on maturity.

If the fair value of the hedged component is zero when designated and the hedge relationship remains in place to its maturity, it is likely that no additional amortisation will be required as the cumulative fair value adjustment to the hedged item will naturally revert to zero through ongoing fair value hedge accounting adjustments. However, in other circumstances, such as when the fair value of the hedged component is not zero on designation and/or if the hedge relationship ends before the hedged item matures, the cumulative fair value adjustment to the hedged item will not naturally revert to zero. This means a residual amount will remain on maturity of the hedged item unless an adjustment to the effective interest rate amortisation is applied.

When the hedged item is an unrecognised firm commitment (see 4.7.2 above), the cumulative hedging gain or loss on the hedged item attributable to the hedged risk is recognised as an asset or liability with a corresponding gain or loss recognised in profit or loss. The initial carrying amount of the asset or liability that results from the entity meeting the firm commitment is adjusted to include the cumulative hedging gain or loss on the hedged item that was recognised in the statement of financial position. [FRS 102.12.20, FRS 102.12.21].

The following Illustration, based on Example 1 in the Appendix to Section 12, provides a more detailed Illustration of the mechanics of a simple fair value hedge and in particular, a fair value hedge of a firm commitment.

Illustration 14-4: Fair value hedge accounting - hedge of forward foreign currency risk of an unrecognised firm commitment

A hedge of the foreign currency risk of an unrecognised firm commitment may be accounted for as a cash flow or fair value hedge. This example illustrates fair value hedge accounting.

On 9 June 20X5 an entity with CU functional currency, enters into a purchase agreement with a third party to buy a piece of machinery in FC, a foreign currency for FC515,000. On the same day, the entity enters into a forward currency contract to buy FC500,000 for CU1,000,000. Under the purchase agreement, the machinery will be delivered and paid for on 30 March 20X6, the same day the forward currency contract is required to be settled.

In this example the hedged item is the total of the commitment of FC515,000 and the hedging instrument is the forward contract to buy FC500,000. Since the nominal amounts of the two contracts do not match, hedge ineffectiveness arises. It must be noted that in practice an entity could avoid ineffectiveness arising for this reason by identifying an amount of FC500,000 of the total commitment as the hedged item (see 4.2.2).

For simplification, this example disregards other sources of ineffectiveness, e.g., counterparty credit risk associated with the forward currency contract. Also, it is assumed that the effect of discounting is immaterial.

The entity's financial year ends on 31 December. This example assumes that the qualifying conditions for hedge accounting are met from 9 June 20X5.

The table below sets out the applicable forward exchange rates, the fair value of the forward currency contract (the hedging instrument) and the hedging gains/losses on the purchase commitment (the hedged item) on the relevant dates. This example ignores the effects of discounting.

	9 June 20X5	31 Dec 20X5	30 March 20X6
Forward exchange rate (CU:FC)	2.0:1	2.2:1	2.16:1
<i>Forward currency contract (hedging instrument)</i>			
Fair value	Nil	FC500,000 × 0.2 ¹ = CU100,000	FC500,000 × 0.16 ² = =CU80,000
Fair value change	Nil	CU100,000 - 0 = CU100,000	CU80,000 - CU100,000 = (CU20,000)

<i>Purchase commitment (hedged item)</i>			
Cumulative hedging (loss) ³	nil	$(FC515,000) \times 0.2 =$ (CU103,000)	$(FC515,000) \times 0.16$ =(CU82,400)
Hedging (loss)/gain	Nil	$(CU103,000) - 0 =$ (CU103,000)	$(CU82,400) -$ $(CU103,000) =$ CU20,600
1 0.2 is calculated as the different between the forward rates at the start date of the hedge relationship and the reporting date 2 This is the fair value of the contract prior to settlement. 3 The commitment is fair valued only for the hedged risk, which in this example is the forward exchange rate risk			

Hedge accounting:

Note that there are no hedge accounting entries on 9 June 20X5 as the forward contract is initially measured at fair value of nil and the purchase commitment is an executory contract, which remains off balance sheet until delivery of the machinery.

31 December 20X5

Accounting entries:

	Dr	Cr
Forward currency contract	CU100,000	
Profit or loss		CU100,000
To recognise the fair value gain of CU100,000 on the forward currency contract in profit or loss.		
Profit or loss	CU103,000	
Hedged item (commitment)		CU103,000
To record the cumulative hedging loss of CU103,000 on the commitment as a liability with a corresponding loss recognised in profit or loss.		

30 March 20X6

Accounting entries:

	Dr	Cr
Profit or loss	CU20,000	
Forward currency contract		CU20,000
To recognise the change in fair value loss of CU20,000 on the forward currency contract in profit or loss.		
Hedged item (commitment)	CU20,600	
Profit or loss		CU20,600
To recognise the hedging gain on the commitment since 31 December 20X5 of CU20,600 in profit or loss with a corresponding adjustment to the recognised liability from CU103,000 to CU82,400.		
Hedged item (commitment)	CU82,400	
Property, plant and equipment (PP&E)		CU82,400
To adjust the machinery's carrying amount to include the cumulative hedging loss on the hedged item of CU82,400.		

Cash CU80,000

Forward currency contract CU80,000

To reflect the settlement of the forward currency contract in cash for CU80,000 is shown above.

Property, plant and equipment (PP&E) CU1,112,400

Cash CU1,112,400

To reflect the purchase of the machinery at the applicable spot rate of CU2.16:FC1 for CU1,112,400 (settled in cash) is shown above.

The resultant accounting is that the purchased PPE is recognised at CU1,030,000 (=CU1,112,400-CU82,400). This represents the fact that CU500,000 of the purchase price was locked into an exchange rate of 2.0:1, and CU15,000 remain unhedged for foreign currency risk (a designated under hedge). In this case the designated under hedge resulted in ineffectiveness of CU2,400 loss booked in profit or loss.

Had only CU500,000 of the purchase agreement been designated as the hedged item (i.e., a nominal component - see 4.2.2), then the cumulative hedging loss on the hedged item would have been restricted to CU80,000 reflecting the foreign currency risk in the designated CU500,000. No ineffectiveness would be recognised in profit or loss.

4.8 Cash flow hedges

4.8.1 Introduction

Typically, a cash flow hedge is undertaken where an entity wishes to convert a variable rate exposure into a fixed one. An example of a cash flow hedge is the use of an interest rate swap to change floating rate debt to fixed rate debt. The cash flows being hedged are the future interest payments.

An entity with GBP functional currency may have highly probable monthly forecast sales in a foreign currency over the next year. In order to eliminate variability from changes in foreign currency risk in the highly probable forecast revenue, the entity may transact a series of foreign currency forward contracts to lock in the GBP equivalent for that revenue. This scenario is an example of a cash flow hedge of foreign exchange risk.

4.8.2 Highly probable forecast transactions

FRS 102 permits a cash flow hedge of a forecast transaction only where it is considered highly probable. [FRS 102.12.16A]. The glossary to FRS 102 defines 'highly probable' and 'forecast transaction' as: [FRS 102 Appendix I].

Term	Definition
Highly probable	Significantly more likely than probable.
Forecast transaction	Uncommitted but anticipated future transaction.

To meet the 'highly probable' criteria, entities are not required to predict and document the exact date a forecast transaction is expected to occur but must be able to identify and document the forecast transaction within a reasonably specific and generally narrow range of time from a most probable date, as a basis for determining fair values and assessing hedge effectiveness.

The high probability of a transaction must be supported by observable facts and attendant circumstances and is not to be based solely on management intent, because intentions are not verifiable. In making this assessment, entities may find it helpful to consider the following (although this is not an exhaustive list):

- The frequency of similar past transactions.
- The financial and operational ability to carry out the transaction.
- Whether there has already been a substantial commitment of resources to a particular activity, e.g., a manufacturing facility that can be used in the short run only to process a particular type of commodity.
- The extent of loss or disruption of operations that could result if the transaction does not occur.
- The likelihood that transactions with substantially different characteristics might be used to achieve the same business purpose, e.g., there may be several ways of raising cash ranging from a short-term bank loan to a public share offering.

And

- The entity's business plan.

The length of time until a forecast transaction is projected to occur is also a consideration in determining probability. Other factors being equal, the more distant a forecast transaction is, the less likely it is to be considered highly probable and the stronger the evidence that is needed to support an assertion that it is highly probable. For example, a transaction forecast to occur in five years may be less likely to occur than a transaction forecast to occur in only one year. However, forecast interest payments for the next 20 years on variable-rate debt would typically be highly probable if supported by an existing contractual obligation.

In addition, the greater the physical quantity or future value of a forecast transaction in proportion to transactions of the same nature, the less likely it is that the transaction would be considered highly probable and the stronger the evidence that would be required to support such an assertion. For example, less evidence would generally be needed to support forecast sales of 500,000 units in the next month than 950,000 units when recent sales have averaged 950,000 units for each of the past three months.

A history of having designated hedges of forecast transactions and then determining that the forecast transactions are no longer expected to occur, would call into question both the ability to accurately predict forecast transactions and the propriety of using hedge accounting in the future for similar forecast transactions. However, there are no prescriptive 'tainting' provisions in this area and entities are not automatically prohibited from using cash flow hedge accounting if a forecast transaction fails to occur. Instead, whenever such a situation arises, the particular facts, circumstances and evidence need to be assessed to determine whether doubt has, in fact, been cast on an entity's ongoing hedging strategies.

If a hedged forecast transaction is no longer considered to be highly probable, the hedge must be discontinued prospectively (see 4.4.1 above and 4.10 below).

4.8.3 Accounting for cash flow hedges

From the date the conditions for hedge accounting are met, a cash flow hedge is accounted for as follows:

- (a) The separate component of equity associated with the hedged item (cash flow hedge reserve) is adjusted to the lower of the following (in absolute amounts):
 - (i) The cumulative gain or loss on the hedging instrument from the date the conditions for hedging are met.

And

 - (ii) The cumulative change in fair value on the hedged item (i.e., the present value of the cumulative change of expected future cash flows) from the date the conditions for hedging are met.
- (b) The portion of the gain or loss on the hedging instrument that is determined to be an effective hedge (i.e., the portion that is offset by the change in the cash flow hedge reserve calculated in accordance with (a)) is recognised in OCI.
- (c) Any remaining gain or loss on the hedging instrument (or any gain or loss required to balance the change in the cash flow hedge reserve calculated in accordance with (a)), is hedge ineffectiveness that is recognised in profit or loss. The reference to 'balance' here refers to the difference between the effective part of a hedge recorded in OCI and the fair value change on the derivative.
- (d) The amount that has been accumulated in the cash flow hedge reserve in accordance with (a) above is accounted for as follows:
 - (i) If a hedged forecast transaction subsequently results in the recognition of a non-financial asset or non-financial liability, or a hedged forecast transaction for a non-financial asset or non-financial liability becomes a firm commitment for which fair value hedge accounting is applied, the entity must remove that amount from the cash flow hedge reserve and include it directly in the initial cost or other carrying amount of the asset or liability (commonly referred to as a 'basis adjustment').
 - (ii) For cash flow hedges other than those covered by (i), that amount must be reclassified from the cash flow hedge reserve to profit or loss in the same period or periods during which the hedged expected future cash flows affect profit or loss (for example, in the periods that interest income or interest expense is recognised or when a forecast sale occurs).
 - (iii) If the amount accumulated in the cash flow hedge reserve is a loss, and all or part of that loss is not expected to be recovered, the amount of the loss not expected to be recovered must be reclassified to profit or loss immediately. [FRS 102.12.23].

FRS 102 and IFRS 9 provide no further guidance on the requirement (d)(iii) above, hence a hierarchy of guidance must be considered in the selection of an appropriate accounting policy, in line with Section 10

Accounting Policies, Estimates and Errors (see Chapter 9). [FRS 102.10.4, FRS 102.10.5, FRS 102.10.6].

Accordingly, consideration is likely to be given to the guidance on the recoverability of assets which is contained in other sections such as Section 27 *Impairment of Assets* on impairment and recoverability testing of non-financial assets or Section 21 *Provisions and Contingencies* on onerous contracts. The outcome of applying these different methodologies could differ. Therefore, judgement is required in determining the most appropriate methodology based on the specific facts and circumstances of the hedge relationship.

4.8.3.1 The 'lower of' test

The cash flow hedge mechanics described in (a) to (c) above are often referred to as the 'lower of' calculation. This can be explained more easily by way of an example which is given in the illustration below.

Illustration 14-5: Cash flow hedge mechanics - 'lower of' calculation

	Scenario A	Scenario B
Change in value of the hedged item (i.e., the present value of the cumulative change of expected future cash flows)	110	100
Change in the fair value of the hedging instrument	(100)	(110)
'Lower of' exposure	Hedging instrument	Hedged item
Accounting entries:		
Other comprehensive income	Dr 100	Dr 100
Profit or loss	Nil	Dr 10
Derivative	Cr 100	Cr 110
Ineffectiveness recognised	Nil	(10)

It can be seen from the above example that, for cash flow hedges, ineffectiveness is only recognised in profit or loss to the extent that the absolute change in fair value of the hedging instrument exceeds the absolute change in fair value of the hedged item. This comparison of value changes is undertaken on a cumulative basis, i.e., the change in value over the life of the designated hedge relationship since inception.

If the hedging instrument's cumulative fair value changes are less than the cumulative fair value changes of the hedged item, no ineffectiveness is recorded in profit or loss (i.e., the full fair value change of the derivative is recorded in OCI). If the hedging instrument's cumulative fair value changes are more than the cumulative fair value changes of the hedged item, the excess is recorded as ineffectiveness in profit or loss.

4.8.3.2 The hypothetical derivative

In practice entities often use what is called the 'hypothetical derivative' method to measure ineffectiveness in a cash flow hedge. As its name suggests, the method involves creating a notional derivative (normally an interest rate swap or forward contract with no unusual terms) and a zero fair value at inception of the hedge relationship that perfectly matches the risk being hedged. The fair value of the hypothetical derivative is then used as a proxy for the net present value of the change in hedged future cash flows (requirement (a)(ii) in 4.8.3 above) against which changes in value of the actual hedging instrument are compared to measure ineffectiveness.

In determining the hypothetical derivative, the variable leg of the hypothetical swap must closely match the cash flows of the hedged item but only to the extent of the specific risk being hedged. For example, if an entity is hedging interest rate variability, the variable leg of the hypothetical swap must match the floating rate and timing of the hedged exposure. The following illustration demonstrates how a hypothetical derivative can be constructed in a cash flow hedge.

Illustration 14-6: Determination of a hypothetical derivative in a cash flow hedge of interest rate risk

Company X has purchased £200m of variable rate 5-year debt securities. The debt securities yield 1-month SONIA plus 100 basis points with coupons paid monthly. Company X wishes to mitigate cash flow variability from the debt securities by transacting a 5-year interest rate swap with £200m notional, receiving a fixed coupon of 2.0% quarterly and paying an overnight SONIA rate, compounded daily. The swap and the debt securities were acquired on the same day at prevailing market rates and designated in a cash flow hedge relationship for changes in 1-month SONIA, i.e., excluding credit risk from the debt securities.

As the hedged item and the hedging swap reference different indices, there is likely to be a difference between the hypothetical derivative and the actual hedging swap.

The hypothetical derivative representing the hedged risk in the issued debt might be determined as follows:

A 5-year interest rate swap with £200m notional, receiving 1-month SONIA, and paying a 2.02% fixed coupon monthly. The fixed coupon of 2.02% is calculated such that the hypothetical derivative has a zero fair value on the date of designation. The 2bp difference with the variable leg of the actual hedging swap reflects the difference between overnight SONIA compounding daily and 1-month SONIA.

The fact that the actual hedging derivative is referenced to overnight SONIA and cash flows occur quarterly has no impact on the determination of the hypothetical derivative. The hypothetical derivative can only be based on features that arise in the hedged item, which attracts a monthly coupon. The difference between the hypothetical derivative and the hedging derivative is likely to lead to ineffectiveness.

When an entity hedges one-sided risk, such as protection against a decline in commodity prices below a specified level (e.g., £90 per tonne), the effectiveness assessment must reflect that only part of the variability in cash flows is being hedged. In such cases, the hypothetical derivative takes the form of the intrinsic value of a hypothetical option contract to represent the one-sided risk exposure and excludes time value. This is because time value is not a component of the hedged forecast transaction and therefore cannot be considered part of the hedged item. If a purchased option is designated as the hedging instrument for a one-sided forecast transaction, the inclusion of the time value in the value of the option, but not in the hedged item, results in ineffectiveness unless it is excluded from the hedge relationship (see 4.3.3.3)

The hypothetical derivative is first determined at inception of the hedge relationship based on the critical terms of the hedged item and prevailing market rates at that time. However, if any of the critical terms of the hedged item change subsequently, e.g., timing, volume or pricing inputs, then the hypothetical derivative will need to be updated to reflect those changes, but still in consideration of the market rates at the time of designation.

The Appendix to Section 12 illustrates the use of the hypothetical derivative method to measure ineffectiveness (see Illustration 14-7 below).

4.8.3.3 Recycling

In order to meet the requirements of FRS 102 (see 4.8.3 above), consideration must be given to the nature of the hedged item. The following are some examples of how amounts recorded in OCI are subsequently recycled. [FRS 102.12.23(d)]

Illustration 14-7: Cash flow hedge mechanics - recycling

	<i>Hedge of purchase of fixed asset in foreign currency</i>	<i>Monthly forecast sale of gas</i>	<i>Floating rate debt</i>
Hedged risk	Foreign currency.	Gas price.	Interest rates.
Timing of recognition of hedged item	Purchase date.	Throughout each month.	Debt is already recognised, but interest is accrued over the remaining life of the debt.
Timing of recycling of effective portion from OCI to profit or loss	Full amount recycled and included in cost of the fixed asset when purchased (a 'basis' adjustment), subsequently recognised in profit and loss through depreciation, impairment or sale of hedged fixed asset.	The relevant component of the effective portion for each month of gas sales is recycled each month.	The relevant component of the effective portion for each hedged interest accrual is to be recycled. This is often achieved by recycling, each period, the net interest accrual on the derivative from OCI into profit or loss.

The purpose of the recycling is so that the impact of the cash flow hedge is reflected in profit or loss to match the timing of recognition of the hedged item.

How we see it

We believe the requirements imply that the reclassification from accumulated other comprehensive income to profit or loss is recognised in the same line item in profit or loss as the hedged transaction to reflect the offsetting effect of hedge accounting (see 4.11 below).

The following Illustration, based on Example 2 in the Appendix to Section 12, illustrates in more detail how to account for a cash flow hedge.

Illustration 14-8: Cash flow hedge accounting - hedge of variability in cash flows in a floating rate loan due to interest rate risk

This example illustrates the accounting for a cash flow hedge of interest rate risk associated with a floating rate loan. An entity, with sterling functional currency, borrows money at a floating rate and enters into an interest rate swap with the effect of paying a fixed rate overall.

On 1 January 20X5, an entity borrows £10,000,000 from a bank at a floating rate of 3-month (Interbank Offered Rate (IBOR) plus 2.5%. The interest is payable annually in arrears on 31 December. The loan is repayable on 31 December 20X7.

On 1 January 20X5 the entity also enters into an interest rate swap with a third party, under which it receives 6-month IBOR and pays a fixed rate of interest of 4.5%. The notional amount of the swap is £10,000,000. The swap is settled annually in arrears on 31 December and expires on 31 December 20X7.

The IBOR rates on the loan and the interest rate swap are reset and fixed annually in advance on 31 December based on the expected IBOR rates applicable at that time. Note that in practice the loan and swap interest rates would be reset and paid more frequently than assumed for the purpose of simplification in this example, in keeping with the 3-month and 6-month IBOR fixings.

The entity hedges the variability of the interest rate payments on the bank loan based on 3-month IBOR. As the entity receives interest based on 6-month IBOR under the interest rate swap, ineffectiveness will arise because the expected cash flows of the hedged item and the hedging instrument differ. The fair value of the interest rate swap may be affected by other factors that cause ineffectiveness, for example counterparty credit risk, but these have been disregarded in this example. This example also ignores the effect of discounting.

There are no transaction costs.

The entity's financial year ends on 31 December.

This example assumes that the qualifying conditions for hedge accounting are met from 1 January 20X5.

The table below sets out the applicable IBOR rates, interest payments and swap settlements. The fair values of the interest rate swap and the hedged item shown in the table are shown for illustrative purposes only.

Note that in practice, when forecast variable interest rate payments are the hedged item, the fair value of a hypothetical swap that would be expected to perfectly offset the hedged cash flows, is used as a proxy of the fair value of the hedged item. The hypothetical derivative in this scenario is a floating to fixed interest rate swap with terms that match those of the loan and a fixed rate of 4.3%, which for the purpose of this example, is the interest rate where the fair value of the hypothetical swap is nil at the inception of the hedging relationship.

	1 Jan 20X5	31 Dec 20X5	31 Dec 20X6	31 Dec 20X7
Actual 3-month IBOR	4.3%	5%	3%	n/a
Actual 6-month IBOR	4.5%	4.9%	3.2%	n/a
Interest payments based on 3-month IBOR	n/a	£10m × (4.3% + 2.5%) = £680,000	£10m × (5% + 2.5%) = £750,000	£10m × (3% + 2.5%) = £550,000
<i>Interest rate swap (hedging instrument)</i>				
Fair value ⁴	nil	£78,000	(£89,000) ¹	(£130,000) ²
Fair value change	nil	£78,000 - 0 = £78,000	(£89,000) - £78,000 = (£167,000)	(£130,000) - (£40,000) ³ - (£89,000) = (£1,000)

Swap settlement receipts/(payments) based on 6-month IBOR	n/a	$\text{£}10\text{m} \times (4.5\% - 4.5\%) = \text{nil}$	$\text{£}10\text{m} \times (4.9\% - 4.5\%) = \text{£}40,000$	$\text{£}10\text{m} \times (3.2\% - 4.5\%) = (\text{£}130,000)$
<i>Hedged item</i>				
Fair value ⁴	nil	(£137,000)	£59,000	£130,000

Key to table:

- 1: This valuation is determined before the receipt of the cash settlement of £40,000 due on 31 December 20X6.
- 2: This valuation is determined before the payment of the cash settlement of £130,000 due on 31 December 20X7.
- 3: £40,000 is the settlement of the interest rate swap as at 31 December 20X6 which affects the fair value of the swap, but is not included in the fair value of the swap at 31 December 20X6 of £89,000.
- 4: The fair values of the interest rate swap and the hedged item shown in the table are those given in Example 2 in the standard but may not reflect the market data given.

31 December 20X5

Accounting entries:

Note that the accounting entries shown are only those relevant to demonstrate the effects of hedge accounting. In practice other accounting entries are required, e.g., an entry to recognise the loan liability.

	Periodic		Cumulative	
	Dr	Cr	Dr	Cr
Interest rate swap	£78,000		£78,000	
OCI		£78,000		£78,000

The cash flow hedge reserve is adjusted to the lower of (in absolute amounts) the cumulative gain on the hedging instrument (i.e., the interest rate swap), which equals its fair value, of £78,000 and the cumulative change in fair value of the hedged item (hypothetical derivative), which equals its fair value of (£137,000).

The gain of £78,000 on the interest rate swap is recognised in OCI, with no ineffectiveness in profit or loss.

The fixed interest element on the hypothetical swap is £430,000 (i.e., $\text{£}10\text{m} \times 4.3\%$ (excluding the credit spread as not part of the hedge relationship)), the same amount as the variable rate component. The variability of 3-month IBOR did therefore not affect profit or loss during the period. The reclassification adjustment is nil. (Note that no accounting entry is shown here).

Profit or loss (interest)	£680,000		£680,000	
Cash		£680,000		£680,000

In respect of the interest payments on the loan, reflecting the full coupon of 3 Month IBOR (4.3%) plus 2.5% credit spread. Note that in practice the accrual and payment of interest may be recorded in separate accounting entries.

31 December 20X6

Accounting entries:

	Periodic		Cumulative	
	Dr	Cr	Dr	Cr
OCI	£137,000		£59,000	
Profit or loss (ineffectiveness)	£30,000		£30,000	
Interest rate swap		£167,000		£89,000

The cash flow hedge reserve is adjusted to the lower of (in absolute amounts) the cumulative loss on the hedging instrument (i.e., the interest rate swap) which equals its fair value of (£89,000) and the cumulative change in fair value of the hedged item, which equals its fair value of £59,000. The cash flow hedge reserve moves from £78,000 to (£59,000), a change of (£137,000).

A loss of £137,000 on the interest rate swap is recognised in OCI, as this is determined to be the effective portion. The remainder of the loss on the interest rate swap of £30,000 is recognised in profit or loss.

	Dr	Cr	Dr	Cr
OCI	£70,000		£129,000	
Profit or loss (interest)		£70,000	£610,000	

The fixed interest element on the hypothetical swap is £430,000, whilst the variable rate component is £500,000 (£10m × 5%). The variability of 3-month IBOR affects profit or loss during the period by £70,000. Accordingly, the reclassification adjustment is £70,000.

Profit or loss (interest)	£750,000		£1,360,000	
Cash		£750,000		£1,430,000

In respect of the interest payments on the loan (£10m × (5% + 2.5%)). Note that in practice the accrual and payment of interest may be recorded in separate accounting entries.

Cash	£40,000			£1,390,000
Interest rate swap		£40,000		£129,000

In respect of the settlement of the swap (£10m × (4.9% - 4.5%)).

31 December 20X7

Accounting entries:

	Periodic		Cumulative	
	Dr	Cr	Dr	Cr
OCI	£1,000		£130,000	
Interest rate swap		£1,000		£130,000

The cash flow hedge reserve is adjusted to the lower of (in absolute amounts) the cumulative loss on the hedging instrument (i.e., the interest rate swap) which equals the fair value of (£130,000) and the cumulative change in fair value of the hedged item, which equals its fair value of £130,000.

The cash flow hedge reserve moves from (£129,000) to (£130,000), a change of (£1,000). The loss of £1,000 on the interest rate swap is recognised in OCI.

Profit or loss (interest)	£130,000		£1,490,000	
OCI		£130,000		nil

The fixed interest element on the hypothetical swap is £430,000, whilst the variable rate component is £300,000 (£10m × 3%). The variability of 3-month IBOR affects profit or loss during the period by (£130,000). Accordingly, the reclassification adjustment is (£130,000).

Profit or loss (interest)	£550,000		£2,040,000	
Cash		£550,000		£1,940,000

In respect of the interest payments on the loan (£10m × (3% + 2.5%)). Note that in practice the accrual and payment of interest may be recorded in separate accounting entries.

Interest rate swap	£130,000		nil	
Cash		£130,000		£2,070,000

For illustrative purposes the accounting entry for the settlement of the swap is shown above (£10m × (3.2% - 4.5%)).

The table below summarises the effects of the accounting entries shown above on the interest rate swap, profit or loss and other comprehensive income.

Description	Interest rate Swap	Other comprehensive income	Profit or loss
	£	£	£
<i>31 December 20X5</i>			
Opening balance	nil	nil	-
Interest on the loan			680,000
Interest rate swap fair value movement	78,000	(78,000)	-
Closing balance	78,000	(78,000) ¹	680,000
<i>31 December 20X6</i>			
Opening balance	78,000	(78,000) ¹	680,000
Interest on the loan			750,000
Interest rate swap fair value movement	(167,000)	137,000	30,000 ²
Settlement receipt interest rate swap	(40,000)	-	-
Reclassification from cash flow hedge reserve	-	70,000	(70,000)
Closing balance	(129,000)	129,000 ¹	1,390,000
<i>31 December 20X7</i>			
Opening balance	(129,000)	129,000 ¹	1,390,000
Interest on the loan			550,000
Interest rate swap movement	(1,000)	1,000	-
Settlement receipt interest rate swap	130,000	-	-
Reclassification from cash flow hedge reserve	-	(130,000)	130,000
Closing balance	nil	nil ¹	2,070,000

1 This is the balance of the cash flow hedge reserve.

2 Ineffectiveness

By the end of the hedge, there are no amounts left in the cash flow hedge reserve reflecting the fact that the cumulative gains and losses on the swap have been transferred to profit or loss to offset the hedged interest payments. As a result, the entity's net interest income profile reflects a relatively fixed rate through the period of the hedge (subject to ineffectiveness recognised) despite the underlying loan being floating rate.

4.9 Hedges of net investments in foreign operations

4.9.1 Introduction

Many reporting entities have investments in foreign operations which may be subsidiaries, associates, joint ventures or branches. Section 30 *Foreign Currency Translation* requires an entity to determine the functional currency of each of its foreign operations as the currency of the primary economic environment of that operation. When translating the results and financial position of its foreign operation into a presentation currency, on consolidation foreign exchange differences are recognised in other comprehensive income (with no reclassification to profit or loss in future periods). [FRS 102.30.13].

From the perspective of an investor (e.g., a parent) it is clear that an investment in a foreign operation is likely to give rise to a degree of foreign currency exchange rate risk and an entity with many foreign operations may be exposed to a number of foreign currency risks.

FRS 102 defines a net investment in a foreign operation as “The amount of the reporting entity’s interest in the net assets of that operation”. [FRS 102 Appendix I]. A hedge of a net investment in a foreign operation is a hedge of the foreign currency exposure, not a hedge of the change in the value of the investment.

How we see it

Although the definition of a net investment in a foreign operation is described with reference to net assets, there is nothing within the guidance to suggest that a hedge of negative net assets would be precluded. This is because the objective of a net investment hedge is to manage foreign currency risk arising from the translation of the net investment, and that foreign currency risk arises irrespective of whether the net assets are negative or positive.

The net investment hedge accounting rules can also be applied to a monetary item that is accounted for as part of the net investment (see Chapter 32). For example, if a parent grants a foreign currency loan to an overseas subsidiary and settlement is neither planned nor likely in the foreseeable future, the loan can be hedged as part of the net investment in the foreign subsidiary.

Net investment hedge accounting can be applied only when the net assets of the foreign operation (and not fair value or cost less impairment) are included in the financial statements. This will be the case for consolidated financial statements, financial statements in which investments such as associates or joint ventures are accounted for using the equity method or those that include a branch or a joint operation. Investments in foreign operations may be held directly by a parent entity or indirectly by its subsidiary or subsidiaries. Accordingly, it is also possible to achieve net investment hedge accounting of a foreign branch in an entity’s standalone financial statements under FRS 102, if the other requirements for hedge accounting are met, as confirmed in April 2015 when the FRC issued *FRS 102 - Editorial amendments and clarification statements*.

4.9.2 Accounting for net investment hedges

Hedges of a net investment in a foreign operation, including a hedge of a monetary item that is accounted for as part of the net investment, are accounted for similarly to cash flow hedges from the date the conditions for hedging are met:

- The portion of the gain or loss on the hedging instrument that is determined to be an effective hedge is recognised in other comprehensive income.
- And
- The ineffective portion is recognised in profit or loss.

The effective portion is determined by applying the same cash flow hedge ‘lower of’ accounting, as explained at 4.8.3 above. However, the cumulative gain or loss on the hedging instrument relating to the effective portion of the hedge that has been accumulated in equity is not reclassified from equity to profit or loss in subsequent periods. [FRS 102.12.24]. This ensures consistency with Section 30 which requires that foreign exchange gains and losses relating to the consolidation of a subsidiary are not recycled on disposal of the subsidiary. [FRS 102.30.13].

The following Illustration, based on the Appendix to Section 12, illustrates how to account for a simple net investment hedge.

Illustration 14-8: Hedge accounting: net investment in a foreign operation

On 1 April 20X5 an entity with sterling functional currency acquires an investment in an overseas subsidiary (with functional currency FC) at a cost of FC1,200,000. On the same day, the entity takes out a loan with a third party of FC1,200,000 to finance the investment. This example disregards the effects of interest or other transaction costs associated with the loan.

This example assumes that the foreign operation makes losses of FC200,000 in 20X5 and profits of FC100,000 in 20X6. The reduction in value below FC1,200,000 causes ineffectiveness.

The entity's financial year ends on 31 December.

This example assumes that the qualifying conditions for hedge accounting are met from 1 April 20X5.

The table below sets out the applicable exchange rates, the carrying amount of the loan and the foreign exchange gains and losses on the loan, as well as the retranslation differences on the foreign investment recognised in OCI in accordance with Section 30 (see Chapter 32).

	1 April 20X5	31 December 20X5	31 December 20X6
Spot exchange rate £:FC	0.35:1	0.3:1	0.45:1
<i>Loan (hedging instrument)</i>			
	£	£	£
Carrying amount	420,000 (= FC1,200,000 × 0.35)	360,000 (= FC1,200,000 × 0.3)	540,000 (= FC1,200,000 × 0.45)
Cumulative gain/(loss)	nil	60,000 (= 420,000 - 360,000)	(120,000) (= 420,000 - 540,000)
Periodic gain/(loss)	nil	60,000 (= 420,000 - 360,000)	(180,000) (= 360,000 - 540,000)
<i>Investment in foreign operation (hedged item)</i>			
Translation effect of profit or loss in the period at the date of the transactions and assets and liabilities at the closing rate	nil	5,000 ¹ (= FC200,000 × (0.35 - 0.325))	7,500 ² (= FC100,000 × (0.3 - 0.375))
Translation of the opening net assets at the closing rate	nil	(60,000)	150,000 ³
Total retranslation gain/(loss)	nil	(55,000)	157,500
Cumulative retranslation gain/(loss)	nil	(55,000) (= (55,000) + nil)	102,500 (= (55,000) + 157,500)

1 The calculation is based on the translation of the FC200,000 loss at the average rate of 0.325 £:FC. [FRS 102.30.20(a)].

2 The calculation is based on the translation of the FC100,000 profit at the average rate of 0.375 £:FC. [FRS 102.30.20(a)].

3 The calculation is based on the opening net assets of FC1,000,000, after the losses of FC200,000 during 20X5. [FRS 102.30.20(b)].

31 December 20X5

A component of equity is adjusted to the lower of (in absolute amounts) the cumulative exchange gain on the loan of £60,000 and the cumulative retranslation difference on the net investment of (£55,000).

A gain of £55,000 is recognised in OCI, with the remainder of the gain on the loan of £5,000 is recognised in profit or loss.

Accounting entries:

Note that only the accounting entry in relation to net investment foreign currency retranslation and hedge accounting are shown. Other accounting entries in relation to the loan and the investment in the foreign operation are required in practice.

	Dr	Cr
	£	£
Loan	60,000	
OCI		55,000
Profit or loss		5,000

31 December 20X6

A component of equity is adjusted to the lower of (in absolute amounts) the cumulative exchange loss on the loan of £120,000 and the cumulative exchange difference on the net investment of £102,500.

The amount recorded in equity changes from £55,000 to (£102,500), a change of (£157,500). A loss of £157,500 is recognised in OCI, and the remainder of the loss on the loan of £22,500 is recorded in profit or loss.

Accounting entries:

	Dr	Cr
	£	£
OCI	157,500	
Profit or loss	22,500	
Loan		180,000

In the above illustration the full translation effect of the net investment was considered with respect to hedge accounting, however this will not always be the case. If the entity had instead designated a loan of FC1,000,000 and an amount of FC1,000,000 of the net investment as the hedged item, then only the translation effect of FC1,000,000 of net investment would be considered when calculating the lower of the cumulative exchange gain on the hedging instrument and the cumulative retranslation difference on the net investment. Hence only cumulative losses that reduce the net investment to below FC1,000,000 would result in ineffectiveness.

4.10 Discontinuing hedge accounting

Hedge accounting must be discontinued prospectively if any of the following occurs:

- The hedging instrument expires, is sold or terminated.
- The conditions for hedge accounting are no longer met (see 4.4 above).

Or

- The entity elects to discontinue the hedge. [FRS 102.12.25].

If the entity elects to voluntarily discontinue a hedge, it must document its decision, and the discontinuation is effective prospectively from that date.

The conditions for hedge accounting include a requirement that the hedge relationship is consistent with the entity's risk management objective for undertaking hedges. If that objective changes, then the condition is no longer met, and the hedge relationship must be discontinued. Similarly, if the documented hedged risk, hedged item or hedging instrument no longer exists, or have been replaced with an alternate, then hedge accounting for that hedge relationship must cease prospectively.

In many cases it will be straight forward to determine whether the hedged item exists or not, but in all cases that determination will need to be made with respect to the documented description of the hedged item made on initial designation. The designation and documentation of a hedge relationship play an important role in defining the boundaries of what is being hedged but also the timing of the expected cash flows or exposures. For example, a hedged item might be defined as highly probable sales of \$100,000 in May, June and July of 20X2 as hedged items in a cash flow hedge of the risk of changes in foreign currency rates. If those forecast sales are now expected to be nil in that period, the hedged item, as documented, no longer exists because the hedged item was defined by its timing and a change in the timing would redefine the hedged item such that it is different to the original documented hedged item. The hedge would be discontinued.

By contrast, if the hedged forecast transaction is the highly probable sale of a bespoke luxury yacht, the time period in which the forecast sale is expected to occur must be identified and documented within a reasonably specific and generally narrow range of time from a most probable date in order to determine that the forecast transaction is highly probable. However, a change in the estimate of the timing of the sale of a bespoke luxury yacht does not of itself redefine the hedged item. If the sale is still highly probable the original hedged item will continue to exist and hedge accounting could continue.

Following discontinuation in a fair value hedge of a financial instrument, any adjustment to the hedged item arising as a result of fair value hedging, is amortised as discussed at 4.7.3 above, or written off to profit or loss if the hedged item no longer exists. If the hedged item is not a financial instrument, the entity ceases to make any further adjustment arising from a hedging gain or loss on the hedged item. [FRS 102.12.25A].

In a cash flow hedge, if the hedged future cash flows are no longer expected to occur, the amount that has been accumulated in the cash flow hedge reserve is reclassified from the cash flow hedge reserve to profit or loss immediately. [FRS 102.12.25A].

If cash flow hedge accounting is discontinued and the hedged future cash flows are still expected to occur (for example a future cash flow that is no longer highly probable may still be expected to occur), the cumulative gain or loss in the cash flow hedge reserve either:

- Remains in equity and is recycled to profit or loss in line with 4.8.3(d) above.
- Or
- Is recorded in profit or loss immediately if the amount is a loss and is not expected to be recovered. [FRS 102.12.23(d)].

In a net investment hedge, the amount that has been accumulated in equity is not reclassified to profit or loss. [FRS 102.12.25A].

A new hedge relationship may be designated in order to achieve hedge accounting prospectively, once all the conditions are met.

4.10.1 Rollover strategies

IAS 39 and IFRS 9 sometimes permit a hedging relationship to continue where a hedging instrument is 'rolled-over', replacing an expired or terminated hedging instrument. For example, both standards state that an entity must discontinue hedge accounting if the hedging instrument "expires or is sold, terminated or exercised...the replacement or rollover of a hedging instrument is not an expiration or termination if such replacement or rollover is part of the entity's documented hedging strategy". [IFRS 9.6.5.6, IAS 39.101(a)].

Similarly, FRS 102 states that an entity must discontinue hedge accounting if the hedging instrument has "expired, is sold, terminated or exercised". However, FRS 102 is silent on the issue of rollover strategies. The absence of guidance in FRS 102 does not mean that the guidance in IFRS automatically applies and in this situation, it would appear the difference in the two standards is deliberate. FRS 102 is a simplification of IFRS, and it was not intended that every rule in IFRS would apply to entities applying FRS 102. Hence, under FRS 102, a hedge relationship is discontinued when the hedging instrument expires regardless of whether the instrument is rolled over.

4.10.2 Novation of derivatives

IAS 39 and IFRS 9 both contain guidance on dealing with novation of derivatives that are part of a hedging relationship - the guidance was added following an IFRS IC discussion on the topic of mandated novation of derivatives to a central clearing party. A novation in this context is the act of replacing an existing counterparty to a derivative with a new party, such that all the obligations to the derivative contract must now be performed by the new party. The IFRS IC confirmed that a change in the counterparty of a derivative results in derecognition of the derivative. As noted at 4.10.1 above, it follows therefore that a hedge relationship is discontinued if the derivative is novated, unless the change in counterparty is part of a documented replacement strategy or roll over strategy. IAS 39 was amended to include an additional exception such that a novation of a derivative in a hedge relationship does not result in discontinuation of the hedge relationship if the novation was as a consequence of laws or regulation requiring a change to a central clearing counterparty. The same guidance also appears in IFRS 9.

The basis for conclusions for IAS 39 explains the principle of why a derivative is derecognised when it is novated to another counterparty: financial assets are derecognised when the contractual rights to the cash flows expire; whilst financial liabilities are extinguished when the debtor is legally released from primary responsibility for the liability. In a novation, both of these conditions are met. These conditions are also set out in FRS 102 implying that a derivative that is novated under FRS 102 will be derecognised and the existing hedge will be terminated. [FRS 102.11.33, FRS 102.11.36].

How we see it

However, unlike IAS 39, FRS 102 does not contain the 'exception' for novations that are part of a documented hedging strategy or with a central clearing counterparty. Therefore, in our view, novations result in termination of the hedging relationship under FRS 102.

An entity might be required to, or choose to, novate a hedging instrument from one entity within a consolidated group, to another entity within the same group. For example, a banking group might undertake an internal reorganisation such that a portfolio of derivatives is transferred into a different entity within the same banking group. In this instance a question arises as to whether such a change in hedging derivative counterparty will result in the discontinuation of a hedge relationship. In line with the discussion above, when a derivative is novated or transferred to a different counterparty, the entity that originally held the derivative, derecognises the derivative. Whilst the hedged item remains within the hedging entity, the change in counterparty means the original hedging instrument no longer exists from the entity's perspective. As a result, the existing hedge relationship would ordinarily be de-designated and re-designated. However, the appropriate treatment will depend on the specific facts and circumstances.

4.10.3 Interest rate benchmark reform

As a result of the reforms mandated by the Financial Stability Board following the Financial Crisis, regulators pushed for Interbank Offered Rates (IBORs) to be replaced by new 'official' benchmark rates, known as Risk Free Rates (RFRs), a process referred to as 'IBOR Reform'. For instance, in the UK, the new official benchmark is Sterling Overnight Interest Average (SONIA) and banks are no longer required to quote LIBOR. IBOR Reform is substantially complete as the most significant IBORs, including all the LIBORs, have now ceased and have been replaced. However, there remain some local IBORs for which the work to replace them is still in progress or has only very recently been completed. For those remaining IBORs still in the process of change, the change affects future cash flows in both contractual floating rate financial instruments currently referenced to IBOR, and highly probably forecast transactions for which IBOR is designated as the hedged risk.

IBOR Reform raises a number of accounting questions, many of which relate to hedge accounting. The IASB responded with two separate amendments to IFRS: Phase 1 and Phase 2 Amendments addressing the accounting consequences that arise during the period before and after financial instruments transition from referencing IBORs to referencing replacement benchmark interest rates. Once IBOR Reform is complete and the RFRs have become established in the market, the Phase 1 and Phase 2 amendments will cease to be required.

In line with the IASB's approach, the FRC issued corresponding amendments to FRS 102. [FRS 102.12.25B-V]. These amendments reflect the temporary reliefs introduced by the IASB. For further details, please refer to the EY publication, International GAAP®.

4.11 Presentation

FRS 102 does not address how hedges are presented in profit or loss in the financial statements. IFRS reporters normally try to reflect the effect of the hedged item and hedging instrument in the financial statements so that they offset.

How we see it

For derivatives designated in effective hedge relationships, the profit or loss related to the effective portion of the hedging instrument is normally presented in the same line that the profit or loss arising on the hedged item is recorded. However, this is not mandated. It would also be acceptable to present the profit or loss from hedging derivatives similarly to non-hedging derivatives, if an entity so chooses as its accounting policy.

If a hedge does not qualify for hedge accounting, the profit or loss arising on the derivative is not necessarily presented in the same income or expenditure line as the item that it was intended to hedge. The default is for the gain or loss to be recorded in trading income.

However, gains or losses on interest rate derivatives are sometimes presented in interest income or expense. Also, gains and losses on currency derivatives may be presented in the foreign currency revaluation income or expense line. Presentation may be appropriate in cost of goods sold if the entity does not enter into derivatives for trading purposes and, hence, does not have a line item for trading instruments.

Presentation policies must be applied consistently to all similar instruments and clearly described in the accounting policies.

5 Summary of GAAP differences

The following table shows the differences between FRS 102 and IFRS for hedge accounting.

	FRS 102	IFRS 9/IAS 32/IAS 39
Accounting policy choice	Option to apply the recognition and measurement requirements of Sections 11 and 12, IAS 39 (limited option for first-time adopters of FRS 102) or IFRS 9 (see Chapter 37 for the detail). No matter the option chosen, entities must apply disclosure requirements of Sections 11 and 12.	Option to apply hedge accounting requirements of IAS 39 in full.
Hedge accounting	Similar principles to IFRS 9 but simpler. Does not include rebalancing, aggregated exposures or costs of hedging. Hedge accounting can be discontinued voluntarily unlike IFRS 9.	IAS 39: Rules based standard IFRS 9: Uses IAS 39 as the basis for the mechanics of hedge accounting, but more principled approach with additional features such as rebalancing, aggregated exposures and costs of hedging. Hedge accounting cannot be discontinued voluntarily unlike IAS 39 and FRS 102.
Hedged items - risk components	Risk components permitted for financial and non-financial instruments.	IAS 39: Only for financial items. IFRS 9: Similar to FRS 102.
Hedging instruments - non derivatives	Based on simplified version of IFRS 9. Non-derivative financial assets or liabilities at FVTPL are eligible as hedging instruments. The FX risk component of a non-derivative may be a hedging instrument.	IAS 39: Non-derivatives may be hedging instruments only for FX risks. IFRS 9: Similar to FRS 102.
Hedge effectiveness assessment	Prospective only, could be qualitative in many instances. A simpler version of IFRS 9 approach, does not require consideration of hedge ratio or whether credit risk dominates.	IAS 39: A quantitative retrospective and prospective test is required (80%-125%). IFRS 9: Prospective assessment only, likely to be qualitative in many instances.
Hedges of a net investment	Gain or loss accumulated in equity is not recycled to profit or loss on disposal of the foreign operation.	IAS 39 and IFRS 9: Gain or loss accumulated in equity is recycled to profit or loss on disposal of the foreign operation.

Appendix A - Defined terms

Extract from FRS 102

Appendix I Glossary

firm commitment	A binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates.
forecast transaction	An uncommitted but anticipated future transaction.
hedging gain or loss	The change in fair value of a hedged item that is attributable to the hedged risk.
highly probable	Significantly more likely than probable.
net investment in a foreign operation	The amount of the reporting entity's interest in the net assets of that operation
probable	More likely than not.

	Appendix A - Defined terms	641

Overview

This Chapter summarises the presentation and disclosure requirements within Section 11 *Basic Financial Instruments*, Section 12 *Other Financial Instruments Issues* and the additional disclosures for financial institutions as set out in Section 34 *Specialised Activities*. Section 11 and 12 apply to both financial and non-financial institutions. Additional disclosures for all entities reporting under UK company law are also discussed below.

The disclosure requirements under Section 11 also apply to those instruments under the scope of Section 12. There are some exemptions available for qualifying entities as defined under Section 1 *Scope* discussed at 4.1.3 below. The offsetting requirements of financial assets and liabilities are discussed at 3.2 below. The classification of financial instruments as equity or financial liabilities, as prescribed by Section 22 *Liabilities and Equity*, is covered in Chapter 12. The classification of financial assets is addressed in Chapter 13.

In the Periodic Review 2024, the FRC added disclosure requirements for supply chain financing and reverse factoring arrangements, see Chapter 7 at 2.4. These new disclosure requirements aim to enhance the transparency and usefulness of the information provided for such arrangements.

What you need to know

- The measurement basis (or bases) and other material accounting policies used for financial instruments are required to be disclosed by Section 11.
- Section 34 sets out additional disclosure requirements for financial institutions.
- Section 11 requires disclosures to be provided to enable users of the entity's financial statements to evaluate the significance of financial instruments for its financial position and performance.
- To offset two or more financial instruments in the statement of financial position, Section 11 and 12 require that an entity must currently have a legally enforceable right of set-off, and an intention to settle on a net basis or realise the asset and settle the liability simultaneously.
- New disclosures have been added to explain the inputs, assumptions and estimation techniques used to determine expected credit losses where an entity is applying IFRS 9 *Financial Instruments*. It must be noted that the FRC took the decision not to introduce an expected credit loss model for financial assets into FRS 102 and therefore entities applying Section 11 and Section 12 will continue to apply an incurred loss model in accounting for financial asset impairment.

1 Introduction

Section 11 and Section 12 contain the accounting and disclosure requirements for financial instruments. Section 34 contains additional disclosure requirements for financial instruments that apply to financial institutions. For UK companies, additional disclosures on financial instruments are required by Schedule 1 to 3 of The Large and Medium-sized Companies and Groups (Accounts and Reports) Regulations 2008 (SI 2008/410) (hereafter The Regulations).

The FRC issued an updated version of FRS 102 in September 2024, following the issue of the Amendments to FRS 102 - *The Financial Reporting Standard applicable in the UK and Republic of Ireland - Periodic Review 2024* - issued in March 2024 (the 'Periodic Review 2024'). The Periodic Review 2024 includes amendments to Sections 11, 12 and 34 of FRS 102 as issued in January 2022.

The main amendments are as follows:

- The requirements in Section 11 have been clarified to state that the disclosures set out in Section 11 also apply to those financial instruments under the scope of Section 12. [FRS 102.11.39A, FRS 102.12.26].
- Paragraph 40 of Section 11 has been amended to explicitly require disclosure of material accounting policy information consistent with the requirements in Section 3. [FRS 102.11.40].
- Entities that have made the accounting policy choice to apply IFRS 9, are now required to provide additional disclosure regarding quantitative and qualitative information on amounts arising from expected credit losses. [FRS 102.11.48ZA, FRS 102.11.48ZB].
- The disclosure requirements for financial instruments at fair value through profit or loss have been clarified to distinguish those relating to UK and those relating to the Republic of Ireland entities. [FRS 102.11.48A].
- The references to London Interbank Offered Rate (LIBOR) have been updated to Interbank Offered Rate (IBOR).

The above amendments are mandatory for accounting periods beginning on or after 1 January 2026. However, it must be noted that the disclosure requirements for supplier finance arrangements requirements in Section 7 *Statement of Cash Flows* are mandatory for accounting periods beginning on or after 1 January 2025, see Chapter 7 for further information.

2 Comparison between Sections 11, 12, 34 and IFRS

The comparable extant IFRSs are IAS 32 Financial Instruments: Presentation, IFRS 7 Financial Instruments: Disclosures and IFRS 13 *Fair Value Measurement*. Overall, the disclosure requirements in FRS 102 for financial instruments are less onerous than those of IAS 32, IFRS 7 and IFRS 13 (see 5 below).

3 Requirements of Sections 11 and 12

3.1 Scope

This chapter addresses the presentation and disclosure requirements outlined in Sections 11 and 12. It is important to note that there are certain types of financial instruments that are exempt from these sections, for more details see Chapter 11 at 3.2. Additionally, this chapter covers other disclosure requirements for financial instruments, including those for financial institutions as specified in Section 34, and the disclosure requirements of Schedule 1 to 3 to The Regulations.

3.2 Offsetting of financial instruments

3.2.1 Requirements

The rules regarding the offsetting, sometimes referred to as 'netting', of a financial asset and a financial liability are contained in both Sections 11 and 12. However, the guidance is identical in both sections, that is, a financial asset and a financial liability must be offset and the net amount presented in the statement of financial position when and only when, an entity: *[FRS 102.11.38A, FRS 102.12.25W]*

- Currently has a legally enforceable right to set off the recognised amounts.
- And

- Intends either to settle on a net basis, or to realise the asset and settle the liability simultaneously.

The offsetting principle set out above is identical to that in IAS 32, but without the additional guidance contained in IAS 32. The IASB decided to incorporate additional guidance into IAS 32 to deal with historical ambiguities as well as emerging practical application issues arising from the growth in the clearing of financial instruments. The additional guidance has helped to clarify aspects such as current legal enforceability and simultaneous settlement. We would expect FRS 102 reporters to default to the guidance within IAS 32, where helpful, but this would not in itself be a requirement. Further information on offsetting under IAS 32 can be found in the EY publication, International GAAP®.

The effect of the offsetting rules described above is that, when the requirements are met, the entity presents a single financial asset or financial liability which represents the net cash flow intended to be received or paid. When the requirements are not met, the financial asset and the financial liability must be presented separately.

3.2.2 Interaction with derecognition rules

It is worth clarifying that offsetting and derecognition are different. Offsetting does not result in derecognition of the financial asset or liability from the statement of financial position, but in their net presentation in the statement of financial position as either a net financial asset or a net financial liability. Offsetting does not have an impact on the income statement as there is no gain or loss arising from the net presentation.

When a transfer of financial assets does not qualify for derecognition (e.g., the entity has retained significant risks and rewards of ownership of the transferred asset), the entity must recognise an associated liability as discussed in Chapter 13 at 7.2.3.B. In such cases, the financial asset retained in the statement of financial position and the resulting financial liability cannot be offset. *[FRS 102.11.34]*.

3.2.3 Presentation of equity

The presentation of the increase in equity arising on the issue of shares or other equity instruments is discussed in Chapter 12 at 4.4.3.

3.3 Presentation of hedges

Further information on presentation of hedges is discussed in Chapter 14 at 4.11.

4 Disclosures required by Section 11, 12, 34 including related UK company law

4.1 Disclosures

4.1.1 Introduction

The disclosures contained in Section 11 are also applicable to financial instruments within the scope of Section 12, where relevant. [FRS 102.12.26]. The disclosure requirements of Sections 11 and 12 apply to all entities regardless of their accounting policy choice for recognition and measurement of financial instruments (see Chapter 13 at 3). These disclosures apply to all entities, even those that do not prepare financial statements in accordance with UK company law.

However, a qualifying entity which is not a financial institution (i.e., most subsidiaries and parents in their separate financial statements) is not required to make all of the disclosures required by Sections 11 and 12, providing that equivalent disclosures are included in the consolidated financial statements in which the entity is included. [FRS 102.1.8, FRS 102.1.9, FRS 102.1.12(c)]. For the list of exemptions available for a qualifying entity that is not a financial institution and that is not required to prepare Companies Act accounts, see 4.1.3 below. [FRS 102.1.9].

IFRS 7 requires disclosure regarding the expected credit loss approach to impairment of financial assets as required by IFRS 9. The Periodic Review 2024 introduced new requirements within paragraphs 11.48ZA and 11.48ZB. These requirements ensure that entities applying the recognition and measurement requirements of IFRS 9, as outlined in the accounting policy choice discussed in Chapter 13, provide relevant information about the impairment of financial assets (see 4.1.2 below). [FRS 102.BC.B11.49ZA].

When the risks arising from financial instruments are particularly significant to the business of the entity, additional disclosure may be required in relation to the statement of financial position, see 4.1.2 below.

The disclosure requirements are summarised in 4.1.2 to 4.1.7 below:

- The disclosure requirements for entities that do not take the qualifying entity exemptions are at 4.1.2 below.
- The disclosures exemptions available to qualifying entities are discussed at 4.1.3 below.
- The additional disclosures applicable to financial institutions according to Section 34 are at 4.1.4 below.
- The disclosure requirements under Section 11 that may be influenced by climate-related matters is discussed at 4.1.5 below.
- The additional disclosures applicable to entities reporting under UK company law are at 4.1.6 and 4.1.7 below.

4.1.2 Disclosure requirements of Section 11 and 12

The disclosure requirements as set out in Sections 11 and 12 are discussed below.

4.1.2.A Accounting policies

The requirement is to disclose material accounting policy information (see Chapter 6 at 7.2), “including the measurement basis (or bases) for financial instruments used in preparing the financial statements (including the accounting policy choice made in accordance with paragraph 11.2)”. [FRS 102.11.40].

4.1.2.B Statement of financial position - categories

The standard requires separate disclosure of the carrying amounts at the reporting date of:

- Financial assets measured at fair value through profit or loss.
- Financial liabilities measured at fair value through profit or loss. Those that are not held as part of a trading portfolio and are not derivatives must be shown separately. [FRS 102.11.41].

This disclosure may be made separately by category of financial instrument.

Information that enables users of an entity's financial statements to evaluate the significance of financial instruments for its financial position and performance must also be disclosed. For example, for long-term debt, such information would normally include the terms and conditions of the debt instrument (such as interest rate, maturity, repayment schedule, and restrictions that the debt instrument imposes on the entity). When the risks arising from financial instruments are particularly significant to the business (for example because they are principal risks for the entity), additional disclosure may be required.

[FRS 102.11.42].

The disclosure requirements for financial institutions discussed at 4.1.4 below, include examples of disclosure requirements for risks arising from financial instruments that may be relevant in such cases.

[FRS 102.11.42, FRS 102.34.19].

In order to comply with the above, an entity that has taken the accounting policy choice to apply the recognition and measurement provisions of IAS 39 or IFRS 9 may need to consider additional disclosures based on IFRS 7, as it relates to the recognition and measurement policies applied. [FRS 102.BC.B11.50].

However, it must be noted that following the Periodic Review 2024 amendments which are effective from 1 January 2026, the option to elect the recognition and measurement provisions of IAS 39, which were applicable prior to the issuance of IFRS 9, has now been restricted and cannot be elected either on transition to FRS 102 or through a voluntary change in accounting policy. This accounting policy can only be newly adopted if it ensures consistency with the consolidated financial statements that include the entity. Entities that have already implemented this policy may continue to apply it, see Chapter 13 at 3.2.2.

The option to apply the recognition and measurement provisions of IFRS 9 remains available. However, when this option is selected, the amendments have mandated additional disclosure requirements, see quantitative and qualitative information about amounts arising from expected credit losses at 4.1.2.G below.

For all financial assets and financial liabilities measured at fair value, the basis for determining fair value (e.g., quoted market price in an active market or a valuation technique) must also be disclosed. And when a valuation technique is used, the assumptions applied in determining fair value for each class of financial assets or financial liabilities must be disclosed. For example, if applicable, information about the assumptions relating to prepayment rates, rates of estimated credit losses, and interest rates or discount rates. [FRS 102.11.43].

Disclosure of the fact that a reliable measure of fair value is no longer available for any financial instrument that would otherwise be required to be measured at fair value through profit or loss, if that is the case, and the carrying amount of those financial instruments. [FRS 102.11.44].

4.1.2.C Transferred financial assets that do not qualify for derecognition

If an entity has transferred financial assets to another party in a transaction that does not qualify for derecognition (see Chapter 13 at 7.2.3B), the following disclosure is required for each class of such financial assets: [FRS 102.11.45]

- The nature of the assets.
 - The nature of the risks and rewards of ownership to which the entity remains exposed.
- And
- The carrying amounts of the assets and of any associated liabilities that the entity continues to recognise.

4.1.2.D Collateral

When an entity has pledged financial assets as collateral for liabilities or contingent liabilities, the following must be disclosed: [FRS 102.11.46]

- The carrying amount of the financial assets pledged as collateral
- And
- The terms and conditions relating to its pledge

4.1.2.E Defaults and breaches on loans payable

For loans payable recognised at the reporting date for which there is a breach of terms or default of principal, interest, sinking fund, or redemption terms that has not been remedied by the reporting date, disclosure is required of: *[FRS 102.11.47]*

- Details of that breach or default.
 - The carrying amount of the related loans payable at the reporting date.
- And
- Whether the breach or default was remedied, or the terms of the loans payable were renegotiated, before the financial statements were authorised for issue.

4.1.2.F Items of income, expense, gains or losses

An entity must disclose the following items of income, expense, gains or losses:

- The income, expense, net gains or net losses including changes in fair value recognised on:
 - Financial assets measured at fair value through profit or loss. *[FRS 102.11.48(a)(i)]*.
 - Financial liabilities measured at fair value through profit or loss (with separate disclosure of movements on those which are not held as part of a trading portfolio and are not derivatives). *[FRS 102.11.48(a)(ii)]*.
 - Financial assets measured at amortised cost. *[FRS 102.11.48(a)(iii)]*.
 - Financial liabilities measured at amortised cost. *[FRS 102.11.48(a)(iv)]*.
- And
- Where an entity has elected to apply the classification and measurement requirements of IFRS 9 financial instruments measured at fair value through other comprehensive income. *[FRS 102.11.48(a)(v)]*.
 - Total interest income and total interest expense (calculated using the effective interest method) for financial assets or financial liabilities that are not measured at fair value through profit or loss. *[FRS 102.11.48(b)]*.
 - The amount of any impairment loss for each class of financial asset. A class of financial asset is a grouping that is appropriate to the nature of the information disclosed and that takes into account the characteristics of the financial assets.

When an entity has made the accounting policy choice to apply the recognition and measurement provisions of IFRS 9 (see Chapter 13 at 3), the groupings must be based on whether the amount is equal to 12-month expected credit risk losses, equal to the lifetime expected credit losses or financial assets that are purchased or originated credit-impaired. *[FRS 102.11.48(c)]*.

4.1.2.G Quantitative and qualitative information about amounts arising from expected credit losses

When an entity has made the accounting policy choice to apply the recognition and measurement provisions of IFRS 9 (see Chapter 13 at 3), the entity must:

- Explain the inputs, assumptions and estimation techniques used in determining the expected credit losses. Therefore, the entity must disclose: *[FRS 102.11.48ZA]*
 - The basis of inputs and assumptions and the estimation techniques used in the measurement of the expected credit losses.
 - How forward-looking information has been incorporated into the determination of expected credit losses, including the use of macroeconomic information.
- And
- Changes in the estimation techniques or significant assumptions made during the reporting period and the reasons for those changes.
 - Provide a reconciliation from the opening balance to the closing balance of the allowance, in a table, to explain the changes in the allowance for expected credit losses. Section 34 paragraph 21A(b) sets out a similar requirement for financial institutions. *[FRS 102.11.48ZB, FRS 102.34.21A(b)]*.

4.1.2.H Financial instruments at fair value through profit or loss

An entity in the UK, including an entity that is not a company, must provide the disclosures below only for financial instruments that are measured at fair value in accordance with paragraph 36(4) of Schedule 1 to The Regulations (see Chapter 13 at 4.4.1) i.e., those financial instruments that can be accounted for at fair value under UK-adopted IAS. However, this does not include financial liabilities held as part of a trading portfolio nor financial liabilities that are derivatives. *[FRS 102.11.48A]*.

The disclosure requirements referred to above are as follows: *[FRS 102.11.48A]*

- For a financial liability designated at fair value through profit or loss, the amount of change, during the period and cumulatively, in the fair value of the financial instrument that is attributable to changes in the credit risk of that instrument, determined either:
 - As the amount of change in its fair value that is not attributable to changes in market conditions that give rise to market risk.
 - Or
 - Using an alternative method the entity believes more faithfully represents the amount of change in its fair value that is attributable to changes in the credit risk of the instrument.
- The method used to establish the amount of change attributable to changes in own credit risk, or, if the change cannot be measured reliably or is not material, that fact.
- The difference between the financial liability's carrying amount and the amount the entity would be contractually required to pay at maturity to the holder of the obligation.
- If an instrument contains both a liability and an equity feature, and the instrument has multiple features that substantially modify the cash flows and the values of those features are interdependent (such as a callable convertible debt instrument), the existence of those features.
- If there is a difference between the fair value of a financial instrument at initial recognition and the amount determined at that date using a valuation technique, the aggregate difference yet to be recognised in profit or loss at the beginning and end of the period and a reconciliation of the changes in the balance of this difference.
- Information that enables users of the entity's financial statements to evaluate the nature and extent of relevant risks arising from financial instruments to which the entity is exposed at the end of the reporting period. These risks typically include, but are not limited to, credit risk, liquidity risk and market risk. The disclosure must include both the entity's exposure to each type of risk and how it manages those risks.

Except for the disclosures required for entities in the Republic of Ireland, the purpose of these disclosures above is compliance with the disclosures in UK-adopted IAS when using fair value accounting according to paragraph 36(4) of Schedule 1 to the Regulations. These disclosure requirements will predominantly apply to certain financial liabilities. However, there may be instances where The Regulations require that the disclosures must also be provided in relation to financial assets, for example investments in subsidiaries, associates or jointly controlled entities measured at fair value. *[FRS 102.9.27B, FRS 102.A3.13]*.

4.1.2.I Interest rate benchmark reform

An entity is required to disclose information on: *[FRS 102.11.49]*

- The nature and extent of risks arising from the financial instruments subject to interest rate benchmark reform.
- How the entity manages those risks.
- And
- The entity's progress in completing the transition from interest rate benchmarks to alternative benchmark rates.

When an entity has applied the practical expedient in paragraph 20C of Section 11, the entity must disclose that fact. Furthermore, the entity must consider whether any further disclosure is necessary, for example judgements and estimates in accordance with paragraphs 6 and 7 of Section 8. *[FRS 102.11.50]*.

4.1.2.J Hedge accounting

When hedge accounting is applied, entities are required to make the following additional disclosures: *[FRS 102.12.26]*

- Entities must disclose the following separately for each type of hedging relationships: *[FRS 102.12.27]*
 - A description of the hedge relationship.
 - A description of the financial instruments designated as hedging instruments and their fair values at the reporting date.
 - A description of the hedged item.

And

 - The nature of the risks being hedged.
- For fair value hedges, the following disclosures must be provided: *[FRS 102.12.28]*
 - The amount of the change in fair value of the hedging instrument recognised in profit or loss for the period.

And

 - The amount of the change in fair value of the hedged item recognised in profit or loss for the period.
- For cash flow hedges, entities are required to disclose:
 - The periods when the cash flows are expected to occur and when they are expected to affect profit or loss. *[FRS 102.12.29(a)]*.
 - A description of any forecast transaction for which hedge accounting had previously been used, but which is no longer expected to occur. *[FRS 102.12.29(b)]*.
 - The amount of the change in fair value of the hedging instrument that was recognised in other comprehensive income during the period. *[FRS 102.12.29(c)]*.
 - The amount, if any, that was reclassified from equity to profit or loss for the period. *[FRS 102.12.29(d)]*.

And

 - The amount, if any, of any hedge ineffectiveness recognised in profit or loss for the period (i.e., any ineffectiveness). *[FRS 102.12.29(e)]*.
- For a hedge of net investment in a foreign operation, entities must disclose separately: *[FRS 102.12.29A]*
 - The amounts recognised in other comprehensive income (i.e., fair value changes in the hedging instrument that were effective hedges).

And

 - The amounts recognised in profit or loss (as ineffectiveness)
- When an entity has utilised the temporary amendments to the hedge accounting requirements specified in paragraphs 25C to 25F of Section 12, it must disclose the following: *[FRS 102.12.30]*
 - That fact.

And

 - The significant interest rate benchmarks to which the entity's hedging relationships are exposed.

4.1.3 Disclosure exemptions for qualifying entities

Entities that are qualifying entities (but not qualifying entities that are financial institutions) may take advantage of the following disclosure exemptions, provided that disclosures equivalent to those required by Section 11 and 12 are included in the consolidated financial statements in which the qualifying entity is included: *[FRS 102.1.12(c)]*

- The disclosures required by paragraph 42 of Section 11 that enable users of its financial statements to evaluate the significance of financial instruments for its financial position and performance.
- The disclosures required by paragraph 44 of Section 11 if a reliable measure of fair value is no longer available.
- For transferred financial assets that do not qualify for derecognition the disclosures required by paragraph 45 of Section 11.
- The disclosures required by paragraph 47 of Section 11 of defaults and breaches on loans payable.

- The disclosures required by paragraphs 48(a)(iii), 48(a)(iv), 48(b) and 48(c) of Section 11 for the items of income, expense, gains or losses relating to financial instruments.
- For Section 12, which includes the hedge accounting disclosures the entity may take advantage of the following exemptions: paragraph 26 (in relation to those cross-referenced paragraphs from which a disclosure exemption is available), and the hedge accounting disclosures in paragraphs 27, 29(a), 29(b), 29A and 30.

4.1.4 Additional disclosures required for financial institutions under Section 34

For financial institutions (as defined in Chapter 3 at 2.5.1.A) additional disclosures are required to be provided in: *[FRS 102.11.48B, FRS 102.34.17]*

- The individual financial statements of the financial institution.
And
- The consolidated financial statements of a group containing a financial institution when the financial instruments held by the financial institution are material to the group. Where this is the case, the disclosures apply regardless of whether the principal activity of the group is being a financial institution or not. However, the disclosures only need to be given in respect of financial instruments held by entities within the group that are financial institutions.

4.1.4.A Significance of financial instruments for financial position and performance

A disaggregation of the statement of financial position line item by class of financial instrument. A class is a grouping of financial instruments that is appropriate to the nature of the information disclosed and that takes into account the characteristics of those financial instruments. *[FRS 102.34.20]*.

4.1.4.B Impairment

Unless a financial institution has made the accounting policy choice to apply the recognition and measurement provision of IFRS 9 (as set out in Chapter 13 at 3), where a separate allowance account is used to record impairments, a reconciliation of changes in that account during the period for each class of financial asset. *[FRS 102.34.21]*.

When a financial institution has made the accounting policy choice to apply the recognition and measurement provisions of IFRS 9 (as set out in Chapter 13 at 3), it must disclose information that enables users of its financial statements to understand the effect of credit risk on the amount, timing and uncertainty of future cash flows. This must include:

- An explanation of the financial institution's credit risk management practices and how they relate to the recognition and measurement of expected credit losses. This must include, but is not limited to, providing the disclosure as required by Section 11 paragraph 48ZA (see Quantitative and qualitative information about amounts arising from expected credit losses at 4.1.2.G above). *[FRS 102.34.21A(a)]*.
- A reconciliation from the opening balance to the closing balance of the loss allowance, in a table, showing separately the changes during the period for: *[FRS 102.34.21A(b)(i)-(iii)]*
 - The loss allowance measured at an amount equal to 12-month expected credit losses.
 - The loss allowance measured at an amount equal to lifetime expected credit losses (showing separately the amount relating to financial instruments for which credit risk has increased significantly since initial recognition).

And

 - Financial assets that are purchased or originated credit-impaired.
- By credit risk rating grade, the gross carrying amount of financial assets and the exposure to credit risk on loan commitments and financial guarantee contracts (showing separately information for financial instruments for which the loss allowance is measured at an amount equal to 12-month expected credit losses, for which the loss allowance is measured at an amount equal to lifetime expected credit losses, and that are purchased or originated credit-impaired financial assets). *[FRS 102.34.21A(c)]*.

4.1.4.C Fair value

For financial instruments held at fair value in the statement of financial position, for each class of financial instrument, an analysis of the level in the fair value hierarchy into which the fair value measurements are categorised. *[FRS 102.34.22]*.

To simplify the preparation of disclosures about financial instruments for the entities affected, whilst increasing the consistency with disclosures required by UK-adopted IAS, the three levels in the fair value hierarchy required for disclosures are aligned with those in IFRS 13. The measurement categories are: [FRS 102.34.22]

- Level 1: The unadjusted quoted price in an active market for identical assets or liabilities that the entity can access at the measurement date.
- Level 2: Inputs other than quoted prices included within Level 1 that are observable (i.e., developed using market data) for the asset or liability, either directly or indirectly.
- Level 3: Inputs are unobservable (i.e., for which market data is unavailable) for the asset or liability.

The fair value measurement is categorised in its entirety based on the lowest level input that is significant to the fair value measurement in its entirety with Level 3 being the lowest level. [FRS 102.34.22].

4.1.4.D Nature and extent of risks arising from financial instruments

Information that enables users of the financial institution's financial statements to evaluate the nature and extent of credit risk, liquidity risk and market risk arising from financial instruments to which the institution is exposed at the end of the reporting period. [FRS 102.34.23].

For each type of risk arising from financial instruments: [FRS 102.34.24]

- The exposures to risk and how they arise.
 - The institution's objectives, policies and processes for managing the risk and the methods used to measure the risk.
- And
- Any changes from the previous period.

4.1.4.E Credit risk

Disclose by class of financial instrument that is not subject to the impairment requirements of IFRS 9 due to the accounting policy choice (as set out in Chapter 13 at 3): [FRS 102.34.25(a)-(c)]

- The amount that best represents the institution's maximum exposure to credit risk at the end of the reporting period. This disclosure is not required for financial instruments whose carrying amount best represents the maximum exposure to credit risk.
 - A description of collateral held as security and of other credit enhancements, and the extent to which these mitigate credit risk.
- And
- The amount by which any related credit derivatives or similar instruments mitigate that maximum exposure to credit risk.

Unless a financial institution has made the accounting policy choice to apply the recognition and measurement requirements of IFRS 9 (as set out in Chapter 13 at 3), an analysis by class of financial asset of:

- Information about the credit quality of financial assets that are neither past due nor impaired. [FRS 102.34.25(d)].
 - The age of financial assets that are past due as at the end of the reporting period but not impaired. [FRS 102.34.26(a)].
- And
- The financial assets that are individually determined to be impaired as at the end of the reporting period, including the factors the financial institution considered in determining that they are impaired. [FRS 102.34.26(b)].

When financial or non-financial assets are obtained by taking possession of collateral held as security or calling on other credit enhancements (e.g., guarantees), and such assets meet the recognition criteria in other sections of FRS 102, a financial institution must disclose: [FRS 102.34.27]

- The nature and carrying amount of the assets obtained.
- And
- When the assets are not readily convertible into cash, its policies for disposing of such assets or for using them in its operations.

4.1.4.F Liquidity risk

A maturity analysis for financial liabilities that shows the remaining contractual maturities at undiscounted amounts separated between derivative and non-derivative financial liabilities. Lease liabilities must be presented separately within non-derivative financial liabilities. [FRS 102.34.28].

4.1.4.G Market risk

A sensitivity analysis for each type of market risk (e.g., interest rate risk, currency risk, other price risk) the financial institution is exposed to, showing the impact on profit or loss and equity. Details of the methods and assumptions used must be provided. If a sensitivity analysis, such as value-at-risk is prepared, that reflects interdependencies between risk variables (e.g., interest rates and exchange rates) and the financial institution uses such analysis to manage financial risks, it may use that sensitivity analysis instead.

[FRS 102.34.29, FRS 102.34.30].

4.1.4.G Capital

Information that enables users of the financial institution's financial statements to evaluate its objectives, policies and processes for managing capital. The institution must disclose:

- (a) Qualitative information about its objectives, policies and processes for managing capital, including:
 - (i) A description of what it manages as capital.
 - (ii) When the institution is subject to externally imposed capital requirements, the nature of those requirements and how those requirements are incorporated into the management of capital.

And

 - (iii) How it is meeting its objectives for managing capital.
- (b) Summary quantitative data about what the financial institution manages as capital. Some regard certain financial liabilities (e.g., some forms of subordinated debt) as part of capital. Others regard capital as excluding some components of equity (e.g., components arising from cash flow hedges).
 - (c) Any changes in (a) and (b) above from the previous period.
 - (d) Whether during the period the financial institution complied with any externally imposed capital requirements to which it is subject to.
 - (e) When the financial institution has not complied with such externally imposed capital requirements, the consequences of such non-compliance.

A financial institution must base all these disclosures on the information provided internally to key management personnel. [FRS 102.34.31].

A financial institution may manage capital in several ways and be subject to various capital requirements. For example, a conglomerate may include entities that undertake insurance activities and banking activities, furthermore those entities may operate in different jurisdictions. When an aggregate disclosure of capital requirements and how capital is managed would not provide useful information or would distort a financial statement user's understanding of the financial institution's capital resources, the financial institution must disclose separate information for each capital requirement to which the entity is subject.

[FRS 102.34.32].

4.1.4.H Reporting cash flows on a net basis

Where a statement of cash flows is presented, cash flows arising from each of the following activities may be reported on a net basis: [FRS 102.34.33]

- Cash receipts and payments for the acceptance and repayment of deposits with a fixed maturity date.
 - The placement of deposits with and withdrawal of deposits from other financial institutions.
- And
- Cash advances and loans made to customers and the repayment of those advances and loans.

4.1.5 Disclosure requirements under Section 11 that may be influenced by climate-related matters

Disclosure requirements within Section 11 may be influenced by climate-related matters, the key ones that may be impacted are as follows:

- Disclosure of any significant risks affecting an entity in relation to the financial instruments it holds. [FRS 102.11.42]. For instance, if an entity possesses equity investments concentrated in a sector particularly susceptible to climate-related issues, such as oil exploration or coal mining, this could represent a significant risk and necessitate disclosure.
- For all financial instruments measured at fair value:
 - Disclosure of the valuation basis, such as market price or valuation technique: Disclosures for valuation techniques must include the assumptions made. [FRS 102.11.43]. For example, a commodity trader may enter in a forward contract to purchase rare earth metals essential for batteries in electric vehicles, with the objective of generating trading profit. In the absence of futures markets for such metals, the valuation of the instrument would encompass assumptions regarding factors such as expected production, demand, and currency fluctuations. These assumptions must be disclosed by the entity.
 - For financial instruments measured at fair value through profit or loss: Disclosure of the risks typically including, but not limited to, credit risk, market risk, and liquidity risk to which the entity is exposed through those instruments, and how these risks are managed. [FRS 102.11.48A]. For example, if an entity has substantial forward purchase and sale contracts, unmatched in time and volume, for a commodity subject to changes in climate-related legislation, such as coal, it would need to disclose the associated market risk it faces. Similarly, if an entity holds debt with covenants linked to ESG measures, related liquidity risk disclosures would need to be made.

4.1.5.A Green bonds

Green bonds are issued by governments, corporations, and NGOs to fund green projects like renewable energy or energy efficiency improvements. These bonds vary in interest rates, terms, and security, catering to different risk appetites. There is no distinct accounting guidance for green bonds, so issuers and holders must follow Sections 11 and 12 of FRS 102 as they would for other bonds. Additionally, climate-related financial arrangements also need to be assessed under Sections 11 and 12 or other relevant sections of FRS 102.

4.1.6 Disclosures applicable to all entities reporting under UK company law

The Regulations require various disclosures in respect of financial instruments. The Regulations include the following categories for Schedule 1 to 3: Schedule 1 - Companies Act Individual accounts: Companies which are not banking or Insurance companies (1 Sch), Schedule 2 - Banking companies: Companies Act Individual accounts (2 Sch) and Schedule 3 - Insurance Companies: Companies Act Individual Accounts (3 Sch).

Entities reporting under such regulations, including qualifying entities, will be required to disclose the following in addition to those discussed at 4.1.2 to 4.1.4 above.

4.1.6.A Investments

- The amount of fixed asset or current asset investments ascribable to listed investments. [1 Sch 54(1), 3 Sch 72]
- The aggregate market value of listed investments where this is different from the amount recorded in the financial statements (and both market value and stock exchange value if market value is higher). [1 Sch 54(2)(a), 1 Sch 54(2)(b)].

4.1.6.B Information about fair value of assets and liabilities

The following must be disclosed where financial instruments are recorded at fair value:

- (a) Significant assumptions underlying any valuation models and techniques used where the fair value has been determined using generally accepted valuation techniques and models. [1 Sch 55(2)(a), 2 Sch 66(2)(a), 3 Sch 73(2)(a)].
- (b) The purchase price, the items affected and the basis of valuation (insurers only). [3 Sch 73(2)(b)].
- (c) The fair value of each category of financial instrument and the changes in value reported in profit and loss or credited/debited to the fair value reserve. [1 Sch 55(2)(b), 2 Sch 66(2)(b), 3 Sch 73(2)(c)].

- (d) For each class of derivatives, the extent and nature of the instruments including significant terms and conditions that may affect the amount, timing and uncertainty of future cash flows. [1 Sch 55(2)(c), 2 Sch 66(2)(c), 3 Sch 73(2)(c and d)].
- (e) Where any amount is transferred to or from the fair value reserve, there must be stated in tabular form, the amount of the reserve at the beginning and end of the reporting period, the amount transferred to/from the reserve in the year and the source and application of the amounts so transferred. [1 Sch 55(3), 2 Sch 66(3), 3 Sch 73(3)].

How we see it

We believe the disclosure requirements included in (a) and (c) above will in most cases be satisfied by disclosure requirements in FRS 102 discussed at 4.1.2.B, 4.1.2.F above.

In addition, entities must disclose:

- The fair values of any derivatives not included at fair value together with the extent and nature of the derivatives. [1 Sch 56, 2 Sch 67, 3 Sch 74]. This disclosure requirement would apply, for example, in the case of a derivative where the underlying investment is an equity instrument for which fair value cannot be reliably measured.
- The fair value of instruments that could be measured at fair value but are measured at a higher amount (i.e., amortised cost), the amount at which these assets are included in the company's accounts and reasons for not making a provision for diminution in value, together with the evidence that provides a basis for recoverability of the amount in the financial statements. [1 Sch 57, 2 Sch 68, 3 Sch 75].

4.1.6.C Fixed assets

For each item within fixed assets: [1 Sch 51(1), 2 Sch 62(1), 3 Sch 69(1)]

- The balance at the beginning and end of the year.
- The effect of any revision of the amount in respect of any assets made during that year on any basis.
- Acquisitions during that year.
- Disposals during that year.
- Any transfers of fixed assets in and out of that item of the balance sheet.

In respect of each asset above, the following must also be disclosed. [1 Sch 51(3), 2 Sch 62(3), 3 Sch 69(3)].

- The cumulative amount of provisions for depreciation or reduction in asset value included under that item as of at the beginning and end of the year.
- The amount of provisions for depreciation made during the financial year.
- The amount of adjustments made to these provisions during the year due to the disposal of assets.
And
- The amount of any other adjustments made to these provisions during the year.

4.1.6.D Details of indebtedness

For the aggregate of all items shown under 'creditors' in the company's balance sheet, the aggregate of the following amounts:

- (a) The amount of any debts which fall due after five years from the date of the balance sheet which are payable other than by instalments. [1 Sch 61(1)(a), 3 Sch 79(1)(a)].
And
- (b) The amount of any debts which are payable in instalments, the amount of any instalments which fall due for payment after the end of five years. [1 Sch 61(1)(b), 3 Sch 79(1)(b)].

For each debt falling into (a) and (b) above, the terms of payment or repayment and the rate of any interest payable on the debt. If the number of debts is such that, in the opinion of the directors, compliance with this requirement would result in excessive length, it is sufficient to provide a general indication of the terms of payment or repayment and the rates of any interest payable on those debts. [1 Sch 61(2)(3), 3 Sch 79(2)(3)].

Furthermore, for each item listed under 'creditors' in the company's balance sheet, the following must be disclosed: [1 Sch 61(4), 3 Sch 79(4)]

- (c) The total amount of debts included under that item for which the company has provided any security.
And
- (d) A description of the nature and form of the securities provided.

It must be noted that the references above to items listed under 'creditors' in the company's balance sheet include references to amounts due to creditors within one year and after more than one year, as distinguished in the balance sheet. In the case of (a) and (b) above it relates to items listed under the latter category, and in the case of (c) and (d) above it relates to items listed under either category [1 Sch 61(5), 3 Sch 79(5)].

4.1.6.F Guarantees and other financial commitments

The following disclosures are required:

- (a) Details must be provided of any charges on the company's assets to secure the liabilities of any other person, including the amount secured. [1 Sch 63(1), 3 Sch 81(1)].
- (b) Details and the total amount of any financial commitments, guarantees, and contingencies that are not included in the balance sheet must be disclosed. [1 Sch 63(2), 2 Sch 77(1), 3 Sch 81(2)].
- (c) A description of the nature and form of any valuable security provided by the company in relation to commitments, guarantees, and contingencies within (b) above must be given. [1 Sch 63(3), 2 Sch 77(2), 3 Sch 81(3)].
- (d) The total amount of any commitments related to pensions, as mentioned in (xiv) above, must be disclosed separately. [1 Sch 63(4), 2 Sch 77(3), 3 Sch 81(4)].
- (e) Details must be provided of pension commitments that are included in the balance sheet. [1 Sch 63(5), 2 Sch 77(4), 3 Sch 81(5)].
- (f) If any commitment within (d) or (e) pertains wholly or partly to pensions payable to past directors of the company, separate details of that commitment must be provided. [1 Sch 63(6), 2 Sch 77(5), 3 Sch 81(6)].
- (g) The total amount of any commitments, guarantees, and contingencies mentioned in (b) above that are undertaken on behalf of or for the benefit of: [1 Sch 63(7), 2 Sch 77(6), 3 Sch 81(7)]
 - (i) Any parent undertaking or fellow subsidiary undertaking of the company.
 - (ii) Any subsidiary undertaking of the company.

Or

 - (iii) Any undertaking in which the company has a participating interest.

Must be separately stated and those within each of paragraphs (i), (ii) and (iii) above must also be stated separately from those within any other of those paragraphs.
- (h) The nature and amount of any contingent liabilities and commitments included in the Memorandum items 1 and 2 to the Regulations which are material in relation to the company's activities must be disclosed. [2 Sch 77(7)].

4.1.6.G Miscellaneous matters

If any outstanding loans made under the authority of section 682(2)(b), (c), or (d) of the Act (various cases of financial assistance by a company for the purchase of its own shares) are included under any item shown in the balance sheet of the company, the aggregate amount of those loans must be disclosed for each relevant item. [1 Sch 64(2), 2 Sch 84(2), 3 Sch 82(2)].

4.1.6.H Fixed cumulative dividends

If the company has fixed cumulative dividends that are in arrears the following must be disclosed: [1 Sch 62, 2 Sch 75, 3 Sch 80]

- The amounts of the arrears.
- And
- Per class of dividend, the period for which they are in arrears.

4.1.6.I Share capital and debentures

The company must disclose following information regarding its share capital:

- If shares of more than one class have been allotted, the number and total nominal value of shares allotted for each class. [1 Sch 47(1)(a), 2 Sch 58(1), 3 Sch 65(1)].
- And
- If shares are held as treasury shares, the number and total nominal value of the treasury shares. Additionally, if shares of more than one class have been allotted, the number and total nominal value of the shares of each class held as treasury shares. [1 Sch 47(1)(b)].

For any portion of the allotted share capital that consists of redeemable shares, the following details must be provided: [1 Sch 47(2), 2 Sch 58(2), 3 Sch 65(2)]

- The earliest and latest dates on which the company has the authority to redeem those shares
- Whether the shares are required to be redeemed under any circumstances or if they are liable to be redeemed at the option of the company or the shareholder.

And

- Whether any premium is payable upon redemption, and if so, the amount of the premium.

For shares that have been allotted during the year, the following details must be provided: [1 Sch 48, 2 Sch 59, 3 Sch 66]

- The class of shares allotted.

And

- For each class of share, the number allotted, their aggregate nominal value and the consideration received by the company for the allotment.

For any contingent right to the allotment of shares in the company, the following must be disclosed:

[1 Sch 49(1), 2 Sch 60(1), 3 Sch 67(1)]

- The number, description and amount of the shares in relation to which the right is exercisable.
- The period during which it is exercisable.

And

- The price to be paid for the shares allotted.

Contingent right to the allotment of shares above refers to any option to subscribe for shares, as well as any other entitlement that gives a person the right to be allotted shares, including through the conversion of other types of securities or by other means. [1 Sch 49(2), 2 Sch 60(2), 3 Sch 67(2)].

If any debentures were issued during the year, the following information must be disclosed: [1 Sch 50(1), 2 Sch 61(1), 3 Sch 68(1)]

- The classes of debentures issued

And

- The amount issued and the consideration received in respect of each class of debenture

It must be noted that when a company's debentures are held by a nominee or trustee for the company, the nominal amount of the debentures and the amount at which they are stated at in the company's accounting records must be disclosed. [1 Sch 50(2), 2 Sch 61(2), 3 Sch 68(2)].

4.1.6.J Reserves and Provisions

The following details must be provided regarding the total amount of reserves or provisions included under the same item, presented in tabular form: [1 Sch 59(2), 2 Sch 70(2), 3 Sch 77(2)]

- The amount of reserves or provisions at the both the beginning and end of the period.
- Any amounts transferred to or from the reserve or provision during the period.

And

- The source and application of any amounts transferred.

This paragraph applies to any case where an amount is transferred: to or from any reserves; to any provision of liabilities or from any provision for liabilities for a purpose other than that for which the provision was originally established. [1 Sch 59(1), 2 Sch 70(1), 3 Sch 77(1)].

Details must be provided for each material provision listed under 'other provisions' in the company's balance sheet. [1 Sch 59(3), 2 Sch 70(3), 3 Sch 77(3)].

4.1.6.K Separate statement of certain items of income and expenditure

For bank loans, overdrafts and other type of loans made to the company (apart from loans from group undertakings) the amount of interest and similar charges must be disclosed. This applies regardless of whether these are secured by debentures or not. [1 Sch 66, 3 Sch 83].

4.1.6.L Reserves and dividends

The following must be disclosed: [1 Sch 43, 2 Sch 56, 3 Sch 64]

- (a) Any amounts that have been, or are proposed to be, allocated to or withdrawn from reserves.
 - (b) The total amount of dividends paid during the financial year, excluding those for which a liability existed at the previous balance sheet date.
 - (c) The total amount of dividends the company is liable to pay as of the balance sheet date.
- And
- (d) The total amount of dividends proposed before the accounts are approved, unless already disclosed under sub-paragraphs (b) or (c).

For the statutory disclosures in Small Companies Regulations and Small LLP Regulations see Chapter 5 at 5.3.2.C.

4.1.7 Disclosures applicable to Banking Companies reporting under UK company law

In addition to the Schedule 2 items noted at 4.1.6 above, Banking Companies will have to disclose the following as required by the Regulations:

Maturity analysis

- (i) A company must separately disclose the aggregate amount of loans and advances and liabilities included within each of the asset items: Loans and advances to banks - Other loans and advances and Loans and advances to customer. The same disclosure is required for each of the liability items: Deposits by banks - With agreed maturity dates or periods of notice, Customer accounts - With agreed maturity dates or periods of notice and Debt securities in issue - Others.

This disclosure is broken down into the following categories: [2 Sch 72(1)]

- (a) Those repayable in not more than three months
 - (b) Those repayable in more than three months but not more than one year
 - (c) Those repayable in more than one year but not more than five years
 - (d) Those repayable in more than five years
- from the balance sheet date.

For the purposes of the above disclosure, where a loan or advance or liability is repayable by instalments, each such instalment is to be treated as a separate loan or advance or liability. [2 Sch 72(3)].

- (ii) A banking company must also disclose the aggregate amounts of all loans and advances falling within the loans and advances to customers assets item which are repayable on demand or are repayable upon short notice for an indeterminate period. [2 Sch 72(2)].

Debt and other fixed-income securities

- (iii) Banking companies must disclose the amount of debt and fixed-income securities included within the debt securities (and other fixed-income securities) assets item and the bonds and medium term notes liabilities item that (in each case) will become due within one year of the balance sheet date. [2 Sch 73].

Subordinated liabilities

- (iv) In relation to any borrowing included within the subordinated liabilities item that exceeds 10% of the total for that item, the following must be disclosed: [2 Sch 74(1)]

- (a) Its amount
- (b) The currency in which it is denominated
- (c) The rate of interest and the maturity date (or the fact that it is perpetual)
- (d) The circumstances in which early repayment may be demanded
- (e) The terms of the subordination

And

- (f) The existence of any provisions whereby it may be converted into capital or some other form of liability and the terms of any such provisions
- (v) The general terms of any other borrowings included within the subordinated liabilities item must also be stated. [2 Sch 74(2)].

Details of assets charged

- (vi) For each liability and memorandum item of the balance sheet format, the following must be disclosed: [2 Sch 76(1)]
- (a) The total amount of any company assets that have been charged/pledged to secure any liability or potential liability under that item.
 - (b) The total amount of the liabilities or potential liabilities that are so secured.
- And
- (c) A description of the nature of the security provided.
- (vii) Details must also be provided of any other charges on the company's assets to secure the liabilities of any other person, including, where possible, the amount secured. [2 Sch 76(2)].

Transferable securities

- (viii) For each of the asset items: Debt securities (and other fixed-income securities); Equity shares (and other variable-yield securities); Participating interests and shares in group undertakings in the balance sheet format, the amount of transferable securities included under those items that are listed and those that are unlisted must be disclosed separately. [2 Sch 79(1)].
- (ix) For each amount shown for listed securities under (viii) above, the aggregate market value of those securities must also be disclosed if it differs from the amount shown. [2 Sch 79(2)].
- (x) For each of the asset items: Debt securities (and other fixed-income securities) and equity shares (and other variable-yield securities), the amount of transferable securities held as financial fixed assets and those not held as such must be disclosed, along with the criterion used by the directors to distinguish between those held as financial fixed assets. [2 Sch 79(3)].

Unmatured forward transactions

- (xi) For unmaturing forward transactions outstanding at the balance sheet date, the following must be disclosed: [2 Sch 83(1)]
- (a) The categories of such transactions, according to an appropriate system of classification.
 - (b) For each such category, disclose whether they have been made primarily for hedging against fluctuations in interest rates, exchange rates, and market prices, or for dealing purposes.
- (xii) Transactions under (xi) above must encompass all those for which income or expenditure is to be included in:
- (a) format 1, item 6 or format 2, items B4 or A3 i.e., dealing profits/losses
 - (b) format 1, items 1 or 2, or format 2, items B1 or A1 (i.e., interest receivable/interest payable), by virtue of notes (1)(b) and (2)(b) to the profit and loss account formats, which relates to: charges arising from covered forward contracts, allocated over the contract's actual duration and akin to interest

5 Summary of GAAP differences

The disclosure requirements for FRS 102 are outlined in Sections 11 and 12. Additional disclosures are set out in Section 34 for entities that are considered a financial institution. The disclosures under IAS 32, IFRS 7 and IFRS 13 are similar but more extensive than those required by FRS 102, as such GAAP differences exist in the level of disclosure required. The disclosures required under UK Company law are not required under IFRS.

Appendix A - Defined terms

Extract from FRS 102 Appendix 1 Glossary

Glossary

Act	The Companies Act 2006
active market	A market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis.
amortised cost (of a financial asset or financial liability)	The amount at which the financial asset or financial liability is measured at initial recognition minus principal repayments, plus or minus the cumulative amortisation using the effective interest method of any difference between that initial amount and the maturity amount, and minus any reduction (directly or through the use of an allowance account) for impairment or uncollectability.
compound financial instrument	A financial instrument that, from the issuer's perspective, contains both a liability and an equity element.
derecognition	The removal of all or part of a recognised asset or liability from an entity's statement of financial position.
derivative	A financial instrument or other contract with all three of the following characteristics: (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable (sometimes called the 'underlying'), provided in the case of a non-financial variable that the variable is not specific to a party to the contract; (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors; and (c) it is settled at a future date.
effective interest method	A method of calculating the amortised cost of a financial asset or a financial liability (or a group of financial assets or financial liabilities) and of allocating the interest income or interest expense over the relevant period.
effective interest rate	The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial instrument or, when appropriate, a shorter period to the carrying amount of the financial asset or financial liability.
equity	The residual interest in the assets of the entity after deducting all its liabilities.
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in Section 2A Fair Value Measurement shall be used in determining fair value.

financial asset

Any asset that is:

- (a) cash;
- (b) an equity instrument of another entity;
- (c) a contractual right:
 - (i) to receive cash or another financial asset from another entity, or
 - (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or
- (d) a contract that will or may be settled in the entity's own equity instruments and is:
 - (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or
 - (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the entity's own equity instruments.

financial institution

Any of the following:

- (a) a bank which is:
 - (i) a firm with a Part 4A permission which includes accepting deposits and:
 - (a) which is a credit institution; or
 - (b) whose Part 4A permission includes a requirement that it complies with the rules in the General Prudential sourcebook and the Prudential sourcebook for Banks, Building Societies and Investment Firms relating to banks, but which is not a building society, a friendly society or a credit union;
 - (ii) an EEA bank which is a full credit institution;
- (b) a building society which is defined in section 119(1) of the Building Societies Act 1986 as a building society incorporated (or deemed to be incorporated) under that act;
- (c) a credit union, being a body corporate registered under the Co-operative and Community Benefit Societies Act 2014 as a credit union in accordance with the Credit Unions Act 1979, which is an authorised person;
- (d) a custodian bank or broker-dealer;
- (e) an entity that undertakes the business of effecting or carrying out insurance contracts, including general and life assurance entities;
- (f) an incorporated friendly society incorporated under the Friendly Societies Act 1992 or a registered under section 7(1)(a) of the Friendly Societies Act 1974 or any enactment which it replaced, including any registered branches;
- (g) an investment trust, Irish investment company, venture capital trust, mutual fund, exchange traded fund, unit trust, open-ended investment company (OEIC); or
- (h) [Deleted]

	(i) any other entity whose principal activity is similar to those listed above but is not specifically included in that list. A parent entity whose sole activity is to hold investments in other group entities is not a financial institution.
financial instrument	A contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity.
financial liability	Any liability that is: (a) a contractual obligation: (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity, or (b) a contract that will or may be settled in the entity's own equity instruments and is: (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the entity's own equity instruments.
firm commitment	Binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates.
forecast transaction	Uncommitted but anticipated future transaction.
hedging gain or loss	The change in fair value of a hedged item that is attributable to the hedged risk.
highly probable	Significantly more likely than probable.
liquidity risk	The risk that an entity will encounter difficulty in meeting obligations associated with financial liabilities that are settled by delivering cash or another financial asset.
market risk	The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices. Market risk comprises three types of risk: currency risk, interest rate risk and other price risk. Interest rate risk - the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market interest rates. Currency risk - the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in foreign exchange rates. Other price risk - the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices (other than those arising from interest rate risk or currency risk), whether those changes are caused by factors specific to the financial instrument or its issuer, or factors affecting all similar financial instruments traded in the market.
non-controlling interest	The equity in a subsidiary not attributable, directly or indirectly, to a parent.
probable	More likely than not.

publicly traded (debt or equity instruments)	Traded, or in process of being issued for trading, in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets).
transaction costs (financial instruments)	Incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or financial liability, or the issue or reacquisition of an entity's own equity instrument. An incremental cost is one that would not have been incurred if the entity had not acquired, issued or disposed of the financial asset or financial liability, or had not issued or reacquired its own equity instrument.
treasury shares	An entity's own equity instruments, held by that entity or other members of the consolidated group.
UK-adopted international accounting standards	IAS that have been adopted for use within the UK in accordance with the International Accounting Standards and European Public Limited-Liability Company (Amendment etc.) (EU Exit) Regulations 2019 (SI 2019/685).

Overview

Section 13 *Inventories* of FRS 102 addresses the measurement and disclosure requirements for inventories. Inventories are assets that are held for sale in the ordinary course of business, in the process of production for sale or in the form of materials and supplies that will be consumed in the production process or as part of the rendering of services. This chapter and section of the standard applies to all inventories except for financial instruments and biological assets related to agricultural activity and agricultural produce at the point of harvest.

There have been minor changes arising from the March 2024 amendments to the Standard being:

- The removal of work in progress arising under construction contracts from the scope exceptions of the Section as a result of changes to Section 23 *Revenue*.
- A new paragraph confirming that this Section applies to the presentation and disclosure of refund assets held in inventory for expected product returns.
- The inclusion of right-of-use assets used in the production process within the costs of conversion of inventories, as a result of the changes in Section 20 *Leases*.
- Removal of 'estimated' in relation to costs to sell when considering the initial measurement of agricultural produce at the point of harvest.

The standard's basic rule is that inventories are measured at the lower of cost and net realisable value, except for inventories held for distribution at no or nominal consideration. The use of measurement techniques such as the cost method, the retail method or most recent purchase price is permitted if the result approximates to cost.

What you need to know

- In many industries, inventories are one of the more significant classes of assets and their accounting treatment may have a material impact on the statement of financial position and operating results.
- Significant judgements or assumptions may be required in classifying assets, determining costs to be included in inventory and determining the relevant net realisable value that meets the objectives of the standard.

1 Introduction

Section 13 of FRS 102 addresses the measurement and disclosure requirements for inventories.

The term 'inventories' includes assets held for sale in the ordinary course of business; in the process of production for such sale; or in the form of materials or supplies to be consumed in the production process or in the rendering of services. Inventories can include all types of goods purchased and held for resale and may also include tangible and intangible assets held by an entity for sale in the ordinary course of business. Biological assets related to agricultural activity and agricultural produce at the point of harvest are however dealt with in Section 34 *Specialised Activities* (see Chapter 36). This chapter only deals with inventories within the scope of Section 13.

Costs of inventories comprise expenditure which has been incurred in bringing the inventory to its present location and condition. All costs incurred in respect of inventories are charged to profit and loss, except for those which relate to those unconsumed inventories which are expected to be of future benefit to the entity. These are carried forward as an asset, until the entity transfers control to a third party, at which point revenue is recognised in accordance with Section 23 *Revenue* (see Chapter 25).

Amendments were made in the March 2024 Periodic Review to reflect the changes made for Revenue and Leases.

The principles of Section 13 are broadly consistent with IFRS.

2 Comparison between Section 13 and IFRS

The accounting for inventories under IFRS is addressed by IAS 2 *Inventories*. Section 13 and IAS 2 both use the principle that the primary basis of accounting for inventories is cost unless the amount that the inventories are expected to realise upon sale less costs to complete and sell is lower than cost. Where this is the case, the inventories are written down to that lower amount.

Generally, under Section 13 and IAS 2, the cost of inventories comprises all costs of purchase and costs of conversion based on normal levels of activity and other costs incurred in bringing inventories to their present location and condition.

Both accounting frameworks allow the use of measurement techniques, such as standard costing, provided the measurement technique gives an approximate to cost.

There are, however, some areas of potential difference between the frameworks in accounting for inventories. These differences mainly arise where more specific requirements are contained within IAS 2 than are provided under Section 13. These areas are summarised at 4 below.

3 Requirements of Section 13 for inventories

3.1 Scope

Inventories are assets: *[FRS 102 Appendix I]*

- Held for sale in the ordinary course of business.
- In the process of production for such sale.

Or

- In the form of materials or supplies to be consumed in the production process or in the rendering of services.

Inventories can include all types of goods purchased and held for resale including, for example, merchandise purchased by a retailer. The term also encompasses finished goods produced, or work in progress being produced by the entity, and includes materials and supplies awaiting use in the production process. If the entity is a service provider, its inventories may be intangible (e.g., the costs of the service for which the entity has not yet recognised the related revenue).

Section 13 sets out its scope as follows: *[FRS 102.13.2, FRS 102.13.2A, FRS 102.13.3]*

Extract from Section 13

- 13.2** This section applies to all inventories, except:
- (a) [deleted]
 - (b) financial instruments (see Section 11 Basic Financial Instruments and Section 12 Other Financial Instruments issues); and
 - (c) biological assets related to agricultural activity and agricultural produce at the point of harvest (see IAS 41 Agriculture).
- 13.2A** This section applies to the presentation and disclosure of refund assets held in inventory representing expected product returns. An entity shall recognise and measure refund assets in accordance with paragraphs 23.51 to 23.57.
- 13.3** Other than the disclosure requirements in paragraph 13.22, this section does not apply to the measurement of inventories at fair value less costs to sell through profit or loss at each reporting date. Inventories shall not be measured at fair value less costs to sell unless it is a more relevant measure of the entity's performance because the entity operates in an active market where sale can be achieved at published prices, and inventory is a store of readily realisable value.

In addition, the measurement provisions of Section 13 do not apply to inventories measured at fair value through profit and loss at each reporting date. *[FRS 102.13.3]*. Although these inventories are scoped out of the measurement requirements of Section 13, the disclosure requirements of Section 13 continue to apply.

Section 13 states that inventories must not be measured at fair value unless it is a more relevant measure of the entity's performance (i.e., more relevant than cost and estimated selling price less costs to complete and sell) because the entity operates in an active market where sale can be achieved at published prices, and inventory is a store of readily realisable value. *[FRS 102.13.3]*. 'Relevance' will be judged by the criteria in Section 2 and is discussed in Chapter 4 at 3.3.1.A. Measuring inventories at fair value less costs to sell is permitted by company law. *[1 Sch 39, 1 Sch 39 (LLP)]*. However, the Regulations (and LLP Regulations) do not specify how changes in the fair value of stocks are recognised under the fair value accounting rules.

Section 13 requires that fair value movements are recognised in profit or loss on inventories measured at fair value less costs to sell. Although the Regulations require that that only profits realised at the balance sheet date are to be included in the profit and loss account, *[1 Sch 13, 1 Sch 13 (LLP)]*, the measurement of inventory at fair value less costs to sell through profit or loss is permitted only where the entity operates in an active market, where sale can be achieved at published prices, and inventory is a store of readily realisable value, *[FRS 102.13.3]*, and therefore would not require the use of a true and fair override.

The criteria for the use of measurement at fair value in Section 2A of FRS 102 described above is different from that contained in IAS 2 which is limited to certain types of inventories (e.g., agricultural produce and inventories held by commodity broker-traders). *[IAS 2.3]*. In addition, IAS 2 does not contain a requirement that an entity operates in an active market or that inventory is a store of readily realisable value for fair value measurement to be applied.

3.1.1 Scope and recognition issues

For entities operating in some industries, it may not always be clear whether certain assets fall in scope of Section 13 or are covered by another section of FRS 102. Some of the practical application issues are covered further in this chapter. Other practical application issues such as classification of broadcast rights, emission rights and crypto currencies are discussed further in the EY Publication, International GAAP®.

3.1.1.A Spare parts

Many entities carry spare parts for items of property, plant and equipment. Section 17 *Property, Plant and Equipment* requires that spare parts, stand-by equipment and servicing equipment are recognised as property, plant and equipment if they meet the definition of property, plant and equipment; [FRS 102.17.5] that is, they are tangible assets that:

- Are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes.

And

- Are expected to be used during more than one period. [FRS 102 Appendix I].

Otherwise, such items are classified as inventory. [FRS 102.17.5].

There are, of course, practical considerations when determining whether major spare parts must be classified as inventory or property, plant and equipment and these considerations are discussed further at 3.3.1.A of Chapter 20.

3.1.1.B Real estate inventory held for short term sale

Many real estate businesses develop and construct residential properties for sale, often consisting of several units. The strategy is to make a profit from the development and construction of the property rather than to make a profit in the long term from general price increases in the property market. The intention is to sell the property units as soon as possible following their construction and is therefore in the ordinary course of the entity's business. When construction is complete it is not uncommon for individual property units to be leased at market rates to earn revenues to partly cover expenses such as interest, management fees and real estate taxes. Large-scale buyers of property, such as insurance companies, are often reluctant to buy unless tenants are *in situ*, as this assures immediate cash flows from the investment.

How we see it

It is our view that if it is in the entity's ordinary course of business (supported by its strategy) to hold property for short-term sale rather than for long-term capital appreciation or rental income, the entire property (including the leased units) must be accounted for and presented as inventory. This will continue to be the case as long as it remains the intention to sell the property in the short term.

Rent received must be included in other income as it does not represent a reduction in the cost of inventory. The entity does not capitalise rental and related income generated by tenants against the cost of the development as this is incidental to the development of the property and not a 'by-product' of the development process.

Investment property, which is accounted for under Section 16 *Investment Property* is defined as "property (land or a building, or part of a building, or both) held by the owner or by the lessee under a finance lease to earn rentals or for capital appreciation or both, rather than for: (a) use in the production or supply of goods or services or for administrative purposes; or (b) for sale in the ordinary course of business". [FRS 102 Appendix I]. Therefore, in the case of large-scale buyers of property outlined above, the property does not meet the definition of investment property. Properties intended for sale in the ordinary course of business - whether leased out or not - are outside the scope of Section 16. However, if property is intended for sale, Section 16 requires it to be transferred from inventory to investment property when there is a change in use. This change can be evidenced by the commencement of an operating lease to another party (see Chapter 19 at 3.4).

The accounting for real estate inventory is discussed in the EY publication, International GAAP®.

3.1.1.C Consignment stock and sale and repurchase agreements

A manufacturer may enter into an arrangement with a distributor where the distributor sells inventory on behalf of the manufacturer. Such consignment arrangements are common in certain industries, such as the automotive industry. Under such arrangements, a manufacturer (consignor) may deliver inventory on a consignment basis to a distributor or dealer (consignee). The consignor retains the legal title to the inventory and consignee acts as a selling agent. Under Section 23 *Revenue* the manufacturer will not recognise revenue for the stock delivered to the consignee because control has not yet transferred (see Chapter 25 at 8.2) and would continue to account for the consignment inventory until control has passed. [FRS 102.23.78].

Similarly, an entity may enter into sale and repurchase agreements with a customer where the entity agrees to repurchase inventory under particular circumstances. For example, an entity may agree to repurchase any inventory that the customer has not sold to a third party after six months.

In a consignment arrangement where the distributor or dealer has physical possession of inventory that an entity controls, inventory must not be derecognised and revenue must not be recognised by the consignor upon delivery of the product held on consignment. [FRS 102.23.86(b)]. Indicators of a consignment arrangement can include:

- Until a specified event occurs, such as the sale of a product to the customer of the distributor, or a specified period expires, the product is controlled by the entity.
 - There is a right to require the return of product or transfer to product to a third party (such as a distributor).
- Or
- The distributor does not have an unconditional obligation to pay for the product (although the payment of a deposit may be required). [FRS 102.23.87].

When an arrangement is accounted for as a financing arrangement, the seller will continue to recognise the inventory on its balance sheet and will also recognise a financial liability for the consideration received. If Section 23 requires the arrangement to be accounted for as a lease, the arrangement must be accounted for in accordance with Section 20. In this case, if the seller is considered to be acting as the lessor in an operating lease, the seller will continue to recognise the inventory on balance sheet. For arrangements that are considered to be a sale with a right of return, inventory will be derecognised and the seller will instead recognise a right of return asset. Sales with a right of return are considered further in at 3.1.1.D below.

The entity will also have to consider appropriate disclosure for material amounts of inventories that are held on consignment or sale and return at a third party's premises.

Consignment stock may also be found in situations other than distribution agreements, for example, when an entity (consignor) outsources part of its production process and transfers the legal title of inventories to a third party (consignee) in a sale transaction to enable that consignee to perform an outsourced task, with the inventories subsequently repurchased by the consignor. This may arise, for example, in the pharmaceutical industry, where a pharmaceutical entity may legally sell large quantities of an active drug principle in bulk to enable repackaging into smaller quantities which are subsequently repurchased by the consignor. Although the transaction takes the legal form of a sale, the seller (consignor) does not transfer control of the goods and therefore, must not derecognise the inventories. Section 23 provides specific application guidance for a promise to deliver goods on a consignment basis to other parties (see Chapter 25 at 8.2) and principal versus agent considerations (see Chapter 25 at 5.4).

3.1.1.D Sales with a right of return

An entity may provide its customers with a right to return goods that it has sold to them. The right may be contractual, or an implicit right that exists due to the entity's customary business practice, or a combination of both. Offering a right of return in a sales agreement obliges the selling entity to stand ready to accept any returned product. Under Section 23, the potential for customer returns needs to be considered when an entity estimates the transaction price because potential returns are a component of variable consideration. Section 23 also requires that the selling entity recognise the amount received or receivable that is expected to be returned to the customer as a refund liability and recognise a return asset for its right to recover goods returned by the customer. The carrying value of the return asset is presented separately from inventory. Sales with a right of return are discussed further in Chapter 25 at 5.7 and 8.7.

3.2 Measurement

Inventories in scope of the measurement provisions of Section 13 must be measured at the lower of cost and estimated selling price less costs to complete and sell. [FRS 102.13.4].

3.2.1 What is included in the cost of inventories?

The cost of inventories must include all costs of purchase, costs of conversion and other costs incurred in bringing inventories to their present location and condition. [FRS 102.13.5].

Other costs must be included in the cost of inventories only to the extent that they are incurred in bringing them into their present location and condition. [FRS 102.13.11]. For example, design costs for a special order for a particular customer must be included in inventory.

3.2.2 Costs of purchase of inventories

Section 13 states that: [FRS 102.13.6]

Extract from Section 13

Costs of purchase

- 6 The costs of purchase of inventories comprise the purchase price, import duties and other taxes (other than those subsequently recoverable by the entity from the taxing authorities), and transport, handling and other costs directly attributable to the acquisition of finished goods, materials and services. Trade discounts, rebates and other similar items are deducted in determining the costs of purchase.

There may be instances in which it is not clear whether payments received from suppliers are a discount, rebate or another similar item, nor whether they relate to inventories, another asset or something else. Unlike Section 23, which addresses the supplier's accounting for such payments, the accounting for the customer/purchaser receiving such a payment is not comprehensively addressed in by FRS 102 or IFRS accounting standards. Neither Section 13 of FRS 102 nor IAS 2 provide guidance on accounting for such payments beyond noting that discounts, rebates and other similar items are deducted from the purchase price. In the absence of guidance, judgement might be needed. For further discussion on the considerations for payments received from suppliers refer to our publication *Applying IFRS: Accounting for Payments from Suppliers*.⁹⁴

Neither Section 13 of FRS 102 nor IAS 2 provide guidance on how to estimate trade discounts or rebates if they are variable. Discretionary rebates and rebates contingent on future purchases cannot be recognised because the resulting asset would not meet the recognition criteria in Section 2 of FRS 102. The IFRS IC discussed in November 2004 whether volume rebates should be recognised only when threshold volumes are achieved, or proportionately where achievement is assessed as probable. The IFRS IC tentatively agreed that there was insufficient evidence of diversity in practice and, therefore, decided not to add this issue to its agenda.⁹⁵

How we see it

In our view, if it is probable that conditions to earn a trade discount or rebate will be met, and the amount can be estimated reliably, the discount or rebate must be recognised as a reduction in the cost of purchase. It follows that such trade discounts or rebates are recognised as an asset with a corresponding deduction from the cost of inventory. Estimating the amount of the rebate to be received often requires the use of judgement.

⁹⁴ Available on ey.com/IFRS.

⁹⁵ [IFRIC Update](#), November 2004, available on the IFRS Foundation's website.

Entities sometimes purchase inventories on deferred settlement terms. In some cases, the arrangement contains an unstated financing element, for example, a difference between the purchase price for normal credit terms and the deferred settlement amount. In these cases, the difference is usually recognised as an interest expense over the period of the financing. It is not added to the cost of inventories unless the inventory is a qualifying asset under Section 25 *Borrowing Costs* and the entity adopts a policy of capitalising finance costs. [FRS 102.13.7]. Inventories manufactured over a short period of time are not qualifying assets. Only inventories produced in small quantities over a long time period of time are likely to be qualifying assets under Section 25. Qualifying assets are discussed further in Chapter 27.

3.2.3 Costs of conversion

The cost of conversion of inventories includes costs directly related to the units of production, such as direct labour. It also includes a systematic allocation of the fixed and variable production overheads that are incurred in converting materials into finished goods. Fixed production overheads are those indirect costs of production that remain relatively constant regardless of the volume of production, such as depreciation and maintenance of factory buildings, equipment and right-of use assets used in the production process, and the cost of factory management and administration. Variable production overheads are those indirect costs of production that vary directly, or nearly directly, with the volume of production, such as indirect materials and indirect labour. [FRS 102.13.8]. It must be remembered that the inclusion of overheads in the cost of inventories is not optional.

The allocation of fixed production overheads must be based on the normal capacity of the production facilities. Normal capacity is defined as "the production expected to be achieved on average over a number of periods or seasons under normal circumstances, taking into account the loss of capacity resulting from planned maintenance." While actual capacity may be used if it approximates to normal capacity, increased overheads must not be allocated to production as a result of low production or idle plant. Unallocated overheads must be recognised as an expense in the period in which they are incurred. In periods of abnormally high production, the amount of fixed overhead allocated to each unit of production is decreased, as otherwise inventories would be recorded at an amount in excess of cost. [FRS 102.13.9].

The allocation of variable production overheads must be based on the actual use of the production facilities in the period. [FRS 102.13.9].

The occurrence of a natural disaster, epidemic or war may often result in changes to an entity's operations, for example, by interrupting supply chains, restricting operations or increasing operating costs. If production volumes are lower than normal because of a natural disaster, epidemic or war, the entity must not increase the amount of fixed overhead costs allocated to each unit of production. Rather, any unallocated overheads are recognised as an expense in the period in which they are incurred. Conversely, entities may have abnormally high production for certain products, for example due to panic-buying. In these circumstances, an entity needs to decrease the amount of fixed overhead allocated to each unit of production so that inventories are not measured above cost.

Entities need to assess whether wasted materials, labour, or other production costs are abnormal and, if so, they must be expensed as incurred. Entities may incur wasted materials, for example, to repackage goods that were originally destined for the wholesale market now redirected for retail sale to consumers (see 3.2.4 below).

In computing the costs to be allocated using the overhead recovery rate, costs such as distribution and selling must be excluded, together with the cost of storing raw materials and work in progress, unless it is necessary that storage costs be incurred prior to further processing, which may occasionally be the case (see 3.2.4 below).

How we see it

Although not specifically addressed in Section 13, when the revaluation model in Section 17 is applied, depreciation of property, plant and equipment is based on the revalued amount, less the residual value of the asset. Our view is that the depreciation based on the revalued amounts must be used in determining the costs of conversion for inventory valuation purposes.

Some entities may have an obligation to dismantle, remove and restore a production site at some future date. For example, mining companies may have obligations to decommission mines and rehabilitate the impacted area on closure of the mine. Although provisions for such obligations are not specifically addressed by Section 21 *Provisions and Contingencies*, the recognition criteria within Section 21 may require entities to record a provision for these obligations. If the obligation arises as a result of production of inventory during the period, costs in respect of the obligation incurred during the period (measured in accordance with Section 21) must be included within production overheads to be allocated to the cost of inventories. [FRS 102.13.8A]. The estimated costs to dismantle, remove and restore a site which arise either when an item of property, plant or equipment is acquired or as a consequence of having used the property, plant or equipment for purposes other than to produce inventories during the period must be recognised as part of the cost of that item of property, plant and equipment. [FRS 102.17.10].

Illustration 3-1: Inclusion of costs for obligations within production overheads

An entity operates an offshore oilfield where its licensing agreement requires it to remove the oil rig at the end of production and restore the seabed. 90% of the eventual costs relate to the removal of the oil rig and restoration of damage caused by building it. 10% of the eventual costs arise from the extraction of oil. The 10% of costs that arise through the extraction of oil are recognised as a liability when the oil is extracted. The amount of the additional provision recognised each year as a result of the extraction of oil must be part of the production overheads to be allocated to the cost of inventory. The 90% of costs that relate to the removal of the oil rig and restoration of damage caused by building it would be recognised as part of the cost of the oil rig.

3.2.4 Costs excluded from inventories

Section 13 states the following: [FRS 102.13.13]

Extract from Section 13

- 13** Examples of costs excluded from the cost of inventories and recognised as expenses in the period in which they are incurred are:
- (a) abnormal amounts of wasted materials, labour or other production costs;
 - (b) storage costs, unless those costs are necessary in the production process before a further production stage;
 - (c) administrative overheads that do not contribute to bringing inventories to their present location and condition; and
 - (d) selling costs.

3.2.5 Storage and distribution costs

Storage costs are excluded from the cost of inventories unless they are necessary in the production process. This appears to prohibit including the costs of the warehouse and the overheads of a retail outlet as part of inventory, as neither of these is a prelude to a further production stage.

However, where it is necessary to store raw materials or work in progress prior to a further processing or manufacturing stage (e.g., maturing stocks such as cheese, wine and whiskey), the cost of such storage must be included in production overheads.

Although distribution costs are a cost of bringing an item to its present location, company law prohibits them from being added to the cost of stock. However, the Regulations do not define distribution costs. [1 Sch 27(4)]. The question therefore arises as to whether costs of transporting inventory from one location to another are eligible.

Costs of distribution to the customer are not allowed; they are selling costs and FRS 102 prohibits their inclusion in the carrying value of inventory. [FRS 102.13.13(d)].

How we see it

Distribution costs of inventory whose production process is complete should not normally be included in its carrying value.

However, judgement may need to be applied in identifying which costs are necessarily incurred to bring inventories to their present location.

For example, in the context of large retailers with distribution centres (e.g., supermarkets), the transport and logistics involved are essential to their ability to put goods on sale at a particular location in an appropriate condition. In these circumstances, costs to receive, repackage and transport goods from central or regional warehouses to retail outlets are considered a cost of bringing the asset to the point of sale and hence capitalised in the cost of inventories. [FRS 102.13.5]. Conversely:

- The cost of moving inventories from one retail outlet to another cannot be included in the carrying value of inventory.
- Entities may incur additional costs to store inventories due to lower-than-expected demand. Such costs need to be expensed when incurred as storage costs can only be capitalised when they are necessary to the production process before further processing.
- The cost of storing goods at central warehouses before they are shipped to customers upon receipt of an order (for example, for internet sales) or until they are moved to retail outlets for local storage, display or collection by customers cannot be included in the carrying value of inventory.
- Costs of distribution to the customer are excluded from the cost of inventory as they are not incurred to bring inventories to their point of sale.

3.2.6 General and administrative overheads

FRS 102 specifically prohibits administrative overheads that do not contribute to bringing inventories to their present location and condition from being included in the cost of inventories. [FRS 102.13.13(c)]. Costs and overheads that do contribute must be included in costs of conversion. There is a judgement to be made about such matters, as on a very wide interpretation, any department in an entity could be considered to make a contribution to inventories. For example, the accounts department will normally support the following functions:

- Production - by paying direct and indirect production wages and salaries, by controlling purchases and related payments, and by preparing periodic financial statements for the production units.
 - Marketing and distribution - by analysing sales and by controlling the sales ledger.
- And
- General administration - by preparing management accounts and annual financial statements and budgets, by controlling cash resources and by planning investments.

Only those costs of the accounts department that can be reasonably allocated to the production function can be included in the cost of conversion. Part of the management and overhead costs of a large retailer's logistical department may be included in cost if it relates to bringing the inventory to its present location and condition. These types of costs are unlikely to be material in the context of the total inventory held by organisations.

How we see it

In our view, an entity wishing to include a material amount of overhead of a borderline nature must ensure it can sensibly justify its inclusion under the provisions of FRS 102 by presenting an analysis of the function and its contribution to the production process similar to the bulleted guidance above.

3.2.7 Borrowing costs

In limited circumstances, borrowing costs may be included in the cost of inventories. Section 25 allows entities to adopt an accounting policy of capitalising borrowing costs that are directly attributable to the acquisition, construction or production of a qualifying asset as part of the cost of that asset. [FRS 102.25.2]. Qualifying assets are assets that necessarily take a substantial period of time to get ready for their intended use or sale and may include inventories. [FRS 102 Appendix I]. Inventories that are manufactured in large quantities on a repetitive basis are unlikely to meet the definition of qualifying assets. However, any manufacturer that produces small quantities of inventories over a long period of time (e.g., maturing stocks of wine or whisky) will have an accounting policy choice as to whether to include borrowing costs in the cost of these inventories. This is discussed further in Chapter 27.

3.2.8 Inventories acquired through a non-exchange transaction

Entities may sometimes enter into non-exchange transactions whereby the entity gives value to or receives value from another entity without directly receiving or giving approximately equal value in exchange.

[FRS 102 Appendix I].

Where inventories are acquired through a non-exchange transaction, their cost must be measured at their fair value as at the date of acquisition. [FRS 102.13.5A]. For entities other than public benefit entities, the fair value of inventories acquired through a non-exchange transaction must be determined by reference to the guidance Section 2A, which is discussed in Chapter 10.

For public benefit entities and entities within a public benefit entity group, Section 34 provides additional guidance on non-exchange transactions. As part of their normal business operations, public benefit entities may receive donations of cash, goods and services, and legacies which would meet the definition of non-exchange transactions. Public benefit entities and entities within a public benefit entity group must recognise inventories acquired through a non-exchange transaction at fair value only when required by Section 34. [FRS 102.13.5A]. Accounting for non-exchange transactions by public benefit entities and entities within a public benefit entity group is discussed further in Chapter 36 at 6.

3.2.9 Joint products and by-products

A production process may result in more than one product being produced simultaneously, for example when joint products are produced or where there is a main product and a by-product. If the costs of raw materials or converting each product are not separately identifiable, they must be allocated between the products on a rational and consistent basis. This may be, for example, based on the relative sales value of each of the products, either at the stage in the production process when the products become separately identifiable, or once production is complete. If the value of the by-product is immaterial, as is often the case, it must be measured at selling price less costs to complete and sell, with this amount then deducted from the cost of the main product. [FRS 102.13.10]. In the extractive industries, it is common for more than one product to be extracted from the same reserves therefore, joint and by-products are further discussed in the EY publication, International GAAP®.

3.2.10 Service providers

The February 2026 amendments to FRS 102, which are part of the 2024 Periodic Review, removed paragraph 13.114 which dealt specifically with the inventories of service providers - effectively their work in progress. This was replaced with the relevant requirements in Section 23 on costs to fulfil a contract. Section 23 divides contract fulfilment costs into two categories: (1) costs that give rise to an asset; and (2) costs that are expensed as incurred. When determining the appropriate accounting treatment for such service provider costs, Section 23 makes it clear that any other applicable sections of FRS 102 (e.g., Section 13, Section 17 and Section 18) are considered before Section 23. That is, if costs incurred in fulfilling a contract are within the scope of another section of FRS 102, an entity accounts for those costs in accordance with those other sections of FRS 102. [FRS 102.23.116, FRS 102.23.117]. Accordingly, if those other sections of FRS 102 preclude capitalisation of a particular cost, then an asset cannot be recognised under Section 23. If the costs incurred to fulfil a contract are not within the scope of another section of FRS 102, an entity capitalises such costs only if they meet all the criteria in Section 23 for the capitalisation of such costs (see Chapter 25 at 10.3.2).

3.2.11 Inventories held for distribution at no or nominal consideration

Inventories held for distribution at no or nominal consideration includes items such as advertising and promotional material, and also items that may be distributed to beneficiaries by public benefit entities. [FRS 102.A3.36].

FRS 102 requires inventories held for distribution at no or nominal consideration to be measured at the lower of cost adjusted, when applicable, for any loss of service potential and replacement cost. [FRS 102.13.4A]. Inventories held for distribution at no or nominal consideration could include advertising and promotional material.

FRS 102 provides no further guidance on how, or at what unit of account, service potential must be measured. It does not specify whether this must be at the individual asset level (e.g., the extent to which an individual catalogue is expected to generate future revenue for the entity) or based on a class of promotional material (e.g., the extent to which all catalogues printed for a particular year/season are expected to generate future revenue for the entity).

How we see it

In our view, an entity wishing to recognise a material inventory balance for advertising and promotional expenditure must ensure that it can sensibly justify how the entity will derive future benefit from the use of the materials.

The measurement basis described above (i.e., lower of cost adjusted for loss of service potential and replacement cost) is an application of fair value accounting as permitted by Schedule 1 to the Regulations, however for inventories held for distribution at no or nominal value (particularly items distributed to beneficiaries by public benefit entities) there is unlikely to be a significant difference between replacement cost and fair value. [FRS 102.A3.37].

The carrying amount of inventories held for distribution at no or nominal consideration must be recognised as an expense when the inventories are distributed. [FRS 102.13.20A].

3.2.12 Agricultural produce harvested from biological assets

Inventories comprising agricultural produce that an entity has harvested from its biological assets must be measured on initial recognition, at the point of harvest, at either: [FRS 102.13.15]

- Their fair value less costs to sell.

Or

- The lower of cost and estimated selling price less costs to complete and sell.

For the purposes of applying Section 13, this amount becomes the cost of the inventories at that date.

3.2.13 Cost measurement methods

FRS 102 allows the use of standard costing methods, the retail method or most recent purchase price for measuring the cost of inventories if the result approximates cost. [FRS 102.13.16].

Standard costs must take into account normal levels of materials and supplies, labour, efficiency and capital utilisation. They must be reviewed regularly and revised where necessary. [FRS 102.13.16].

The retail method measures cost by reducing the sales value of the inventory by the appropriate percentage gross margin. This method is typically used in businesses with high volumes of various line items of inventory, where similar marks-ups are applied to ranges of inventory items or groups of items. In these circumstances, the cost of the inventory is determined by converting selling prices to cost by removing the normal mark-up.

A judgemental area in applying the retail method is in determining the margin to be removed from the selling price of inventory in order to convert it back to cost. The percentage has to take account of circumstances in which inventories have been marked down to below original selling price. Adjustments have to be made to eliminate the effect of these markdowns so as to prevent any item of inventory being valued at less than both its cost and its net realisable value. In practice, however, entities that use the retail method apply a gross profit margin computed on an average basis appropriate for departments and/or ranges, rather than applying specific mark-up percentages.

As noted above, FRS 102 also allows the use of the most recent purchase price as a cost measurement method. This method arrives at the cost of stock by applying the latest purchase price to the total number of units in stock. IAS 2 is silent on the use of this methodology. In practice, the use of the most recent purchase price is not a common method of measuring the cost of inventory. Where it is used, care must be taken to ensure that the result does approximate to the actual cost of inventories.

Items of inventory that are not interchangeable (i.e., where one item of inventory cannot easily be replaced with another item of inventory held by the entity) and goods or services produced and segregated for specific projects must have their costs specifically identified. [FRS 102.13.17]. These costs must be matched with the goods or services physically sold. Due to the clerical effort required, this is likely to be feasible only where there are relatively few high value items being bought or produced. Consequently, it would normally be used where inventory comprised items such as antiques, jewellery and vehicles in the hands of dealers.

When inventory comprises a large number of ordinarily interchangeable items, FRS 102 requires inventory to be measured using either a first-in, first-out (FIFO) or a weighted average cost formula. [FRS 102.13.18].

The FIFO method assumes that when inventories are sold or used in a production process, the oldest are sold or used first. Consequently, the balance of inventory on hand at any point represents the most recent purchases or production. The weighted average method involves the computation of an average unit cost by dividing the total cost of units by the total number of units. The average unit cost then has to be revised with every receipt of inventory, or at the end of predetermined periods. In practice, where it is not possible to value inventory on an actual costs basis, the FIFO method is generally used. However, the weighted average method is widely used in computerised inventory systems. In times of low inflation, or where inventory turnover is relatively quick, the FIFO and weighted average methods give similar results.

The last-in, first-out (LIFO) method of measuring the cost of inventory is not permitted by FRS 102. [FRS 102.13.18]. The LIFO method assumes that when inventories are sold or used in a production process, the most recent purchases are sold or used first. This method is an attempt to match current costs with current revenues so that the profit and loss account excludes the effects of holding gains. However, this results in inventories being stated on balance sheet at amounts which may bear little or no relationship to recent cost levels.

FRS 102 makes it clear that the same cost formula must be used for all inventories having a similar nature and use to the entity. However, different cost formulas may be justified for inventories with a different nature or use. [FRS 102.13.18].

3.2.14 Costs of real estate inventory

3.2.14.1 Allocation of costs to individual units in multi-unit developments

A real estate developer of a multi-unit complex will be able to track and record various costs that are specific to individual units, such as individual fit out costs. However, there will also be various costs that are incurred which are not specific to any individual unit, such as the costs of land and any shared facilities, and a methodology will be required to allocate these costs to the individual units. This will of course impact the profit that is recognised on the sale of each individual unit.

There are two general approaches to this allocation:

- The first approach is to allocate these non-unit specific costs based on some relative cost basis. A reasonable proxy of relative cost is likely to be the size of each unit and hence an appropriate methodology would be to allocate the non-unit specific cost per square metre to the individual units based upon the floor area of each unit. Another proxy of (total) relative cost may be the use of the specific cost of each unit. Marking up the specific cost that is attributable to each unit by a fixed percentage so as to cover and account for the non-unit specific costs would also seem reasonable. This relative cost approach is consistent with the guidance under Section 13 in respect of allocation of overheads which requires a “systematic allocation of fixed and variable production overheads”. [FRS 102.13.8].
- The second approach would be to allocate these non-unit specific costs based on the relative sales value of each unit. Although this methodology is specifically referred to by the standard in the context of a production process that results in more than one product being produced simultaneously. [FRS 102.13.10].

How we see it

In our view, both approaches discussed above are acceptable under IAS 2 when allocating non-unit specific costs to individual units in a multi-unit complex. Whichever approach is adopted it must be applied consistently. In addition, the developer must initially, as far as is practicable, segregate the non-unit specific costs between any commercial, retail and residential components before applying these methodologies.

3.2.14.2 Property demolition and lease costs

During the course of a property redevelopment project, an existing building may need to be demolished in order for the new development to take place. Must the cost of the building to be demolished be capitalised as part of the construction cost for the new building or must the cost be charged to profit or loss?

In all such cases an entity will need to exercise judgement in assessing the facts and circumstances. There are three distinct scenarios to consider:

- The entity is the owner-occupier, in which case the matter falls under IAS 16.
 - The entity holds the property to earn rentals or for capital appreciation, in which case the matter falls under IAS 40.
- Or
- The entity sells such properties in its ordinary course of business.

If it is the strategy of the developer to sell the developed property after construction, the new development falls within the scope of IAS 2, as it would be considered held for sale in the ordinary course of business by the developer. If the entity purchased the property in question consisting of land and an old building, it is our view that on initial recognition, the entity classifies the land and building as two separate items of property, plant and equipment under IAS 16, and measures the land and building based on cost, allocated to the land and building on a relative fair value basis, consistent with the measurement at initial recognition in IFRS 3.2(b). [IFRS 3.2(b)].

How we see it

In our view, the cost of the old building as well as demolition costs and costs of developing the new one would be treated as inventory if:

- At the time of purchase, it is the entity's intention to demolish the existing building.
- And
- The building will not be used or leased out prior to its demolition.

The cost of the new development will still be subject to the normal 'lower of cost and net realisable value' requirements.

If the property in question was purchased in a prior reporting period and subsequently occupied, the land and building would have been separately recognised in accordance with the requirements of IAS 16 in that period. Depending on the facts and circumstances, if the existing building was unusable, or likely to be demolished by any party acquiring it, the entity might have concluded that a large part of the purchase price related to the land. In such cases, the carrying amount of the existing building will likely be minimal. If the existing building is demolished in subsequent periods in order for the new development to take place, the carrying amount of the old building will be derecognised in accordance with IAS 16 (see Chapter 20 at 3.4.1.G).

How we see it

Whilst IAS 16 requires that land and buildings must be accounted for separately, even when they are acquired together, we believe that it may be appropriate for the acquirer to allocate a large proportion of the purchase price to the land if the existing building is unusable or likely to be demolished.

When the building is demolished under the circumstances described above, our view is that its carrying amount which is derecognised in accordance with IAS 16 cannot be capitalised as part of the cost of the new building.

If a new development within the scope of IAS 2 is being constructed on land that is leased, the entity needs to determine whether the depreciation charge relating to the right-of-use asset represents a cost of conversion in bringing the inventories to their present location and condition as specified in IAS 2.12. If the entity concludes that this is the case, a systematic allocation of the depreciation of the right-of-use asset relating to that leased land used in the development process is included in the cost of the inventories.

[IAS 2.12].

3.2.15 Additional company law considerations

As an alternative to the historical cost accounting rules set out above, the Regulations allow that where materials and consumables inventories are of a kind that are constantly being replaced, they may be recorded at a fixed quantity and value if: [1 Sch 26, 1 Sch 26 (LLP)]

- Their overall value is not material to the company.
- And
- Their quality, value and composition are not subject to material variation.

This treatment is not generally permitted by Section 13 and would be appropriate only if the result approximated the cost of inventories as determined by applying the measurement requirements of Section 13.

3.3 Impairment of inventories

In accordance with the requirements of Section 27 *Impairment of Assets*, entities must assess inventories for impairment at the end of each reporting period. Inventories are impaired if their carrying value exceeds their selling price less costs to complete and sell. Inventories may become impaired due to damage, obsolescence or declining selling prices. Where inventories are impaired, the carrying amount must be written down to selling price less costs to complete and sell. [FRS 102.13.19]. The reduction in carrying value is an impairment loss and must be recognised immediately in profit or loss. [FRS 102.27.2].

Assessing inventories for impairment must normally be done on an item-by-item basis. However, in many circumstances it will be impracticable to determine the selling price less costs to complete and sell on this basis. Where this is the case, items of inventory may be grouped. This may be the case for items of inventory relating to the same product line that have similar purposes, or end uses and are produced and marketed in the same geographical area. [FRS 102.27.3].

3.3.1 Selling price less costs to complete and sell

Section 32 *Events after the End of the Reporting Period* states that “the sale of inventories after the end of a reporting period may give evidence about their selling price at the end of the reporting period for the purpose of assessing impairment at that date.” [FRS 102.32.5(b)(ii)]. Events that have impacted selling prices after the end of the reporting period, such as damage to inventories as a result of a warehouse fire post year end, would not be relevant to the assessment of impairment at end of the reporting period. Other than this, FRS 102 gives no guidance on how to determine selling price or what costs must be included when assessing costs to complete and sell.

The requirement to measure inventories at the lower of cost and selling price less costs to complete and sell under FRS 102 is similar to the requirement under IFRS to carry inventories at the lower of cost and net realisable value. Entities may therefore choose to look to IFRS for further guidance in this area.

IFRS defines net realisable value as “the estimated selling price in the ordinary course of business less the estimated costs of completion and the estimated costs necessary to make the sale.” [IAS 2.6].

IFRS is explicit that materials and other supplies held for use in the production of inventories are not written down below cost if the final product in which they are to be used is expected to be sold at or above cost. [IAS 2.32]. Whilst this is not explicit in FRS 102, we consider that this is consistent with the measurement principle of FRS 102. As such, we would not expect a whisky distiller, for example, to write down an inventory of grain because of a fall in the grain price, so long as it expected to sell the whisky at a price sufficient to recover cost. Conversely, if a provision is required in respect of finished goods, then work in progress and raw materials must also be reviewed to see if any further provision is required.

In estimating net realisable value, IFRS requires that entities must take into consideration the purpose for which inventory is held. For example, the net realisable value of inventory held to satisfy firm sales contracts is based on that contract price. [IAS 2.31]. This reflects the fact that net realisable value, unlike fair value, is an entity specific value.

How we see it

In our view, selling price less costs to complete and sell is also an entity specific measure intended to reflect the amount that the entity actually expects to make from selling particular inventories.

IAS 2 provides detailed guidance on determining net realisable value, however, the standard does not provide further guidance on how to determine “estimated costs necessary to make the sale”, a key component of the definition of net realisable value. Without detailed guidance on which costs to include when estimating net realisable value, entities need to apply judgement, which may include considering the nature of their products, sales channel (for example, in-store or online sales) and industry. This has led to diversity in practice. Incremental costs are often the starting point before considering whether additional costs need to be included and, in some cases, entities may have only considered those costs that are incremental.

The IFRS IC received a request for clarification on how to determine which costs must be included as part of the costs necessary to make the sale when determining the net realisable value in accordance with IAS 2. In June 2021, the IFRS IC decided not to add the matter to its standard-setting agenda. The IFRS IC observed that paragraph 28 of IAS 2 describes the objective of writing inventories down to their net realisable value which is to avoid inventories being carried “in excess of amounts expected to be realised from their sale”. [IAS 2.28]. The IFRS IC further observed that the requirement in paragraph 28 of IAS 2 does not allow an entity to limit such costs to only those that are incremental, thereby potentially excluding costs the entity must incur to sell its inventories but that are not incremental to a particular sale. Including only incremental costs could fail to achieve the objective set out in that paragraph of the standard. Judgement will be needed to determine which costs are necessary to make the sale considering each entity’s specific facts and circumstances, including the nature of the inventories.⁹⁶ There are a range of possibilities beyond the incremental cost approach: from direct costs at the point of sale (which might include, for example, a portion of the cost of internal sales staff or the cost of a special promotion campaign) to full costs (which might include costs such as depreciation or amortisation).

⁹⁶ [IFRIC Update](#), June 2021, Addendum. Available on the IFRS Foundation’s website.

Furthermore, within that range, direct costs at the point of sale may be quite similar to incremental costs. Which costs are considered necessary to sell inventories may vary by entity, depending on the nature of the inventories, the applicable industry, sales channel and cost structure.

How we see it

The incremental cost approach is no longer permitted if it excludes non-incremental costs that must be incurred to sell inventories. We do not believe it would be possible to limit which other approaches might be considered appropriate, depending on the specific facts and circumstances. This is because IAS 2 does not specify which costs to consider.

3.3.2 Reversal of impairment of inventory

As noted at 3.3 above, FRS 102 requires entities to assess inventories for impairment at the end of each reporting period. When the circumstances that previously caused inventories to be written down no longer exist, or when there is clear evidence of an increase in selling price less costs to complete and sell because of changed economic circumstances, the amount of the write down is reversed. The amount of the reversal cannot be greater than the amount of the original write down. This means that the new carrying amount of inventories following the reversal of an impairment will be the lower of its cost and the revised selling price less costs to complete and sell. [FRS 102.27.4].

3.4 Recognition of inventory in profit or loss

Section 13 states the following: [FRS 102.13.20]

Extract from Section 13

20 When inventories are sold, the entity shall recognise the carrying amount of those inventories as an expense in the period in which the related revenue is recognised.

However, some inventories go into the creation of another asset, such as self-constructed property, plant or equipment. In this case, the inventories form part of the cost of the other asset and are accounted for subsequently in accordance with the section of FRS 102 relevant to that asset type. [FRS 102.13.21].

Any impairment loss on inventory must be recognised immediately as an expense in profit or loss. [FRS 102.27.2].

The carrying amount of inventories held for distribution at no or nominal consideration (as discussed at 3.2.11 above) is recognised as an expense when the inventories are distributed. [FRS 102.13.20A].

3.5 Presentation and disclosure

3.5.1 Presentation of inventories

As discussed in Chapter 6 at 4.1, UK companies and qualifying partnerships applying Schedule 1 to the Regulations are permitted to use 'adapted formats' as an alternative to the statutory formats as set out in section B of Part 1 of Schedule 1. FRS 102's presentation requirements for adapted formats are similar but not identical to formats included in IAS 1 *Presentation of Financial Statements*. The two alternatives are set out below.

Where entities apply the statutory balance sheet formats, they are required by Schedule 1 to the Regulations to present inventories on the face of the balance sheet. Inventories must be further analysed, either on the face of the balance sheet or within the notes to the accounts, into:

- Raw materials and consumables.
- Work in progress.
- Finished goods and goods for resale.
- And
- Payments on account.

The classifications used in the disaggregation may be adapted dependent upon the nature of the company's business. [1 Sch 4(1)]. In practice, most companies present the disaggregation as a note to the financial statements.

Where 'adapted formats' are used, FRS 102 requires that inventories are shown on the face of the balance sheet. [FRS 102.4.2A]. Inventories must be further analysed, either in the statement of financial position or the notes, between amounts of inventories: [FRS 102.4.2B]

- Held for sale in the ordinary course of business.
 - In the process of production for such sale.
- And
- In the form of materials or supplies to be consumed in the production process or in the rendering of services.

3.5.2 Disclosure of inventories

FRS 102 requires an entity to disclose the following: [FRS 102.13.22]

Extract from Section 13

- 22 The entity shall disclose:
- (a) the accounting policies adopted in measuring inventories, including the cost formula used;
 - (b) the total carrying amount of inventories and the carrying amount in classifications appropriate to the entity;
 - (c) [Deleted]
 - (d) impairment losses recognised or reversed in profit or loss in accordance with Section 27 Impairment of Assets; and
 - (e) the carrying amount of inventories pledged as security for liabilities.

The disclosure requirements of FRS 102 are similar to those required by IFRS, although IAS 2 also contains additional disclosure requirements not replicated in Section 13.

Where an entity has included borrowing costs in cost of inventories (see 3.2.7 above), the disclosure requirements of Section 25 will also be relevant. See Chapter 27 at 4.

3.5.2.A Additional company law disclosures

The Regulations includes the following additional disclosure requirements with respect to inventories:

- If finance costs are included in the cost of inventory, this fact, along with the amount included. [1 Sch 27(3)].
 - For large and medium companies where a costing method (such as FIFO, weighted average price or similar) has been applied, the difference between carrying value and replacement cost of inventories where this is material. [1 Sch 28(3)]. This may be determined by reference to the most recent purchase or production cost before the balance sheet date if this is considered by the directors of the company to give a more appropriate comparison. [1 Sch 28(5)].
- And
- Where there has been a departure from the historical cost convention, the fact that this is the case, the balances affected and the basis of valuation adopted. [1 Sch 34].

4 Summary of GAAP differences

The following table shows the differences between FRS 102 and IFRS.

	FRS 102	IFRS
Scope	Section 13 applies to inventories other than financial instruments and biological assets related to agricultural activity and agricultural produce at the point of harvest. The measurement rules of Section 13 also exclude inventories measured at fair value less costs to sell through profit or loss. See 3.1 above.	IAS 2 is similar to FRS 102 although there is a specific exclusion for commodity broker-dealers who measure inventories at fair value through profit or loss rather than a general exclusion for inventories measured in this way.
Measurement of inventory	Inventories are measured at the lower of cost and estimated selling price less costs to complete and sell. Section 13 provides prescriptive guidance on what may be and what must not be included in the cost of inventory. For inventories that meet the definition of qualifying assets, entities may choose to adopt an accounting policy of capitalising borrowing costs. See 3.2 above.	The measurement of inventory is similar to FRS 102, although borrowing costs must be capitalised if inventories meet the definition of qualifying assets.
Costs of inventories of a service provider	Section 13 provides specific guidance on the cost of inventories of a service provider. Inventories of a service provider are measured at the cost of their production. Costs consist primarily of the labour and other costs of personnel directly involved in providing the service, including supervisory personnel, and attributable overheads. See 3.2.10 above.	IAS 2 contains no guidance on cost of inventories of a service provider. IFRS 15 states that costs incurred in fulfilling a contract with a customer which are within the scope of another IFRS (e.g., IAS 2) must be accounted for under that standard. Otherwise, those costs are accounted for under IFRS 15 criteria. In practice, we believe any material GAAP difference is unlikely.
Impairment of inventory	FRS 102 provides limited guidance on assessing impairment of inventory. Inventory is impaired if its carrying amount exceeds its selling price less costs to complete and sell. See 3.3 above.	IAS 2 refers to 'net realisable value' rather than 'estimated selling price less costs to complete and sell' and provides substantial guidance on the identification of net realisable value. However, it is unlikely that a GAAP difference would arise in practice.
Inventory purchased on deferred payment terms	If the inventory is a qualifying asset and the entity adopts a policy of capitalising borrowing costs, the interest expense must be added to the cost of inventory. See 3.2.7 above.	If the inventory is a qualifying asset, the interest expense must be added to the cost of inventory.

FRS 102		IFRS
Inventories held for distribution at no or nominal consideration	These inventories, such as advertising and promotion items or items to be distributed to beneficiaries by public benefit entities, must be measured at cost adjusted, when applicable, for any loss of service potential and replacement cost. This is an application of fair value accounting. The carrying amount of those inventories must be recognised as an expense when they are distributed. See 3.2.11 above.	No guidance on inventories held for distribution at no or nominal consideration. IAS 38 - Intangible Assets - requires the cost of advertising and promotional material, such as mail order catalogues, to be recognised as an expense once the entity gains access to those materials (i.e., owns the goods). A GAAP difference may therefore arise.
Inventories acquired through non exchange transactions	Where an entity receives inventories without giving approximately equal value in exchange, the cost of the inventories must be measured as their fair value at the date of acquisition. See 3.2.8 above.	IFRS provides no specific guidance on inventories that are acquired through a non-exchange transaction.
Disclosures	FRS 102 requires fewer disclosures than IAS 2, although Company Law disclosures are also required. See 3.5.2 above.	IAS 2 requires some additional disclosures beyond those required by FRS 102. Company law disclosures are not required by entities reporting under IFRS.

Appendix A - Defined terms

Extract from FRS 102

Appendix I

Glossary

asset	A resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity.
fair value	The amount for which an asset could be exchanged, a liability settled, or an equity instrument granted could be exchanged, between knowledgeable, willing parties in an arm's length transaction. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in the Appendix to Section 2 Concepts and Pervasive Principles shall be used in determining fair value.
inventories	Assets: (a) held for sale in the ordinary course of business; (b) in the process of production for such sale; or (c) in the form of materials or supplies to be consumed in the production process or in the rendering of services.
inventories held for distribution at no or nominal consideration	Assets that are; (a) held for distribution at no or nominal consideration in the ordinary course of operations; (b) in the process of production for distribution at no or nominal consideration in the ordinary course of operations; or (c) in the form of material or supplies to be consumed in the production process or in the rendering of services at no or nominal consideration.
non-exchange transaction	A transaction whereby an entity receives value from another entity without directly giving approximately equal value in exchange, or gives value to another entity without directly receiving approximately equal value in exchange.
public benefit entity	An entity whose primary objective is to provide goods or services for general public, community or social benefit and where any equity is provided with a view to supporting the entity's primary objectives of rather than with a view to providing a financial return to equity providers, shareholders and members.
public benefit entity group	A public benefit entity parent and all of its wholly-owned subsidiaries.
qualifying asset	An asset that necessarily takes a substantial period of time to get ready for its intended use or sale. Depending on the circumstances any of the following might be qualifying assets: (a) inventories; (b) manufacturing plants; (c) power generation facilities; (d) intangible assets; and (e) investment properties. Financial assets, and inventories that are produced over a short period of time, are not qualifying assets. Assets that are ready for their intended use or sale when acquired are not qualifying assets.
service potential	The capacity to provide services that contribute to achieving an entity's objectives. Service potential enables an entity to achieve its objectives without necessarily generating net cash inflows.

Overview

Section 14 *Investments in Associates* sets out the accounting for investments in associates and the equity method of accounting. An associate is an entity over which the investor has significant influence and that is neither a subsidiary nor an interest in a joint venture. Joint ventures that are classified as jointly controlled entities are also generally accounted for using the equity method as described in Section 14.

The equity method of accounting involves a modified form of consolidation of the results and assets of the investees in the investor's financial statements. The essence of the equity method of accounting is that rather than full scale consolidation on a line-by-line basis, it requires incorporation of the investor's share (adjusted for basis differences, like fair value adjustments arising on initial acquisition of the interest in the associate or joint venture) of the investee's:

- Net assets, in one line in the investor's consolidated statement of financial position.
- Profit or loss, in one line in the investor's consolidated statement of profit or loss.
- Other comprehensive income, in one line in the investor's consolidated statement of other comprehensive income.

There has been debate about whether the equity method of accounting is primarily a method of consolidation or a method of valuing an investment as FRS 102 nor IFRS provide specific guidance either way. An investor that controls a subsidiary has control over the assets and liabilities of that subsidiary. While an investor that has significant influence over an associate or joint control of a joint venture controls its holding in the shares of the associate or joint venture, it does not control the assets and liabilities of that associate or joint venture. Therefore, the investor does not account for the assets and the liabilities of the associate or joint venture, but accounts only for its investment in the associate or joint venture as a whole. As there is no clear principle underlying the application of the equity method, different views on how to account for certain transactions for which the standard has no clear guidance might be taken, depending on which principle (i.e., consolidation or valuation of an investment) is deemed to take precedence.

What you need to know

- An investor has significant influence over an associate when it has the power to participate in the financial and operating policy decisions of the investee but does not have control or joint control of those policies.
- A holding of 20% or more of the voting power of the investee is presumed to give rise to significant influence, unless it can be clearly demonstrated that this is not the case.
- In its consolidated financial statements, an investor accounts for investments in associates using the equity method, unless the associate is held as part of an investment portfolio.
- Under the equity method, an associate is first recognised at its cost, including any directly attributable expenditures.
- The carrying amount is increased or decreased to recognise the investor's share of the profit or loss of the associate after the date of acquisition adjusted for the effect of fair value adjustments on acquisition and goodwill amortisation. Distributions received from the associate reduce the carrying amount of the investment.
- Equity method losses are recognised until the investor's interest in the associate is reduced to zero.
- The equity method is discontinued when the investment ceases to be an associate.
- Section 14 permits entities that are not parents, and parent entities preparing separate financial statements, to account for their investment in associates at cost less impairment losses, at fair value with changes in fair value recognised through other comprehensive income (without recycling) or at fair value with changes in fair value recognised through profit or loss.

1 Introduction

Section 14 applies to investments in associates in:

- Consolidated financial statements
- And
- The individual financial statements of an investor that is not a parent

In its separate financial statements, an entity that is a parent accounts for investments in associates in accordance with paragraphs 9.26 and 9.26A of Section 14, i.e., at cost less impairment losses, fair value with changes in fair value recognised through other comprehensive income (without recycling) or at fair value with changes in fair value recognised through profit or loss. See Chapter 8 at 4 for further detail on individual and separate financial statements.

2 Comparison between Section 14 and IFRS

There are a number of differences between the accounting and disclosure requirements in Section 14 compared to IFRS accounting standards (IAS 28 *Investments in Associates and Joint Ventures*). The key differences are discussed below and summarised at 5 below.

2.1 Measurement - individual and separate entity financial statements

Section 14 permits entities that are not parents to account for their investment in associates at cost less impairment, at fair value with changes in fair value recognised through other comprehensive income (unless reporting gains and losses on revaluations in accordance with paragraphs 17.15E and 17.15F) or at fair value with changes in fair value recognised through profit or loss (see 3.2.1.A below). [FRS 102.14.4]. The same accounting policy choice is available for an investor preparing separate financial statements in accordance with Section 9 *Consolidated and Separate Financial Statements*. [FRS 102.9.26].

Under IFRS, an entity that is not a parent must prepare financial statements whereby its investments in associates are accounted for under the equity method accounting unless it meets the criteria for exemption. [IAS 28.16, IAS 28.17]. An election is available for investments in associates held by, or indirectly through, a venture capital organisation, mutual fund, unit trust or similar entities including investment-linked insurance funds, to measure their investment in an associate at fair value through profit or loss in accordance with IFRS 9 *Financial Instruments*. [IAS 28.18]. This election extends to portions of an investment held indirectly through venture capital and similar organisations, whereby the investor may elect to measure the portion of the investment so held at fair value through profit and loss in accordance with IFRS 9, regardless of whether the vehicle the investment is held through has significant influence over that portion of the investment. If this election is made, the equity method must be applied to the remaining portion of the investment in an associate that is not held through such a vehicle. [IAS 28.19]. This election also applies in the investor's individual financial statements, but in any case, an investor preparing separate financial statements under IFRS, has an accounting policy choice of measuring investments in associates at cost, fair value in accordance with IFRS 9 or the equity method of accounting. [IAS 27.10].

2.2 Investment portfolios/funds

Under Section 14, an investor that is a parent and has investments in associates that are held as part of an investment portfolio is required to measure those investments at fair value with changes in fair value recognised in profit or loss in the consolidated financial statements. [FRS 102.14.4B].

Under IAS 28, the measurement of investments in associates at fair value through profit or loss in consolidated financial statements is an option that is available only for an entity that is a venture capital organisation, or a mutual fund, unit trust and similar entities including investment-linked insurance funds or one which holds its investments indirectly through such an entity. [IAS 28.18].

2.3 Accounting for the acquisition of an associate

Section 14 requires the use of Section 19 *Business Combinations and Goodwill* to determine the implicit goodwill on the acquisition of an associate. This goodwill is then amortised over its useful life.

[FRS 102.14.8(c), FRS 102.19.23].

Under IAS 28, the implicit goodwill is not amortised. [IAS 28.32(a)].

2.4 Loss of significant influence

Section 14 requires that where loss of significant influence is a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds and the carrying amount relating to the proportion disposed of. The carrying value of the equity interest retained at the date significant influence is lost becomes the cost of the retained investment and there is no re-measurement of the retained interest at fair value.

[FRS 102.14.8(i)(i)].

If the loss of significant influence is for reasons other than a partial disposal, for example as a result of a changes to the board of directors or equivalent governing body that results in a loss of significant influence, no gain or loss is recognised and the carrying value of the equity-accounted investment at the date significant influence is lost becomes the cost of the retained investment. [FRS 102.14.8(i)(ii)].

Under IFRS, where loss of significant influence is a result of a partial disposal, a gain or loss is recognised based on any difference between the disposal proceeds together with the fair value of any retained interest and the carrying amount of the total interest in the associate. Similarly, if the loss of significant influence is for reasons other than a partial disposal, a gain or loss is recognised based on the fair value of the retained interest and the carrying amount of the interest in the associate at that date. [IAS 28.22].

2.5 Transactions to create an associate

Section 9 sets out the requirements when an investor exchanges a business or other non-monetary asset for an interest in an associate. If the fair value of the consideration received by the investor exceeds the carrying value of the assets exchanged, any related goodwill and any cash given up, the investor recognises a gain. Any unrealised gain arising on the exchange is recognised in other comprehensive income. If the fair value of the consideration received is less than the carrying value of what has been exchanged, together with any related goodwill and cash given up, a loss is recognised in profit or loss (see 3.2.2.K below).

[FRS 102.9.31].

IFRS does not distinguish between realised and unrealised gains for equivalent transactions and requires that any gain or loss, realised or unrealised, is recognised in profit or loss. [IFRS 10 Appendix B.98].

3 Requirements of Section 14 for investments in associates

3.1 Definitions of an associate, and related terms

3.1.1 Associate

Section 14 defines an associate as an entity, including an unincorporated entity such as a partnership, over which an investor has significant influence and that is neither a subsidiary nor an interest in a joint venture. *[FRS 102.14.2].*

- A similar definition is contained in UK Company law which defines an 'associated undertaking' as an undertaking in which an undertaking included in the consolidation has a participating interest and over whose operating and financial policy it exercises a significant influence, and which is not:
- A subsidiary undertaking of the parent company.

Or

A joint venture dealt with in accordance with the paragraph on joint ventures. *[6 Sch 19(1)].*

- A 'participating interest' is an interest held by an undertaking in the shares of another undertaking which it holds on a long-term basis for the purpose of securing a contribution to its activities by the exercise of control or influence arising from or related to that interest. The interest in shares includes interests which are convertible into shares or options to acquire shares, regardless of whether they are currently exercisable. Additionally, interests held on behalf of an undertaking are to be treated as held by it. *[10 Sch 11(1), 10 Sch (3), 10 Sch (4)].*

3.1.2 Significant influence

Fundamental to the definition of an associate is the concept of significant influence. This is defined as "the power to participate in the financial and operating policy decisions of the associate but is not control or joint control over those policies". *[FRS 102.14.3].*

Under Section 14, a holding of 20% or more of the voting power of the investee (held directly or indirectly, through subsidiaries) is presumed to give rise to significant influence, unless it can be clearly demonstrated that this is not the case. Conversely, a holding of less than 20% of the voting power is presumed not to give rise to significant influence, unless it can be clearly demonstrated that significant influence does exist. The existence of a substantial or majority interest of another investor does not necessarily preclude the investor from having significant influence. *[FRS 102.14.3].* UK company law also contains a rebuttable presumption of significant influence when an undertaking holds 20% or more of the voting rights of another undertaking unless the contrary is shown. *[6 Sch 19(2)].*

How we see it

In our view, an entity considers both ordinary shares and other categories of shares in determining its voting rights, because Section 14 focuses on 'voting power'.

Other factors need to be considered to determine whether significant influence exists or not and to potentially rebut any presumptions above regarding voting power. The existence of significant influence can also be evidenced in the following ways:

- Representation on the board of directors or equivalent governing body of the investee.
- Participation in policy-making processes, including participation in decisions about dividends and other distributions.
- Material transactions between the entity and the investee.
- Interchange of managerial personnel.

Or

- Provision of essential technical information. *[FRS 102.14.3A].*

Significant influence may also exist over another entity through potential voting rights (see 3.1.2.D below).

An entity loses significant influence over an investee when it loses the power to participate in the financial and operating policy decisions of that investee. The loss of significant influence can occur with or without a change in absolute or relative ownership levels. It could occur, for example, as a result of a contractual agreement or when an associate becomes subject to the control of a government, court, administrator or regulator.

An entity with an interest in an associate will need to evaluate the facts and circumstances, whenever a change to those facts and circumstances is identified, to assess whether it is still able to exercise significant influence over the financial and operating policies of the investee.

The accounting for loss of significant influence over an associate is discussed at 3.2.2.J below.

3.1.2.A Lack of significant influence

The presumption of significant influence due to the existence of 20% or more of the voting power can sometimes be rebutted, for example when:

- The investor has tried and failed to obtain representation on the investee's board of directors.
 - The investee, other shareholders or regulatory authorities are opposing the investor's attempts to exercise significant influence.
 - The investor and investee sign an agreement under which the investor surrenders significant rights as a shareholder, such as a standstill agreement.
 - The investor is unable to obtain timely or adequate financial information required to apply the equity method.
- Or
- A group of shareholders that holds the majority ownership of the investee operates without regard to the views of the investor.

How we see it

Determining whether the presumption of significant influence has been overcome requires considerable judgement. In our experience, many regulators take a keen interest in these decisions.

3.1.2.B Holdings of less than 20% of the voting power

Although there is a presumption that an investor that holds less than 20% of the voting power in an investee does not have significant influence, [FRS 102.14.3(b)], where investments give rise to less than 20% of the voting power careful judgement is needed to assess whether there are other indicators that significant influence exists.

For example, an investor might be able to exercise significant influence in the following circumstances:

- The investor's voting power is much larger than that of any other shareholder of the investee.
 - The corporate governance arrangements are such that the investor can appoint members to the board, supervisory board or significant committees of the investee. The investor will need to apply judgement to the facts and circumstances to determine whether representation in the respective boards or committees is enough to provide significant influence.
- Or
- The investor has the power to veto significant financial and operating decisions.

How we see it

Determining whether the indicators above result in an investor having significant influence despite a holding of less than 20% of the voting power requires considerable judgement.

3.1.2.C Voting rights in UK company law

The provisions of paragraphs 5 to 11 of Schedule 7 to the 2006 Act (parent and subsidiary undertakings: rights to be taken into account and attribution of rights) apply in determining whether an undertaking holds 20% or more of the voting rights in another undertaking. [6 Sch 19(4)].

The 'voting rights' in an undertaking are the rights conferred on shareholders in respect of their shares or, in the case of an undertaking not having a share capital, on members, to vote at general meetings of the undertaking on all, or substantially all, matters. [6 Sch 19(3)].

Voting rights on shares held as security remain the rights of the provider of the security and are not considered if the rights are only exercisable in accordance with instructions from the provider of the security or in his interest. [7 Sch 8]. Similarly, voting rights that are held in a fiduciary capacity by the entity are treated as not held by the entity. [7 Sch 6]. Voting rights held by a nominee on behalf of the entity must be treated as held by the entity. Rights are regarded as held as nominee for another if the rights are only exercisable on the other's instruction or with the other's consent. [7 Sch 7].

The voting rights referred to above must be reduced by any rights held by the undertaking itself. [7 Sch 10].

3.1.2.D Potential voting rights

An entity may own share warrants, share call options, debt or equity instruments that are convertible into ordinary shares, or other similar instruments that have the potential, if exercised or converted, to give the entity voting power or reduce another party's voting power over the financial and operating policies of another entity (potential voting rights).

Section 14 requires that an entity must consider the existence and effect of potential voting rights in deciding whether significant influence exists. [FRS 102.14.8(b)]. Potential voting rights must only be considered if they are currently exercisable or convertible. [FRS 102.14.3A].

Potential voting rights are not currently exercisable or convertible when they cannot be exercised or converted until a future date or until the occurrence of a future event. [FRS 102.14.3A]. The meaning of currently exercisable or convertible is discussed further in Chapter 8 at 3.2.1.

Consistent with that discussion, IAS 28 (on which the requirements of Section 14 are based) states that in assessing whether potential voting rights contribute to significant influence, an entity must examine:

- All facts and circumstances (including the terms of exercise of the potential voting rights) both of the reporting entity and of other parties.

And

- Any other contractual arrangements (whether considered individually or in combination) that affect potential voting rights, except the intention of management and the financial ability to exercise or convert those potential voting rights. [IAS 28.8].

3.1.2.E Voting rights held in a fiduciary capacity

Voting rights on shares held as security by an entity remain the rights of the provider of the security and are generally not taken into account if the rights are only exercisable in accordance with instructions from the provider of the security or in his interest. Similarly, voting rights that are held in a fiduciary capacity may not be those of the entity itself. If voting rights are held by a nominee on behalf of the entity, they must be taken into account. [7 Sch 6, 7 Sch 7, 7 Sch 8].

3.2 Measurement

3.2.1 Accounting policy options

3.2.1.A Investor not a parent

An entity that is not a parent accounts for investments in associates in its individual financial statements either:

- Using the cost model (see 3.2.3 below).
- Fair value with changes in fair value recognised in OCI (or profit or loss) in accordance with paragraphs 15E and 15F of Section 17 *Property, Plant and Equipment*

Or

- At fair value with changes in fair value recognised in profit or loss (see 3.2.4 below and Chapter 4). [FRS 102.14.4].

The measurement options are an accounting policy choice. Section 14 does not contain the additional guidance in Section 9 that requires a parent to apply the same accounting policy to all investments in a single class. [FRS 102.9.26]. A class is a grouping of assets of a similar nature and use in an entity's operations. [FRS 102 Appendix I]. However, applying the GAAP hierarchy in Section 10 as discussed in Chapter 9 at 3.2, it is logical to apply the same accounting policy to a single class of associates. A discussion of the meaning of class of investment in this context is in Chapter 8 at 4.2.

How we see it

As discussed in Chapter 8 at 4.2, in our view, associates or jointly controlled entities held as part of an investment portfolio could be considered as a separate class from other associates or jointly controlled entities in the separate financial statements of a parent. While Sections 14 and 15 do not specifically refer to different classes of associates and jointly controlled entities, we believe that an entity that is not a parent may similarly adopt a different accounting policy in accounting for associates and jointly controlled entities held as part of an investment portfolio to that applied to other associates and jointly controlled entities in its individual financial statements.

There is no option in Section 14 to use the equity method of accounting in individual financial statements even though permitted by Regulations. *[FRS 102.BC.A.28, 1 Sch 29A]*. However, the individual financial statements of an investor that is not a parent must disclose summarised financial information about its investments in associates, along with the effect of including those investments as if they had been accounted for using the equity method. Investing entities that are exempt from preparing consolidated financial statements, or would be exempt if they had subsidiaries, are exempt from this requirement. *[FRS 102.14.15A]*.

3.2.1.B Investor that is a parent

In its consolidated financial statements, an investor that is a parent accounts for its investments in associates using the equity method of accounting (see 3.2.2 below), subject to the exception below. *[FRS 102.14.4A]*.

When an associate is held as part of an investment portfolio it is measured at fair value with changes in fair value recognised in profit or loss in the consolidated financial statements. *[FRS 102.14.4B]*.

An investment is held as part of an investment portfolio if its value to the investor is through fair value as part of a directly or indirectly held basket of investments rather than as a media through which the investor carries out business. A basket of investments is indirectly held if an investment fund holds a single investment in a second investment fund which, in turn, holds a basket of investments. In some circumstances, it may be appropriate for a single investment to be considered an investment portfolio, for example when an investment fund is first being established and is expected to acquire additional investments. (see Chapter 8 at 3.4.2.A). *[FRS 102 Appendix I]*.

An entity that is a parent accounts for its investments in associates in its separate financial statements in accordance with paragraphs 9.26 and 9.26A of Section 9 (see Chapter 8 at 4.2). *[FRS 102.14.1]*.

3.2.2 Equity method

Under the equity method, an investment is initially recognised at the transaction price (including transaction costs) and is subsequently adjusted to reflect the investor's share of: *[FRS 102.14.8]*

- Profit or loss
- Other comprehensive income
- And
- Equity of the associate

The investor's share of the associate's profit or loss is recognised in the investor's profit or loss. *[FRS 102.5.5, FRS 102.5.5B, 6 Sch 20(3)]*. The investor's share of the associate's other comprehensive income is recognised in the investor's statement of comprehensive income. *[FRS 102.5.5A(b)]*.

Transaction costs are defined in FRS 102 in the context of financial instruments as incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or liability. An incremental cost is one that would not have been incurred if the entity had not acquired, issued or disposed of the financial asset or liability. *[FRS 102 Appendix I]*. In the context of fair value measurement, transactions costs are considered to be the costs to sell an asset or transfer a liability in the principal or most advantageous market and are directly attributable to the disposal of the asset or transfer of the liability and result directly from and are essential to that transaction and would not have been incurred had the decision to sell the asset or transfer the liability not been made. *[FRS 102 Appendix I]*.

In the context of Section 14, transaction costs comprise any costs directly attributable to the acquisition of the interest in the associate.

Illustration 3-1 below demonstrates basic application of the equity method.

Illustration 3-1: Application of the equity method

On the first day of its financial year, Entity A acquires a 35% interest in Entity B, over which it exercises significant influence. A paid £475,000 for its interest in B. The carrying value of B's net identifiable assets at acquisition date was £900,000, and the fair value was £1,100,000. The difference of £200,000 relates to an item of property, plant and equipment with a remaining useful life of 10 years. During the year, B made a profit of £80,000 and paid a dividend of £120,000. B also had a gain in other comprehensive income of £20,000 during the year. Goodwill is assumed to have a 10 year useful life. For the purposes of the example, any deferred tax implications have been ignored.

A accounts for its investment in B under the equity method as follows:

	£	£
Acquisition of investment in B		
Share in carrying value of B's net assets: 35% of £900,000	315,000	
Share in fair valuation of B's net assets: 35% of (£1,100,000 - £900,000) *	70,000	
Goodwill on investment in B: £475,000 - £315,000 - £70,000 *	90,000	
Cost of investment		475,000
Profit during the year		
Share in the profit reported by B: 35% of £80,000	28,000	
Adjustment to reflect additional depreciation on fair value adjustment* 35% of ((£1,100,000 - £900,000) ÷ 10 years)	(7,000)	
Goodwill amortisation (£90,000 ÷ 10 years)*	(9,000)	
Share of profit in B recognised in income by A (equity method income)		12,000
Share of other comprehensive income recognised by A: 35% of £20,000		7,000
Dividend received by A during the year		
35% of £120,000 (debit cash, credit investment)		(42,000)
End of the financial year		
Share in carrying value of B's net assets:		
£315,000 + 35% (£80,000 - £120,000 + £20,000)	308,000	
Share in fair valuation of B's net assets: £70,000 - £7,000*	63,000	
Goodwill on investment in B: £90,000 - £9,000*	81,000	
Closing balance of A's investment in B		452,000

* These line items are often referred to as 'basis differences' and are combined with the ones immediately above.

3.2.2.A Date of commencement of equity accounting

An investor begins equity accounting for an associate from the date on which it obtains significant influence (and is not otherwise exempt from equity accounting). In most situations, this is when the investor purchases the investment in the associate. However, it may be that the investor obtains significant influence as a result of a piecemeal acquisition. These are discussed at 3.3.1.B below.

3.2.2.B Date of associate's financial statements

In applying the equity method, the investor must use the financial statements of the associate as of the same date as the financial statements of the investor unless it is impracticable to do so. [FRS 102.14.8(f)]. Applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so. [FRS 102 Appendix I].

Otherwise, an investor must use the most recently available financial statements of the associate. Adjustments are then made for the effects of significant transactions or events, for example a sale of a significant asset or a major loss on a contract, that occurred between that date and the date of the investor's financial statements. [FRS 102.14.8(f)].

3.2.2.C Associate's accounting policies

If an associate uses accounting policies different from those of the investor for like transactions and events in similar circumstances, adjustments must be made to conform the associate's accounting policies to those of the investor when the associate's financial statements are used by the investor in applying the equity method unless it is impracticable to do so. *[FRS 102.14.8(g)]*.

In practice, this may be difficult, since an investor's influence over an associate, although significant, may still not be sufficient to ensure access to the relevant underlying information in sufficient detail to make such adjustments with certainty. Restating the financial statements of an overseas associate to FRS 102 may require extensive detailed information that might not be required under the associate's local GAAP (for example, in respect of business combinations, share-based payments, financial instruments and revenue recognition).

3.2.2.D Implicit goodwill and fair value adjustments

Section 14 states that on acquisition of an investment in an associate, any difference between the cost of acquisition and the investor's share of the net fair values of the investee's identifiable assets and liabilities are to be accounted for in accordance with Section 19 as implicit goodwill (see Chapter 22 at 3.9), as follows: *[FRS 102.14.8(c)]*

- Any goodwill relating to an associate is included in the carrying amount of the investment. After initial recognition, the acquirer measures goodwill included in the carrying amount of the investment at cost less accumulated amortisation (but not impairment, see 3.2.2.I below). Goodwill is considered to have a finite useful life and must be amortised on a systematic basis over its life. If, in exceptional cases, an entity is unable to make a reliable estimate of the useful life of goodwill, the life must not exceed 10 years. Any amortisation is recognised against the investor's share of the associate's profit or loss. *[FRS 102.19.23]*
- If the acquirer's interest in the net amount of the associate's identifiable assets, liabilities and provisions for contingent liabilities exceeds the cost of the investment (also referred to as negative goodwill), the acquirer must (after reassessing the identification and measurement of the acquiree's assets and liabilities and the measurement of the cost of the combination) recognise the excess up to the fair value of the non-monetary assets acquired in the associate's profit or loss in the periods in which the non-monetary assets are recovered. Any excess exceeding the fair value of the non-monetary assets acquired is recognised in profit or loss in the periods expected to be benefited (see Chapter 22 at 3.9.3). *[FRS 102.19.24]*.

Section 14 also states that an investor adjusts its share of the associate's profits or losses after acquisition in order to account, for example, for additional depreciation or amortisation of the depreciable assets or amortisable assets (including goodwill) on the basis of the excess of their fair values over their carrying amounts at the time the investment was acquired. *[FRS 102.14.8(c)]*.

3.2.2.E Potential voting rights and share of the investee

In applying the equity method, the proportionate share of the associate to be accounted for, in many cases, will be based on the investor's ownership interest in the ordinary shares of the investee.

Although potential voting rights need to be considered in determining whether significant influence exists (see 3.1.2.D above) an investor measures its share of profit or loss and other comprehensive income of the associate as well as its share of changes in the associate's equity based on present ownership interests.

Those measurements do not reflect the possible exercise or conversion of potential voting rights.

[FRS 102.14.8(b)].

If an associate has outstanding cumulative preference shares that are held by parties other than the investor and that are classified as equity, the investor computes its share of profits or losses after adjusting for the dividends on such shares, whether or not the dividends have been declared.

Illustration 3-2: Cumulative preference shares issued by an associate

An entity holds an investment of 30% in the ordinary shares of an associate that has net assets of £200,000 and net profit for the year of £24,500. The associate has issued 5,000 cumulative preference shares with a nominal value of £10 which entitle its holders to a 9% cumulative preference dividend. The cumulative preference shares are classified by the associate as equity in accordance with the requirements of Section 22 *Liabilities and Equity*. The associate has not declared dividends on the cumulative preference shares in the past two years.

The investor calculates its share of the associate's net assets and net profit as follows:

	£
Net assets	200,000
9% Cumulative preference shares	(50,000)
Undeclared dividend on cumulative preference shares 2 years × 9% × £50,000 =	(9,000)
Net assets value attributable to ordinary shareholders	<u>141,000</u>
Investor's 30% share of the net assets	<u>42,300</u>
Net profit for the year	24,500
Share of profit of holders of cumulative preference shares 9% of £50,000 =	(4,500)
Net profit attributable to ordinary shareholders	<u>20,000</u>
Investor's 30% share of the net profit	<u>6,000</u>

If the investor also owned all of the cumulative preference shares, it would assess whether those preference shares are accounted for under the equity method or as a long-term interest. If accounted for using the equity method, its share in the net assets of the associate would be £42,300 + £50,000 + £9,000 = £101,300. Its share in the net profit would be £6,000 + £4,500 = £10,500.

When an associate has a complicated equity structure with several classes of equity shares that have varying entitlements to net profits and equity, the investor needs to assess carefully the rights attaching to each class of equity share in determining the appropriate % of ownership interest.

An investor that holds ordinary shares in an entity which also has preference shares where the preference shareholders are entitled to a cumulative dividend on the net profits and have a liquidation preference in respect of the nominal value of the shares will need to carefully assess what its appropriate share in the profits and equity of that entity are. The investor would take the liquidation preference into account in calculating its interest in the associate or joint venture to the extent that there is economic substance to that right.

Section 14 does not address the situation of a group, in which the parent and its subsidiaries hold shares in the associate. However, based on the requirements of IAS 28, a group's share in an associate is the aggregate of the holdings in that associate by the parent and its subsidiaries. Holdings in the associate by the group's other associates or joint ventures are ignored for this purpose. [IAS 28.27].

Illustration 3-3: Share in an associate

Parent A holds a 100% investment in Subsidiary B, which in turn holds a 25% investment in Associate Z. In addition, Parent A also holds a 30% investment in Associate C and a 50% investment in Joint Venture D, each of which holds a 10% investment in Associate Z.

In its consolidated financial statements Parent A accounts for a 25% investment in Associate Z under the equity method because:

- The investments in associate Z held by associate C and joint venture D are not taken into account.
- Parent A consolidates the assets of Subsidiary B, which include a 25% investment in Associate Z.

Section 14 does not address the situation where an associate itself has subsidiaries, associates or jointly controlled entities. However, based on the CA 2006 and the requirements of IAS 28, the profits or losses, other comprehensive income and net assets taken into account when the investor applies the equity method are those recognised in the associate's consolidated financial statements, but after any adjustments necessary to give effect to uniform accounting policies (see 3.2.2.C above). [6 Sch 21(2), IAS 28.27].

It may be that the associate does not own all the shares in some of its subsidiaries, in which case its consolidated financial statements will include non-controlling interests. Under the CA 2006, any non-controlling interests are presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent. Profit or loss and each component of other comprehensive income are attributed to the owners of the parent and to the non-controlling interests. [FRS 102.6.3(a)].

The profit or loss and other comprehensive income reported in the associate's consolidated financial statements will include 100% of the amounts relating to the subsidiaries, but the overall profit or loss and total comprehensive income will be split between the amounts attributable to the owners of the parent (i.e., the associate) and those attributable to the non-controlling interests. The net assets in the associate's consolidated statement of financial position will also include 100% of the amounts relating to the subsidiaries, with any non-controlling interests in the net assets presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent.

Section 14 does not address whether the investor's share, for equity accounting purposes, of the associate's profits, other comprehensive income and net assets must be based on the amounts before or after any non-controlling interests in the associate's consolidated financial statements. However, as the investor's interest in the associate is as an owner of that associate (which is itself a parent), it is appropriate that the share is based on the profit or loss, other comprehensive income and equity (net assets) that are reported as being attributable to the owners of the parent in the associate's consolidated financial statements, i.e., after any amounts attributable to the non-controlling interests.

How we see it

In our view, when an investee does not wholly own its subsidiaries, since the investor's interest in the associate is as an owner of the parent, its share of its associate's or joint venture's profits is based on the amounts that are reported as attributable to the owners of the parent (controlling interest) in the associate's consolidated financial statements, i.e., after any amounts attributable to the NCI.

3.2.2.F Distributions and other adjustments to carrying amount

Distributions received from an associate reduce the carrying amount of the investment. Adjustments to the carrying amount may also be necessary due to changes in the associate's equity from items of its other comprehensive income. [FRS 102.14.8(a)].

Such changes could include those arising from the revaluation of property, plant and equipment and from foreign exchange translation differences. The investor's share of the investee's other comprehensive income is recognised in the investor's statement of comprehensive income. [FRS 102.5.5A]. Distributions received in excess of the carrying amount of the associate are dealt with at 3.3.2 below.

3.2.2.G Investor's transactions with associates

Section 14 requires unrealised profits and losses resulting from what it refers to as 'upstream' (associate to investor) and 'downstream' (investor to associate) transactions between an investor (including its consolidated subsidiaries) and an associate to be eliminated from the investor's financial statements to the extent of investor's interest in the associate. Unrealised losses on such transactions may provide evidence of an impairment of the asset transferred. [FRS 102.14.8(e)].

'Upstream' transactions are, for example, sales of assets from an associate to the investor. 'Downstream' transactions are, for example, sales or contributions of assets from the investor to its associate.

Section 14 provides no further guidance as to how this broadly expressed requirement translates into accounting entries.

How we see it

We believe that an appropriate approach for presenting these entries is as follows:

- In the income statement, the adjustment is taken against either the investor's profit or the share of the associate's profit, according to whether the investor or the associate recorded the profit on the transaction, respectively.
- In the statement of financial position:
 - If the asset subject to the transaction is held by the associate, the adjustment is made against the carrying amount for the associate (see Illustration 3-6 below).
 - Or
 - If the asset subject to the transaction is held by the investor, entities have an accounting policy choice as to where the adjustment is made. It is acceptable to make the adjustment either against the carrying amount of the associate or against the asset which was the subject of the transaction. This latter approach is shown in Illustration 3-7 below.

Illustration 3-6 and Illustration 3-7 below show the adjustment against the asset which is the subject of the transaction. Both Illustrations deal with the reporting Entity H and its 40% Associate A. The journal entries are based on the premise that H's financial statements are initially prepared as a simple aggregation of H and the relevant share of its associate. The entries below would then be applied to the numbers at that stage of the process.

Illustration 3-4: Elimination of profit on sale by investor to associate ('downstream transaction')

One month before its reporting date, Entity H sells inventory costing £750,000 to Associate A for £1 million, all of which remains in A's inventory at the reporting date.

H recorded revenue of £1 million and cost of sales of £750,000. However since, at the reporting date, the inventory is still held by A, only 60% of this transaction is regarded by FRS 102 as having taken place (in effect with the other shareholders of A). This is reflected by the elimination accounting entry:

	£	£
Dr Revenue	400,000	
Cr Cost of sales		300,000
Cr Investment in A		100,000

This entry effectively defers recognition of 40% of the profit on sale (£250,000 x 40%) and offsets the deferred profit against the carrying amount of H's investment in A.

After the reporting date, when the inventory is sold to a third party for £1.2 million, this deferred profit can be released by H, reflected by the following equity accounting entry:

	£	£
Dr Investment in A	100,000	
Dr Cost of sales	300,000	
Cr Revenue		400,000

An alternative approach would be to eliminate the profit on 40% of the sale against the cost of sales. Before the reporting date, this is reflected by the equity accounting entry:

	£	£
Dr Cost of sales	100,000	
Cr Investment in A		100,000

After the reporting date, when the inventory is sold to a third party for £1.2m by A, this deferred profit can be released by H, reflected by the following equity accounting entry:

	£	£
Dr Investment in A	100,000	
Cr Cost of sales		100,000

An argument in favour of the alternative approach is that the revenue figures are not adjusted because the sales to associates are disclosed as related party transactions. However, this approach causes volatility in H's reported gross margin as revenue and the related net margin are not recognised in the same accounting period.

Illustration 3-5: Elimination of profit on sale by associate to reporting entity ('upstream transaction')

This is the mirror image of the transaction in Illustration 3-6 above. Before H's reporting date, A sells inventory costing £750,000 to H for £1 million.

A recognised a profit of £250,000 (£1 million - £750,000), 40% of which (£100,000) is regarded under FRS 102 as unrealised by H, and is therefore deferred and offset against inventory:

	£	£
Dr Equity method earnings in A	100,000	
Cr Inventory		100,000

In the following period, when the inventory is sold to a third party for £1.2 million by H, the entry is reversed:

	£	£
Dr Inventory	100,000	
Cr Equity method earnings in A		100,000

Under this approach, at the reporting date, the investment in A will have increased by £100,000 more than the share of profit of associates as reported in the group profit or loss (and in the following period by £100,000 less). This is because the adjustment to the statement of financial position at the reporting date is to inventory rather than the carrying value of the investment in A, reflecting the fact that A has, indeed, made a profit. It might therefore be necessary to disclose the reasons for this difference in the notes to the financial statements.

Note that unrealised losses on upstream and downstream transactions might provide evidence of an impairment in the asset transferred. [FRS 102.14.8(e)].

The effect of these requirements is illustrated in Illustration 3-8 and Illustration 3-9 below.

Illustration 3-6: Sale of asset from an investor to associate at a loss

Entity A holds 40% of Entity B, giving it significant influence. B acquires a property from A for £8 million cash and the property was recorded in the financial statements of A at £10 million. £8 million is agreed to be the fair market value of the property. How must A account for these transactions?

The required accounting entry by A is as follows:

	£m	£m
Dr Cash ⁽¹⁾	8	
Dr Loss on sale ⁽²⁾	2	
Cr Property ⁽³⁾		10

(1) £8 million received from B.

(2) Loss on sale of property £2 million (£8 million received from B less £10 million carrying value = £2 million) not adjusted since the transaction indicated an impairment of the property. In effect, it is the result that would have been obtained if A had recognised an impairment charge immediately prior to the sale and then recognised no gain or loss on the sale.

(3) Derecognition of A's original property

Illustration 3-7: Sale of asset from associate to an investor at a loss

Entity A holds 40% of Entity B giving it significant influence. B acquires a property for £8 million from an independent third-party C. The property is then sold to A for £7 million, which is agreed to be its market value. How must A account for these transactions?

The required accounting entry by A is as follows:

	£m	£m
Dr Property ⁽¹⁾	7.0	
Dr Share of loss of B ⁽²⁾	0.4	
Cr Investment in B		0.4
Cr Cash ⁽³⁾		7.0

(1) £7 million paid to B not adjusted since the transaction indicated an impairment of B's asset.

(2) Loss in B's books is £1 million (£8 million cost of property less £7 million proceeds of sale). A recognises its 40% share because the transaction indicates an impairment of the asset. In effect, it is the result that would have been obtained if B had recognised an impairment charge immediately prior to the sale and then recognised no gain or loss on the sale.

(3) £7 million consideration for the property.

Elimination of 'downstream' unrealised profits in excess of the investment

Occasionally an investor's share of the unrealised profit on the sale of an asset to an associate exceeds the carrying value of the investment held. In that case, to what extent is any profit in excess of the carrying value of the investment eliminated?

Section 14 provides no guidance on the elimination of 'downstream' unrealised gains in excess of the investment.

How we see it

in our view, an investor needs to determine an appropriate policy for dealing with the elimination of excess downstream unrealised gains. We believe the investor could either recognise the excess as 'deferred income' or restrict the elimination to the amount required to reduce the investment to zero. The treatment chosen is based on the investor's accounting policy choice for dealing with other situations when Section 14 is unclear, reflecting whether the investor considers the equity method of accounting to be primarily a method of consolidation (which would be consistent with recognition of the excess as deferred income) or a method of valuing an investment (which would be consistent with restricting the elimination to the amount that reduces the investment to zero). The investor applies a consistent policy to such situations.

Loans and borrowings between the reporting entity and its associates

The requirement in Section 14 to eliminate partially unrealised profits or losses on transactions with associates is expressed in terms of transactions involving the transfer of assets. The requirement for partial elimination of profits could be read to not apply to items such as interest paid on loans and borrowings between the reporting entity and its associates, since such loans and borrowings do not involve the transfer of assets giving rise to gains or losses. Moreover, they are not normally regarded as part of the investor's share of the net assets of the associate, but as separate transactions (except in the case of loss-making associates, where interests in long-term loans and borrowings may be required to be accounted for as if they were part of the reporting entity's equity investment in determining the carrying value of the associate against which losses may be offset, see 3.3.2.H below).

How we see it

We believe that loans and borrowings between the reporting entity and its associates generally are not eliminated in the reporting entity's consolidated financial statements when the interest income and expense are recognised by both parties.

However, if the associate has capitalised the borrowing costs, then the investor would need to eliminate a relevant share of its interest income and realise it as the associate depreciates the qualifying asset. The same principle applies to eliminate a share of capitalised management or advisory fees charged to an associate.

Cash flow statement

FRS 102 is silent on how cash flows relating to transactions with an associate must be presented in the consolidated cash flow statement. It is generally accepted that no adjustment must be made in respect of these cash flows, as the associate is not a member of the group and hence is not subject to the requirements on elimination of intragroup transactions as set out in Section 9. [FRS 102.9.15]. This contrasts with the requirement, in any consolidated statement of cash flows, to eliminate the cash flows between members of the group in the same way that intragroup transactions are eliminated in the profit and loss account and statement of financial position.

3.2.2.H Losses in excess of investment

An investor in an associate recognises its share of the losses of the associate until its share of losses equals or exceeds the carrying amount of its interest in the associate, at which point the investor discontinues recognising its share of further losses. [FRS 102.14.8(h)].

Once the investor's interest is reduced to zero, additional losses are provided for, and a liability is recognised in accordance with Section 21 *Provisions and Contingencies* (see Chapter 24), only to the extent that the investor has incurred legal or constructive obligations or made payments on behalf of the associate. If the associate subsequently reports profits, the investor resumes recognising its share of those profits only after its share of the profits equals the share of losses not recognised. [FRS 102.14.8(h)]. Practically, an entity needs to track the off balance sheet losses of its associates in order to calculate subsequent income to be recognised from that associate.

In addition to the recognition of losses arising from application of the equity method, an investor in an associate must consider the requirements of Section 27 *Impairment of Assets* in respect of impairment losses. An investor also needs to consider Section 11 *Basic Financial Instruments* in order to determine whether it is necessary to recognise any additional impairment loss with respect to that part of the investor's interest in the associate that does not comprise its net investment in the associate (see 3.2.2.I below).

Section 14 states that the interest in an associate is the carrying amount of the investment determined using the equity method together with any financial instruments that in substance form part of the investor's net investment in the associate. For example, an item for which settlement is neither planned nor likely to occur in the foreseeable future might be regarded as being, in substance, an extension of the entity's investment in that associate. An investor would need to consider whether these interests are recoverable in accordance with Section 27. Examples of such financial instruments include:

- Preference shares
- Long-term receivables or loans (unless supported by adequate collateral)
- But do not include:
- Trade receivables
- Trade payables
- Any long-term receivables for which adequate collateral exists, such as secured loans. [FRS 102.14.8(h), FRS 102.14.8A].

Illustration 3-8: Accounting for a loss-making associate

At the beginning of the year entity H invests £5 million to acquire a 30% equity interest in Associate A. In addition, H lends £9 million to A, but does not provide any guarantees or commit itself to provide further funding. How must H account for the £20 million loss that A made during the year?

H's share in A's loss is £20 million $\times$ 30% = £6 million. If H's loan to A is considered part of the net investment in the A then the carrying amount of the associate is reduced by £6 million, from £14 million (= £5 million + £9 million) to £8 million. That is, the equity interest is reduced to nil and the loan is reduced to £8 million.

Conversely, if the loan is not part of the net investment in A, then H accounts for the loss as follows:

- The equity interest in the associate is reduced from £5 million to zero.
- A loss of £1 million remains unrecognised because H did not provide any guarantees and has no commitments to provide further funding.
- If in the second year, A were to make a profit of £10 million then H would recognise a profit of £2 million (= £10 million $\times$ 30% - £1 million).
- Alternatively, if, in the second year H were to provide a £1.5 million guarantee to A and A's net profit were nil, then H would need to recognise an immediate loss of £1 million (i.e., the lower of the unrecognised loss of £1 million and the guarantee of £1.5 million) because it now has a legal obligation in respect of A's debts.
- As there are several indicators of impairment, the loan from H to A is tested for impairment in accordance with Section 11.

3.2.2.1 Impairment

An entity tests the carrying value of its investment in an associate for impairment only if an event has occurred that indicates that it will not recover the carrying value. [FRS 102.27.7].

Determining whether an investment in an associate is impaired may be more complicated because it involves carrying out several separate impairment assessments:

- Underlying assets of the associate
It is generally not appropriate for the investor simply to multiply the amount of the impairment charge recognised in the investee's own books by the investor's % of ownership when recognising its share of the investee's profit or loss. This is because the investor measures its interest in an associate's identifiable net assets at fair value at the date of acquisition of an associate (see 3.2.2.D above). Therefore, if the value that the investor attributes to the associate's net assets differs from the carrying amount of those net assets in the associate's own books, the investor adjusts any impairment losses recognised by the associate for the effect of those fair value differences.
Any goodwill recognised by an associate, needs to be separated into two elements.
 - Goodwill that existed at the date the investor acquired its interest in the associate.
 - And
 - Goodwill that arises on subsequent acquisitions by the associate or joint venture.
 - Goodwill that existed at the date investor acquired its interest is not an identifiable asset of the associate from the perspective of the investor. It is combined with the investor's goodwill on the acquisition of its interest in the associate.
Goodwill that arises on subsequent acquisitions by the associate is accounted for as such in the books of the associate and tested for impairment in accordance with Section 27 by the associate. The investor does not make any adjustments to the associate's accounting for that goodwill.
- Investment in the associate
As well as reflecting any impairment in the underlying assets of the associate using the equity method as discussed above, Section 14 requires an investor to test the entire carrying amount of the interest, including financial instruments that in substance form part of the investor's net investment in the associate, for impairment as a single asset in accordance with Section 27. Any goodwill included as part of the carrying amount of the investment in the associate is not tested separately for impairment but is tested as part of the overall investment as a whole. [FRS 102.14.8A].

- Other interests that are not part of the equity interest in the associate

The investor must also apply Section 11 in order to determine whether it is necessary to recognise any additional impairment loss with respect to that part of the investor's interest in the associate that does not comprise its net investment in the associate. This could include, for example, trade receivables and payables, and collateralised long-term receivables, but might also include preference shares or loans (see 3.3.2.H above). In this case, however, the impairment is calculated in accordance with Section 11, and not Section 27.

How we see it

It is unlikely that any impairment charge recognised in respect of an associate will simply be the investor's share of any impairment charge recognised by the associate itself, even when the associate complies with FRS 102, considering the factors described above.

When the carrying amount of an investment in an associate is tested for impairment in accordance with Section 27, an impairment loss is recognised against the entire investment and is not allocated to any individual asset, including goodwill, which forms part of the carrying amount of the associate. In addition, any reversal of that impairment loss is recognised to the extent that the recoverable amount of the investment exceeds the carrying amount, subject to the reversal not exceeding the carrying amount that would have been determined had no impairment loss been recognised in previous years. [FRS 102.27.30, FRS 102.14.8A].

Illustration 3-9: Impairment losses recognised by an associate

Investor A acquires a 25% equity interest in Associate B. The cost of the investment was £95,000 including transaction costs. To simplify this Illustration, assume that the only assets held by B are PP&E and there is no equity method goodwill. At the acquisition date, the fair value of the PP&E is £380,000 and A's share of this is £95,000 (25% of £380,000). On that date, the carrying value of the PP&E of B is £300,000 and A's share of this is £75,000 (25% of £300,000). The £20,000 difference between A's cost of £95,000 and its share of the carrying value of net assets of B of £75,000 relates entirely to the fair value uplift of the PP&E. Depreciation, transactions between A and B and the effect of income taxes have been ignored to simplify this example.

	B's carrying value	A's 25% share of B's carrying value	Fair value of B's net assets	Difference between carrying value and fair value (basis difference)	A's 25% of basis difference
	£'000	£'000	£'000	£'000	£'000
PP&E	300	75	380	80	20

Subsequently, B determines that the PP&E is impaired and the recoverable amount of the PP&E at the date of impairment is £280,000. Therefore, B recognises an impairment charge of £20,000 to reduce the carrying value of the PP&E to its recoverable amount. A's share of the revised carrying value of the PP&E is £70,000 (25% of £280,000).

In the ordinary course of recording its share of B's profits under the equity method, A records its share of the impairment charge £5,000 (25% of £20,000). That is, the impairment charge recorded by B is included in its profit or loss, which is the basis for A to determine its share of B's profits.

In addition, A assesses the effect of the impairment on the fair value adjustment recorded on acquisition of its investment in B. Because A's share of the fixed assets of £90,000 (£95,000 less the impairment charge of £5,000) exceeds its share of the recoverable amount of the PP&E (£70,000), A recognises an additional impairment charge of £20,000. Therefore, the total impairment charge recognised by A is £25,000 (£5,000 that was included in A's share of B's profit plus £20,000 additional loss related to the fair value adjustment). While A does not assess individual underlying assets for impairment, when B recognises an impairment, A adjusts the impairment charge to reflect its share in the underlying assets. After recording the impairment charge, A's share in the PP&E of B is as follows:

	B's carrying value (after impairment)	A's 25% share of B's carrying value	Fair value of B's net assets	Difference between carrying value and fair value (basis difference)	A's 25% of basis difference
	£'000	£'000	£'000	£'000	£'000
PP&E (after impairment)	280	70	280	-	-
					£'000
Cost of original 25% equity method investment					95
A's equity method loss from B (25% of £20,000)					(5)
Additional equity method loss for impairment [(£95,000 - £5000) - (25% of £280,000)]					(20)
A's equity method carrying amount of B					70

3.2.2.J Discontinuing the equity method

An investor discontinues the use of the equity method from the date that significant influence ceases. The subsequent accounting depends upon the nature of the retained investment.

If the associate becomes a subsidiary (because control is obtained), it will be accounted for in accordance with Section 19 (i.e., a step-acquisition, see Chapter 22 at 2.10).

If an investment in an associate becomes an investment in a joint venture it will account for its investment in accordance with Section 15 *Investments in Joint Ventures* (i.e., it will continue to be accounted for under the equity method, see Chapter 18).

Otherwise, the retained investment is accounted for as a financial asset in accordance with Section 11 or Section 12 *Other Financial Instruments* as discussed below. [FRS 102.14.8(i)].

If an investor disposes of some or all of its investment, such that it no longer has significant influence over the investee, it will discontinue the use of the equity method. In such situations, the entity derecognises the associate and recognises in profit or loss any difference between the:

- The proceeds from the disposal.
- And
- The carrying amount of the investment in the associate relating to the proportion disposed of or lost at the date significant influence is lost. [FRS 102.14.8(i)(i)].

The investor accounts for any retained interest as a financial asset in accordance with Section 11 or Section 12 as appropriate. The carrying amount of the proportion retained in the investment at the date that it ceases to be an associate is regarded as its cost on initial measurement as a financial asset.

Where an investor ceases to have significant influence due to a change in circumstances other than by partial disposal, for example, as a result of changes to the board of directors or equivalent governing body of the associate that results in a loss of significant influence, the investor will discontinue the use of the equity method. In that case, the investor does not recognise a profit or loss but regards the carrying amount of the investment at that date as the new cost basis in accordance with Sections 11 or 12.

[FRS 102.14.8(i)(ii)].

If an investor loses significant influence as a result of a disposal, the gain or loss arising on that disposal includes amounts recognised in other comprehensive income in relation to that associate where those amounts are required to be reclassified to profit or loss on disposal. [FRS 102.14.8(i)]. Under FRS 102 this includes cash flow hedges which have not yet been reclassified to profit or loss. Amounts that are not required to be reclassified to profit or loss upon disposal are transferred directly to retained earnings.

[FRS 102.14.8(i)].

A deemed disposal, for example, where the associate has issued shares to a new investor, is accounted for as a regular disposal and hence a profit or loss is recognised as set out above. The original investor considers whether any profit resulting from the transaction is realised or unrealised. If unrealised, it is taken to other comprehensive income and not to profit or loss.

3.2.2.K Transactions to create an associate

An investor may exchange a business, or other non-monetary asset, for an interest in another entity, and that other entity becomes an associate of the investor. Questions arise regarding the use of fair values or previous carrying values and reporting any gain on the transaction.

The requirements in respect of such transactions are set out in Section 9 (see Chapter 8 at 3.8).

[FRS 102.9.31]. Fair values are used except in rare circumstances where the transaction is artificial and has no substance. Any unrealised gains are not reported in profit or loss.

Accordingly, the following accounting treatment is applied in the consolidated financial statements of the investor:

- The retained interest in the assets exchanged is not remeasured and included at its pre-transaction carrying amount. The investor retains an ownership interest in the business or other non-monetary assets exchanged, held through the associate. That retained interest, including any related goodwill, is treated as having been owned by the investor throughout the transaction and included at its pre-transaction carrying amount.
- Goodwill is recognised as the difference between:
 - The fair value of the consideration given.
 - And
 - The fair value of the investor's share of the pre-transaction identifiable net assets of the associate.

The consideration given for the interest acquired in the associate includes that part of the business or other non-monetary assets exchanged and no longer owned by the investor, i.e., the part effectively sold to the other investors in the associate. The consideration might also include cash or monetary assets to achieve equalisation of values. For example, where all investing parties in the associate have contributed assets of values not precisely commensurate with each party's ultimate ownership interest in the associate. When it is difficult to value the consideration given, the best estimate of its value may be obtained by valuing what is acquired.

- To the extent that the fair value of the consideration received by the investor exceeds the carrying value of assets given up, the investor recognises a gain. The assets given up include the part of the business or other non-monetary assets exchanged and no longer owned by the investor, as well as any related goodwill and cash transferred. Any unrealised gain arising on the exchange is recognised in other comprehensive income.
- And
- To the extent that the fair value of the consideration received by the investor is less than the carrying value of assets given up, the investor recognises a loss. The assets given up include the part of the business or other non-monetary assets exchanged and no longer owned by the investor, as well as any related goodwill and cash transferred. The loss is recognised either as an impairment in accordance with Section 27 (i.e., in other comprehensive income or profit and loss as appropriate) or, for any loss remaining after an impairment review of the relevant assets, in profit or loss. [FRS 102.9.31].

The most common situation for these transactions in practice is the contribution of a business for equity in an associate (or joint venture). Examples 3-7 and 3-8 in Chapter 18 illustrate the required accounting for such transactions.

Section 9 does not explain how a realised gain can be distinguished from an unrealised gain. Example 3-7 in Chapter 18 adopts a 'top slicing' approach whereby as much of the total gain as is backed by cash is treated as realised (i.e., £10m). 'Top slicing' is the recommended approach in determining realised profits for exchanges of assets in paragraph 3.18 of the ICAEW/ICAS TECH 02/17BL *Guidance on Realised and Distributable Profits under the Companies Act 2006*. Paragraph 3.18A of the guidance states that when the consideration received comprises a combination of assets and liabilities, the profit will be realised only to the extent of any net balance (i.e., cash less liabilities) of qualifying consideration received.

No gain or loss is recognised in those rare cases where the transaction is artificial or lacks substance. In that case, a gain or loss on the exchange is not justified. In these circumstances, disclosure is required. [FRS 102.9.32]. The standard gives no example of when a transaction is artificial or lacks substance.

3.2.3 Cost model

An investor that is not a parent that adopts the cost model measures its investments in associates at cost less any accumulated impairment losses. Section 27 applies to the recognition and measurement of impairment losses. [FRS 102.14.5].

Section 14 does not define 'cost' of investment. However, Section 2 *Concepts and Pervasive Principles* defines 'historical cost' as the value of costs incurred in acquiring or creating the asset, comprising the consideration paid to acquire or create the asset plus transaction costs. [FRS 102.2.69]. The Regulations state that the purchase price of an asset is determined by adding to the actual price paid any expenses incidental to its acquisition and then subtracting any incidental reductions in the cost of the acquisition. [1 Sch 27(1)]. Consistent with this, Section 17 *Property, Plant and Equipment*, states that cost is normally either the purchase price paid (including directly attributable costs) or the fair value of non-monetary assets exchanged. [FRS 102.17.10, FRS 102.17.14]. The purchase price would generally represent the fair value of the consideration given to purchase the investment consistent with the guidance in respect of exchanges of businesses or other non-monetary items assets (see Chapter 8 at 3.8) and the requirements in respect of measuring the cost of a business combination (see Chapter 22 at 3.6).

An investor will recognise distributions received from its investments in associates as income irrespective of whether the distributions are from accumulated profits of the associate arising before or after the date of acquisition. [FRS 102.14.6].

3.2.4 Fair value model

An investor that is not a parent that accounts for its associate at fair value through other comprehensive income, initially recognises its investment at the transaction price. [FRS 102.14.9]. 'Transaction price' is not defined but is considered to be the same as its cost.

At each subsequent reporting date, the investor measures its investments in associates at fair value using the fair value guidance in Section 2A *Fair Value Measurement*. [FRS.102.14.10].

When the fair value through other comprehensive income model is used, increases in the carrying amount as a result of a revaluation to fair value are recognised in other comprehensive income and accumulated in equity, i.e., a revaluation reserve. However, if a revaluation increase reverses a previous revaluation decrease of the same investment that was recognised as an expense, it is recognised in profit or loss. [FRS 102.17.15E]. Decreases as a result of revaluation are recognised in other comprehensive income to the extent of any previously recognised revaluation increase accumulated in revaluation reserve in respect of the same investment. If a revaluation decrease exceeds the revaluation gains accumulated in revaluation reserve in respect of that investment, the excess is recognised in profit or loss. [FRS 102.17.15F]. This means that it is not permissible to carry a negative revaluation reserve in respect of each investment in associate carried at fair value.

An investor recognises distributions received from its investments in associates accounted for at fair value through other comprehensive income as income irrespective of whether the distributions are from accumulated profits of the associate arising before or after the date of acquisition. [FRS 102.14.10A].

When the fair value through profit or loss model is used, increases and decreases in the carrying amount of the investment as a result of a revaluation to fair value are recognised in profit or loss.

3.3 Practical Issues

3.3.1 Changes in ownership interest

3.3.1.A Initial carrying amount of an associate following loss of control of an entity

Under Section 9, when a parent loses control of a subsidiary and retains an interest in it, that retained interest is measured at the carrying amount of the net assets (and goodwill) attributable to the investment at the date that the entity ceases to be a subsidiary. That carrying amount is regarded as the cost on initial measurement of the financial asset or investment in the associate, as appropriate. In applying the equity method to a retained investment in an associate, there is no need to determine the implicit goodwill and fair values of the associate's assets and liabilities at the date it becomes an associate. [FRS 102.9.19].

Illustration 3-10: Accounting for retained interest in an associate following loss of control of an entity

Entity A owns 100% of the shares of Entity B. The interest was originally purchased for £500,000 and £40,000 of directly attributable costs relating to the acquisition were incurred. During the year, Entity A sells 60% of the shares to Entity C for £1,300,000. As a result of the sale, Entity C obtains control over Entity B. Entity A determines that its 40% interest gives it significant influence over Entity B.

At the date of disposal, the carrying amount of the net assets of Entity B in Entity A's consolidated financial statements is £1,200,000 and there is also goodwill of £200,000 relating to the acquisition of Entity B. The fair value of the identifiable assets and liabilities of Entity B is £1,600,000. The fair value of Entity A's retained interest of 40% of the shares of Entity B is £800,000.

Upon Entity A's sale of 60% of the shares of Entity B, it deconsolidates Entity B and accounts for its investment in Entity B as an associate using the equity method of accounting.

Entity A's initial carrying amount of the associate is based on the carrying value of the net assets (and goodwill) of the retained interest, i.e., £560,000 or 40% of the carrying amount of the net assets and goodwill totalling £1,400,000.

3.3.1.B Piecemeal acquisition of an associate

There is no guidance in FRS 102 on how to account for the piecemeal acquisition of an associate and so different approaches could be applied in practice.

Existing investment becomes an associate

An entity may gain significant influence over an existing investment upon acquisition of a further interest or due to a change in circumstances. Section 14 gives no guidance on how an investor must account for an existing investment that subsequently becomes an associate.

It is clear under Section 19 that in a business combination where control over an acquiree is achieved in stages following a series of transactions, the cost of the business combination is the aggregate of the fair values of the assets given, liabilities assumed and equity instruments issued by the acquirer at the date of each transaction in the series. [FRS 102.19.11A]. It might be argued that a similar approach should be adopted when an associate is acquired in stages.

3.3.1.C Step increase in existing associate

An entity may acquire an additional interest in an existing associate that continues to be an associate accounted for under the equity method. FRS 102 does not explicitly deal with such transactions.

How we see it

When an investor acquires an additional interest in an existing associate that continues to be accounted for under the equity method, we believe that the purchase price paid for the additional interest is added to the existing carrying amount of the associate and the existing interest in the associate or joint venture is not remeasured.

This increase in the investment is still notionally split between goodwill and the additional interest in the fair value of the net assets of the associate. This split is based on the fair value of the net assets at the date of the increase in the associate. However, no remeasurement is made for previously unrecognised changes in the fair values of identifiable net assets.

Paragraph 14.8(c) of FRS 102 establishes the requirement that the cost of an investment in an associate is allocated between the purchase of a share of the fair value of net assets and the goodwill. This requirement is not limited to the initial application of equity accounting but applies to each acquisition of an investment. However, this does not result in any revaluation of the existing share of net assets.

Rather, the existing ownership interests are accounted for under paragraph 14.8 of FRS 102, whereby the carrying value is adjusted only for the investor's share of the associate's profits or losses and other recognised equity transactions. No entry is recognised to reflect changes in the fair value of assets and liabilities that are not recognised under the accounting policies applied for the associate.

Illustration 3-11 below illustrates an increase in ownership of an associate that continues to be an associate.

Illustration 3-11: Accounting for an increase in the ownership of an associate

Entity A obtains significant influence over Entity B by acquiring an investment of 25% at a cost of £3,000. At the date of the acquisition, the fair value of the associate's net identifiable assets is £10,000, which equals their carrying amounts. Therefore, the difference between the amount paid of £3,000 and A's share of the fair value of B's net assets of £2,500 is attributable entirely to goodwill. The investment is accounted for under the equity method in the consolidated financial statements of A.

Two years later, Entity A acquires an additional investment of 20% in Entity B at a cost of £4,000, increasing its total investment in Entity B to 45%. The investment is still an associate and accounted for using the equity method of accounting.

For the purposes of the example, directly attributable costs have been ignored and it is assumed that no profit or loss arose during the period since the acquisition of the first 25%. The implicit goodwill on the initial acquisition of the associate of £500 is assumed to have a 10 year useful life, therefore goodwill amortisation of £100 has been recognised over the two year period between the initial investment of 25% and the purchase of the additional interest of 20%. Therefore, the carrying amount of the investment immediately prior to the additional investment is £2,900 (£3,000 - £100). However, an asset held by the associate has increased in value by £5,000 so that the fair value of the associate's net identifiable assets is now £15,000.

To summarise, amounts are as follows:

	£
Fair value of net assets of Entity B at acquisition	10,000
Increase in fair value	<u>5,000</u>
Fair value of net assets of Entity B two years later	<u>15,000</u>

Because of the additional investment, the equity-accounted amount for the associate increases by £4,000. The notional goodwill applicable to the second tranche of the acquisition is £1,000 [$£4,000 - (20\% \times £15,000)$].

The impact of the additional investment on Entity A's equity-accounted amount for Entity B is summarised as follows:

	% held	Carrying amount	Share of net assets	Goodwill included in investment
		£	£	£
Existing investment	25	2,900	2,500	400
Additional investment	<u>20</u>	<u>4,000</u>	<u>3,000</u>	<u>1,000</u>
Total investment	<u>45</u>	<u>6,900</u>	<u>5,500</u>	<u>1,400</u>

The accounting described above applies when the additional interest in an existing associate continues to be accounted for as an associate under the equity method. The accounting for an increase in an associate that becomes a subsidiary is discussed in Chapter 22.

3.3.1.D Step increase in existing associate that becomes a joint venture

In the situation discussed at 3.3.1.C above, the acquisition of the additional interest did not result in a change in status of the investee, i.e., the associate remained an associate. However, an entity might acquire an additional interest in an existing associate that becomes a joint venture. In this situation, although FRS 102 refers to an associate that becomes a joint venture, it contains no specific guidance as to what must be done. [FRS 102.14.8(i)]. However, as a joint venture is also accounted under the equity method, the accounting described in Illustration 3-11 above applies.

3.3.2 Distributions received in excess of the carrying amount

When an associate makes dividend distributions to the investor in excess of the investor's carrying amount it is not clear how the excess must be accounted for.

How we see it

A liability under Section 21 is recognised only if the investor is obliged to refund the dividend, has incurred a legal or constructive obligation or made payments on behalf of the associate. In our view, in the absence of such obligations, it is appropriate that the investor recognises the excess of the distribution over the investor's carrying amount in profit or loss. When the associate subsequently makes profits, the investor resumes recognising its share of those profits only when they exceed the excess distributions recognised previously in profit or loss plus any previously unrecognised losses (see 3.2.2.H above).

3.3.3 Equity transactions in an associate's financial statements

The financial statements of an associate that are used for the purposes of equity accounting by the investor may include items within its statement of changes in equity that are not reflected in the profit or loss or components of other comprehensive income, for example, dividends or other forms of distributions, issues of equity instruments and equity-settled share-based payment transactions. Where the associate has subsidiaries and consolidated financial statements are prepared, those financial statements may include the effects of changes in the parent's (i.e., the associate's) ownership interest and non-controlling interest in a subsidiary that did not arise from a transaction that resulted in loss of control of that subsidiary.

Although the description of the equity method in Section 14 together with the requirements in Section 5 *Statement of Comprehensive Income and Income Statement* requires that the investor's share of the profit or loss of the associate is recognised in the investor's profit or loss, and the investor's share of changes in items of other comprehensive income of the associate is recognised in other comprehensive income of the investor. [FRS 102.14.8]. No explicit reference is made to other items that the associate may have in its statement of changes in equity.

Investors will therefore need to determine an appropriate accounting treatment for these different types of transactions that may be accounted for by the associate in its statement of changes in equity.

4 Presentation and disclosures

4.1 Presentation

Under the Companies Act formats, investments in participating interests are classified under fixed asset investments in the balance sheet (see Chapter 6 at 4.3.4). When 'adapted formats' (see Chapter 6 at 4.1) are used, investments in associates are shown as a separate balance sheet item and distinguished between current and non-current items. *[FRS 102.4.2A]*.

Goodwill relating to an associate is included in the carrying amount of the investment. *[FRS 102.14.8(c)]*.

There is no guidance in FRS 102 as to how long-term interests (such as long-term loans for which no payment is intended in the foreseeable future) in associates must be presented and therefore an entity must make an accounting policy choice as to the presentation of such interests. Entities frequently make loans to associates, the terms of which are repayable on demand, but there is no intention of repayment in the foreseeable future. In these circumstances, for entities applying the Companies Act formats, management exercises judgement in determining whether such a loan is a debtor or a fixed asset investment in nature (see Chapter 6 at 4.3.4). For entities applying the adapted formats, such loans need to be classified as appropriate between current or non-current assets (see Chapter 6 at 5.1.1).

In the profit and loss account, for entities applying the Companies Act formats, income from interests in associates is shown as one line item in the profit and loss account. *[6 Sch 20]*. For entities applying the adapted formats, the share of the profit or loss of associates and jointly controlled entities accounted for using the equity method must be included as one line item in the profit and loss account. *[FRS 102.5.5B]*.

4.2 Disclosures

The disclosures required under Section 14 in respect of investments in associates are set out below. Additional disclosures required by the CA 2006 are discussed at 4.2.4 and 4.2.5 below.

4.2.1 General requirements

In both consolidated and individual financial statements where an entity holds an investment in an associate the following is disclosed:

- The accounting policy for investments in associates.
- The carrying amount of investments in associates.
- And
- The fair value of each investment in an associate accounted for using the equity method if a market price for the investment is quoted. *[FRS 102.14.12]*.

4.2.2 Consolidated financial statements

An investor discloses separately:

- Its share of the profit or loss of associates accounted for in accordance with the equity method.
- And
- Its share of any discontinued operations of such associates. *[FRS 102.14.14]*.

4.2.3 Individual financial statements

The individual financial statements of an investor that is not a parent discloses:

- Summarised financial information about the investments in associates.
- And
- The effect of including those investments as if they had been accounted for using the equity method.

Investing entities that are exempt from preparing consolidated financial statements, or would be exempt if the entity had subsidiaries, are exempt from this requirement. *[FRS 102.14.15A]*.

Summarised financial information is not defined in FRS 102, but using the GAAP hierarchy to refer to IFRS 12 *Disclosure of Interests in Other Entities*, it would be appropriate to include: current assets, non-current assets, current liabilities, non-current liabilities, revenue, profit or loss from continuing operations, post-tax profit or loss from discontinued operations, other comprehensive income, total comprehensive income. This list is not exhaustive, and other items may need to be considered if deemed material.

[IFRS 12 Appendix B.12].

For investments accounted for in accordance with the cost model, an investor is required to disclose the amount of dividends and any other distributions recognised as income. *[FRS 102.14.13]*.

For investments in associates accounted for in accordance with fair value through other comprehensive income, an investor must make the disclosures required by Section 11 paragraphs 43 and 44 (this is notwithstanding the fact that paragraph 44 refers to fair value through profit or loss, but the intention is clearly to make these disclosures for fair value through other comprehensive income): *[FRS 102.14.15]*

- The basis for determining fair value (e.g., quoted market price in an active market or a valuation technique. If the latter is used, the assumptions applied in determining fair value for each class of financial assets or liabilities must be disclosed).

And

- If a reliable measure of fair value is no longer available for financial instruments that would otherwise be required to be measured at fair value through profit or loss this fact must be disclosed and the carrying amount of those financial instruments.

For investments in associates accounted for at fair value through profit or loss, the above disclosures will also apply.

4.2.4 Additional company law disclosures - consolidated financial statements

The Regulations also require that the following information must be given where an undertaking included in the consolidation has an interest in an associated undertaking:

- The name of the associate
 - The country in which the associate is incorporated for those incorporated outside the United Kingdom
 - The address of the registered office of the associate
 - The identity and proportion of the nominal value of each class of share held disclosing separately those held by the:
 - Parent company
- And
- Group *[4 Sch 19]*

4.2.5 Additional company law disclosures - individual financial statements

In individual financial statements the Regulations require additional disclosures in respect of significant holdings in undertakings, other than subsidiary entities. A holding is deemed significant if:

- It amounts to 20% or more of the nominal value of any class of shares in the undertaking.
- Or
- The amount of the holding as stated in the company's individual accounts exceeds 20% of the stated net assets of the company. *[4 Sch 4]*.

In practice, this definition will capture most investments in associates. The resulting disclosures in individual financial statements are:

- The name of each associate.
- The address of the registered office of each associate.
- The address of each associate's principal place of business if unincorporated.

And

- The identity and proportion of the nominal value of each class of share held. *[4 Sch 5]*.

For each associate detailed above there must also be disclosed the aggregate amount of the capital and reserves as at the end of its relevant financial year of each entity and its profit or loss for that year (unless the associate is not required to publish its balance sheet anywhere in the world and the holding is less than 50% of the nominal value of the shares, or the information is not material). *[4 Sch 6]*.

A parent that is exempt under Sections 400 or 401 of the Act from the requirement to prepare group accounts is not required to give the additional disclosures listed above in its separate financial statements if it discloses, in the notes to its accounts, the aggregate investment in all significant holdings in undertakings (including its associates) determined by way of the equity method of valuation. *[4 Sch 13]*.

A parent that prepares consolidated financial statements and discloses the information described at 4.2.4 above in respect of its associates is not required to give the disclosures otherwise required by paragraphs 5 and 6 of Schedule 4 of the Regulations in its individual financial statements. *[4 Sch 4]*.

5 Summary of GAAP differences

The key differences between FRS 102 and IFRS in accounting for associates are set out below.

	FRS 102	IFRS
Individual and separate entity financial statements	An entity that is not a parent (i.e., has no subsidiaries) or is a parent that prepares separate financial statements, has the option to account for its investments in associates using either the cost model, at fair value through other comprehensive income (movements follow the PP&E revaluation model and there is no recycling) or at fair value through profit or loss. Under FRS 102, there is no option to use equity accounting in the separate financial statements of an investor that is a parent or the individual financial statements of an investor that is not a parent.	An entity that is not a parent (i.e., has no subsidiaries) accounts for its investments in associates under the equity accounting method unless it meets criteria for exemption. An entity that is a parent and prepares separate financial statements accounts for its investments at cost, in accordance with IFRS 9 (at fair value through other comprehensive income without recycling) or using the equity method.
Investment portfolios/funds	Investments in associates held as part of an investment portfolio must be measured at fair value through profit or loss in the consolidated financial statements of an investor that is a parent.	Venture capital organisations and similar entities can choose to measure investments in associates at fair value through profit or loss. Investment entities must apply this option.
Implicit goodwill and fair value adjustments on acquisition of an associate	Follows the requirements of Section 19. Goodwill is amortised over its finite useful life, but if, in exceptional cases, an entity is unable to make a reliable estimate of the useful life of goodwill, the life must not exceed 10 years.	Generally, follows the IFRS requirements regarding business combinations. Implicit goodwill is not amortised.
Loss of significant influence of an equity-accounted associate that does not become a subsidiary or a jointly controlled entity	If significant influence is lost as a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds and the carrying amount relating to the proportion disposed of. The carrying value of the equity interest retained at the date significant influence was lost becomes the cost of the retained investment. If significant influence is lost for reasons other than a partial disposal, no gain or loss is recognised and the carrying value of the equity-accounted investment at the date significant influence is lost becomes the cost of the retained investment.	If significant influence is lost as a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds together with the fair value of any retained interest and the carrying amount of the total interest in the associate. If significant influence is lost for reasons other than a partial disposal, a gain or loss is recognised based on the fair value of the retained interest and the carrying amount of the interest in the associate at that date.

FRS 102		IFRS
Exchange of business or other non-monetary assets for an interest in an associate in the consolidated financial statement.	Gains that are not realised are reported in other comprehensive income.	No distinction between realised and unrealised gains and all gains/losses are reported in profit or loss.
Disclosures in financial statements (key differences)		
Summarised financial information	Only the individual financial statements of an associate that is not a parent must disclose summarised financial information about its investments in the jointly controlled entities, along with the effect of including those investments as if they had been accounted for using the equity method.	Summarised financial information of material associate and individually material associates (in aggregate) required in the consolidated accounts of a venturer.
Restrictions	Not Applicable	The nature and extent of any significant restrictions on the ability of associates to transfer funds to the entity in the form of cash dividends, or to repay loans or advances made by the entity is required to be disclosed.
Non-coterminous financial statements of an associate	Not Applicable	When the financial statements of an associate used in applying the equity method are as of a date or for a period that is different from that of the entity the following are disclosed: (i) The date of the end of the reporting period of the financial statements of that joint venture or associate. And (ii) The reason for using a different date or period.
Unrecognised share of losses	Not Applicable	Disclosure of the unrecognised share of losses of an associate, both for the reporting period and cumulatively, if the entity has stopped recognising its share of losses of the associate when applying the equity method.

Appendix A - Defined terms

Extract from FRS 102 Appendix 1 Glossary

Definitions

associate	An entity, including an unincorporated entity such as a partnership, over which the investor has significant influence and that is neither a subsidiary nor an interest in a joint venture .
consolidated financial statements	The financial statements of a parent and its subsidiaries presented as those of a single reporting entity.
held as part of an investment portfolio	An interest is held as part of an investment portfolio if its value to the investor is through fair value as part of a directly or indirectly held basket of investments rather than as media through which the investor carries out business . A basket of investments is indirectly held if an investment fund holds a single investment in a second investment fund which, in turn, holds a basket of investments. In some circumstances, it may be appropriate for a single investment to be considered an investment portfolio, for example when an investment fund it first being established and is expected to acquire additional investments.
impracticable	Applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so.
individual financial statements	The accounts that are required to be prepared by an entity in accordance with the Act or relevant legislation, for example: (a) 'individual accounts', as set out in section 394 of the Act; (b) 'statement of accounts', as set out in section 132 of the Charities Act 2011; or (c) 'individual accounts', as set out in section 72A of the Building Societies Act 1986. Separate financial statements are included in the meaning of this term.
parent	An entity that has one or more subsidiaries .
separate financial statements	Those presented by a parent in which the investments in subsidiaries , associates or jointly controlled entities are accounted for either at cost or fair value rather than on the basis of the reported results and net assets of the investees. Separate financial statements are included within the meaning of individual financial statements .
significant influence	Significant influence is the power to participate in the financial and operating policy decision of the associate but is not control or joint control over those policies.
subsidiary	An entity, including an unincorporated entity such as a partnership, that is controlled by another entity (known as the parent).

Overview

This chapter addresses the requirements of Section 15 *Investments in Joint Ventures* which applies to investments in joint ventures in consolidated financial statements and the individual financial statements of a venturer that is not a parent. Section 15 also applies to investments in jointly controlled operations and jointly controlled assets in the separate financial statements of a venturer that is a parent. In its separate financial statements, a venturer that is a parent accounts for investments in jointly controlled entities in accordance with Section 9 *Consolidated and Separate Financial Statements*.

What you need to know

- A joint venture is a contractual arrangement whereby two or more parties undertake an economic activity that is subject to joint control. A joint venture is classified as a jointly controlled entity, jointly controlled operation or jointly controlled asset.
- Investments in jointly controlled entities in the scope of Section 15 are accounted for using the equity method as described in Section 14 *Investments in Associates*.
- In respect of its interest in a jointly controlled operation, a venturer recognises the assets that it controls and the liabilities that it incurs, and the expenses that it incurs and its share of the revenue that it earns from the sale of goods or services by the jointly controlled operation.
- In respect of its interest in a jointly controlled asset, a venturer recognises:
 - Its share of the jointly controlled assets.
 - Any liabilities it has incurred and its share of any incurred jointly.
 - Any revenue from the sale or use of its share of the output of the jointly controlled asset and its share of expenses incurred by the jointly controlled asset.
 - And
 - Any expenses it has incurred in respect of its interest in the jointly controlled asset.
- A venturer that is not a parent but has one or more interests in jointly controlled entities measures all such interests using either the cost model, at fair value with changes recognised in other comprehensive income, without recycling, or at fair value with movements recognised in profit or loss.

1 Introduction

Section 15 sets out the accounting and disclosure requirements for joint ventures in consolidated financial statements, separate financial statements of a venturer that is a parent and individual financial statements of a venturer that is not a parent. *[FRS 102.15.1]*.

A 'joint venture' is a contractual arrangement whereby two or more parties undertake an economic activity that is subject to joint control. The exact form of the strategic investment can vary and Section 15 addresses that variation by classifying joint ventures into three categories: jointly controlled assets, jointly controlled operations and jointly controlled entities. *[FRS 102.15.3]*.

Joint ventures are commonplace in many industry sectors, often as a means of pooling resources or expertise, risk sharing or new product development. The term is sometimes used loosely to describe any commercial partnership type arrangement, but it is important to emphasise that only those where contractually based joint control exists will fall within the scope of Section 15.

2 Comparison between Section 15 and IFRS

There are differences between the accounting and disclosure requirements in Section 15 compared with IFRS 11 *Joint Arrangements*. The key differences are discussed below and summarised at 5 below.

2.1 Scope and classification

As noted above, Section 15 classifies joint ventures as either jointly controlled operations, jointly controlled assets or jointly controlled entities.

IFRS 11 addresses joint arrangements and only makes the distinction between joint operations and joint ventures. This distinction is based on the rights and obligations under the arrangement, rather than focussing on the legal form of the entity. [IFRS 11.14]. Where the parties with joint control have an interest in the net assets of the arrangement then the arrangement will be a joint venture, [IFRS 11.16], which is the equivalent of a jointly controlled entity under Section 15. Otherwise, where the parties with joint control have rights to underlying assets and obligations for liabilities the arrangement will be a joint operation. [IFRS 11.15]. Determining the appropriate classification under IFRS 11 involves an assessment of a venturer's rights and obligations under the arrangement, based on the detailed guidance within the standard.

Generally, arrangements that are jointly controlled operations or jointly controlled assets under Section 15 would be joint operations under IFRS 11. Although many arrangements that are jointly controlled entities under Section 15 would be classified as joint ventures under IFRS 11, some would have to be classified as joint operations due to the requirement to assess rights and obligations rather than focussing on the legal form of the entity.

2.2 Individual and separate entity financial statements

Section 15 permits entities that are not parents to account for their investment in jointly controlled entities using either cost less impairment, at fair value with changes in fair value recognised through other comprehensive income (unless reversing a revaluation decrease of the same investment previously recognised in profit or loss, in which case the revaluation increase is recognised in profit or loss, or where a revaluation decrease exceeds increases previously recognised in respect of the same investment, in which case the excess is recognised in profit or loss) or at fair value with changes in fair value recognised through profit or loss (see 3.5.2.B below). [FRS 102.15.9]. The same accounting policy choice is available for a venturer accounting for their investment in jointly controlled entities that is preparing separate financial statements in accordance with Section 9. [FRS 102.9.26].

Under IFRS, an entity that is not a parent must prepare individual financial statements in which its investments in jointly controlled entities are accounted for under the equity accounting method unless it meets the criteria for exemption. [IAS 28.16, IAS 28.17]. An entity preparing separate financial statements under IFRS has an accounting policy choice of measuring investments in jointly controlled entities at cost, in accordance with IFRS 9 *Financial Instruments*, or using the equity method of accounting. [IAS 27.10].

2.3 Investment portfolios/funds

Under Section 15, a venturer that is a parent and has investments in jointly controlled entities that are held as part of an investment portfolio is required to measure those investments at fair value through profit or loss in the consolidated financial statements (see 3.5.3.B below). [FRS 102.15.9B].

Under IFRS, the measurement of investments in joint ventures at fair value through profit or loss is an option that is only available for an entity which is a venture capital organisation or a mutual fund, unit trust and similar entities including investment-linked insurance funds or one which holds its investments indirectly through such an entity. [IAS 28.18].

2.4 Implicit goodwill and fair value adjustments on acquisition of an equity-accounted jointly controlled entity

Section 15 (via Section 14) requires the use of Section 19 *Business Combinations and Goodwill* to determine the implicit goodwill on the acquisition of a jointly controlled entity. The implicit goodwill is then amortised over its useful life. If an entity is unable to make a reliable estimate of the useful life of goodwill, the life must not exceed 10 years. [FRS 102.14.8(c), FRS 102.19.23]. Under IFRS, implicit goodwill is not amortised.

2.5 Loss of joint control of an equity-accounted jointly controlled entity that does not become a subsidiary or an associate

Section 15 (via Section 14) requires that where loss of joint control is as a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds and the carrying amount relating to the proportion disposed of. The carrying value of the equity interest retained at the date joint control is lost becomes the cost of the retained investment and there is no measurement of the retained interest at fair value.

If the loss of joint control is for reasons other than a partial disposal, for example a change in circumstances such as the joint venture issuing shares to third parties, no gain or loss is recognised and the carrying value of the equity-accounted investment as at the date at which joint control is lost becomes the cost of the retained investment. *[FRS 102.14.8(i)].*

Under IFRS, where loss of joint control is as a result of a partial disposal, a gain or loss is recognised based on any difference between the disposal proceeds together with the fair value of any retained interest and the carrying amount of the total interest in the joint venture.

If the loss of joint control is for reasons other than a partial disposal, a gain or loss is recognised based on the fair value of the retained interest and the carrying amount of the interest in the joint venture at that date. *[IAS 28.22].*

2.6 Transactions to create a jointly controlled entity

Section 9 sets out the requirements in respect of transactions where a venturer may exchange a business, or other non-monetary asset, for an interest in another entity, and that other entity becomes a jointly controlled entity of the venturer. To the extent that the fair value of the consideration received by the venturer exceeds the carrying value of the part of the business, or other non-monetary assets exchanged and no longer owned by the venturer, and any related goodwill together with any cash given up, the venturer recognises a gain. Any unrealised gain arising on the exchange is recognised in other comprehensive income. To the extent that the fair value of the consideration received is less than the carrying value of what has been exchanged, together with any related goodwill and cash given up, a loss is recognised (see 3.8 below).

IFRS, does not distinguish between realised and unrealised gains for equivalent transactions and requires that gain or loss, realised or unrealised, to be recognised in profit or loss. *[IFRS 10.B98].*

3 Requirements of Section 15 for investments in joint ventures

3.1 Scope

Section 15 applies to investments in:

- Joint ventures in consolidated financial statements
 - Joint ventures in the individual financial statements of a venturer that is not a parent (see 3.5.2 below)
- And
- Jointly controlled operations and jointly controlled assets in the separate financial statements of a venturer that is a parent (see 3.5.3.A below)

A venturer that is a parent accounts for interests in jointly controlled entities in its separate financial statements in accordance with paragraphs 9.26 and 9.26A of FRS 102, as appropriate (see Chapter 8 at 4.2). [FRS 102.15.1].

3.2 Definition of a joint venture and related terms

Section 15 defines joint venture as follows: [FRS 102.15.3]

Extract from FRS 102

15.2 A joint venture is a contractual arrangement whereby two or more parties undertake an economic activity that is subject to joint control. Joint ventures can take the form of jointly controlled operations, jointly controlled assets or jointly controlled entities.

An economic activity is not defined in FRS 102 but is intended to be broadly based given that joint ventures can take many forms (see 3.2.5 below).

Joint control is defined as “the contractually agreed sharing of control over an economic activity and exists only when the strategic financial and operating decisions relating to the activity require the unanimous consent of the parties sharing control (the venturers)”. [FRS 102.15.2].

How we see it

Although FRS 102 does not define what strategic, financial and operating decisions would cover, these are generally understood to include areas such as budgeting, capital expenditure, treasury management, dividend policy, production, marketing, sales and human resources.

FRS 102 defines control (of an entity) as “the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities”. [FRS 102 Appendix I]. The concept of control is discussed further in Chapter 8 at 2.3.

A venturer is defined as “a party to a joint venture that has joint control over that joint venture”.

[FRS 102 Appendix I].

Section 15 offers no further guidance on the following:

- Parties to a joint venture that are not venturers
- And
- The nature of the contractual arrangements or joint control (in particular the concept of unanimous consent) which are key to an understanding of a joint venture

These aspects are discussed in the following sections making reference to additional guidance in IFRS 11 when relevant. As Section 10 *Accounting Policies, Estimates and Errors*, requires management to use its judgement in developing and applying an accounting policy when a transaction is not specifically addressed by the standard, management may consider the requirements and guidance in IFRS dealing with similar and related issues. [FRS 102.10.5, FRS 102.10.6].

3.2.1 'Venturer' versus 'investor'

In addition to 'venturers', there may well be other investors in the joint venture. In the absence of a definition of an 'investor' in FRS 102, it is clear from the definition of a 'venturer' that an investor in a joint venture must be a party to a joint venture that does not have joint control over the joint venture. This is illustrated by Illustration 3-1.

Illustration 3-1: 'Venturer' versus 'investor'

A, B and C establish a fourth entity D, of which A owns 40%, B 11% and C 49%. A and B enter into a contractual arrangement whereby any financial and operating decisions taken by A and B relating to the activity of D require the unanimous consent of A and B. A simple majority of D's shareholders only is required for all major decisions. An analysis based on the relevant definitions would regard A and B as being 'venturers', and C as an 'investor', in D.

The interest of an 'investor' in a jointly controlled entity is treated as either:

- An associate within the scope of Section 14 if the investor has significant influence over the entity (see Chapter 17)
- Or
- Otherwise as a financial asset within the scope of Section 11 *Basic Financial Instruments* or Section 12 *Other Financial Instruments Issues* (see Chapter 13) [FRS 102.15.18].

3.2.2 Contractual arrangement

Contractual arrangements can be evidenced in several ways. An enforceable contractual arrangement is often, but not always, in writing (we expect unwritten agreements to be rare in practice). Statutory mechanisms can create enforceable arrangements, either on their own or in conjunction with contracts between the parties. [IFRS 11.B2]. A contractual arrangement may be incorporated into the articles or other formation documents of the entity. [IFRS 11.B3].

The contractual arrangement sets out the terms upon which the parties agree to share control over the activity that is the subject of the arrangement. IFRS 11 provides some relevant guidance on the aspects generally specified in the contractual arrangement for a joint arrangement which could equally be applied to a joint venture under FRS 102 using the GAAP hierarchy in Section 10.

Contractual arrangements generally specify the following: [IFRS 11.B.4]

- Purpose, activity and duration of the joint arrangement
- Appointment of members of the board of directors (or equivalent governing body)
- Decision-making processes
 - Matters requiring decisions from the parties
 - Voting rights of the parties

And

 - Required level of agreement for those matters
- Capital or other contribution requirements
- Sharing of assets, liabilities, revenues, expenses or profit or loss relating to the joint arrangement

3.2.3 Joint control and unanimous consent

In order to establish whether joint control of an arrangement exists, it is necessary to establish whether the contractual arrangement gives all the parties to that arrangement (or a group of the parties) control of the arrangement in the collective sense. That means the parties (or a group thereof) must need to act together to direct the strategic, financial and operating policies of the arrangement. It follows that there must be at least two parties for there to be joint control.

Section 15 includes the specific requirement for 'unanimous consent' in the definition of joint control. Unanimous consent means that any party to the arrangement can prevent any of the other parties, or group of the other parties, from making decisions of a strategic, financial or operating nature without its consent. This ensures that no single party can control the arrangement. This means, for example, that none of the parties to the contractual arrangement must have a casting vote that enables it to resolve a deadlock, as that would constitute a form of unilateral control. [FRS 102.15.2].

Care is required in situations where a contractual arrangement may identify one venturer as the operator or manager of the joint venture. The operator does not control the joint venture if it acts within the

financial and operating policies agreed by the venturers in accordance with the contractual arrangement and delegated to the operator. If, however, the operator does have the power to govern (i.e., not merely to execute) the financial and operating policies of the economic activity, the operator controls the venture, and the venture is a subsidiary of the operator and not a joint venture.

3.2.4 Potential voting rights

An entity may own share warrants, share call options, debt or equity instruments that are convertible into ordinary shares, or other similar instruments that have the potential, if exercised or converted, to give the entity voting power or reduce another party's voting power over the financial and operating policies of another entity (potential voting rights).

How we see it

Potential voting rights are not addressed directly in Section 15. Nevertheless, the existence of potential voting rights may be relevant to an assessment of joint control, as explained in Section 9, since control can be achieved by having options or convertible instruments that are currently exercisable. However, the contractual arrangement giving rise to joint control will tend to override relative ownership interests (voting and potential voting rights). This is an issue that will need to be addressed in the light of individual facts and circumstances. [FRS 102.9.6].

3.2.5 Types of joint venture

Section 15 explains that joint ventures can take one of three forms, all sharing the common characteristics of an underlying contractual arrangement and joint control. The three forms are:

- Jointly controlled operations (see 3.3 below)
- Jointly controlled assets (see 3.4 below)
- Jointly controlled entities (see 3.5 below)

3.3 Jointly controlled operations

3.3.1 Definition

Jointly controlled operations arise when a joint venture is established that does not involve the formation of a separate corporation, partnership or other entity or financial structure that exists separately from the venturers. Instead, the joint venture uses assets and other resources of the venturers. In such a case each venturer will use its own property, plant and equipment and carries its own inventories. It also incurs its own expenses and liabilities and raises its own finance, which represent its own obligations. The joint venture activities may be carried out by the venturer's employees alongside the venturer's similar activities. The joint venture agreement usually provides a means by which the revenue from the sale of the joint product and any expenses incurred in common are shared among the venturers. [FRS 102.15.4].

An example of a jointly controlled operation might be where two or more venturers combine their operations, resources and expertise in order to jointly manufacture, market and distribute a particular product. Each venturer undertakes a different part of the manufacturing process and bears its own costs. Revenue from the sale of the product is then shared on the basis of the contractual arrangement. There is no separate entity conducting the business of manufacturing and selling the product. It is merely an extension of the venturers' existing businesses.

3.3.2 Accounting requirements for jointly controlled operations

In respect of its interests in jointly controlled operations, a venturer recognises in its financial statements:

- The assets that it controls and the liabilities that it incurs.
- And
- The expenses that it incurs and its share of the revenue that it earns from the sale of goods or services by the joint venture. [FRS 102.15.5].

As the assets, liabilities, income and expenses will already be reflected in the individual financial statements of the venturer (including the separate financial statements of a venturer that is a parent) then no adjustments or other consolidation procedures are required in respect of these items if the venturer presents consolidated financial statements.

When venturers are funding the operations of a jointly controlled operation they may need to account for a receivable or payable from other venturers, as illustrated in Illustration 3-2 below.

Illustration 3-2: Loans to jointly controlled operations

Two entities, A and B, each own half of a jointly controlled operation. In the joint venture agreement, revenue from the sale of the joint product and expenses incurred in common are shared equally between the A and B. A has lent £400 to the jointly controlled operation, while B has lent £300. How must A account for its loan?

The jointly controlled operation has total borrowings of £400 + £300 = £700. A's share in the borrowings of £350 (=50% of £700) must be offset against its receivable of £400. A must, therefore, account for a net receivable from its joint venture partner of £50 (=£400 - £350).

The jointly controlled operation is not a separate legal entity and under the joint venture agreement A has a business relationship only with B. Gross presentation of a receivable of £200 (=£400 - 50% of £400) and a liability of £150 (=50% of £300) would therefore not be appropriate.

3.4 Jointly controlled assets

3.4.1 Definition

Jointly controlled assets arise in circumstances where one or more assets are contributed to or acquired for the purpose of the joint venture and those assets are jointly controlled and often jointly owned.

[FRS 102.15.6].

The assets are used to obtain benefits for the venturers, who may each take a share of the output from the assets and bear an agreed share of the expenses incurred. Such ventures do not involve the establishment of an entity or financial structure separate from the venturers themselves, so that each venturer has control over its share of future economic benefits through its share in the jointly controlled assets.

Joint ventures of this type are particularly common in extractive industries. For example, a number of oil companies may jointly control and operate an oil pipeline. Each venturer uses the pipeline to transport its own product in return for which it bears an agreed proportion of the operating expenses of the pipeline. Another example of a jointly controlled asset could be that two entities jointly control a commercial property, each taking a share of the rents received and bearing a share of the expenses.

3.4.2 Accounting requirements for jointly controlled assets

In respect of its interest in a jointly controlled asset, a venturer recognises in its financial statements:

- Its share of the jointly controlled assets, classified according to their nature (i.e., a share in a jointly controlled pipeline to be shown within property, plant and equipment rather than as an investment)
 - Any liabilities that it has incurred (e.g., those it has incurred in financing its share of the assets)
 - Its share of any liabilities incurred jointly with the other venturers in relation to the joint venture
 - Any revenue from the sale or use of its share of the output of the joint venture, together with its share of any expenses incurred by the joint venture
- And
- Any expenses that it has incurred in respect of its interest in the joint venture (e.g., those relating to financing the venturer's interest in the assets and selling its share of the output) [FRS 102.15.7]

As with jointly controlled operations, the assets, liabilities, income and expenses will already be reflected in the individual financial statements of the venturer (including the separate financial statements of a venturer that is a parent), therefore no adjustments or other consolidation procedures are required in respect of these items if the venturer presents consolidated financial statements. Separate accounting records may be limited to a record of the expenses incurred in common and ultimately borne by the venturers according to their agreed shares. Similarly, financial statements may not be prepared for the joint venture itself, although the venturers may prepare management accounts in order to assess the performance of the joint venture.

3.5 Jointly controlled entities

3.5.1 Definition

Section 15 defines a jointly controlled entity as “a joint venture that involves the establishment of a corporation, partnership or other entity in which each venturer has an interest”. The entity would operate in the same way as other entities except that the venturers would have joint control over the entity and its economic activities by virtue of the existence of a contractual arrangement between them. [FRS 102.15.8].

A jointly controlled entity controls the assets of the joint venture, incurs liabilities and expenses and earns income. It manages the joint venture and may enter into contracts in its own name and raise finance for the purposes of the joint venture activity. Each venturer is entitled to a share of the results of the jointly controlled entity based on the requirements in the joint venture agreement.

There are a number of different considerations for the accounting for interests in jointly controlled entities depending on whether the venturer is a parent or not, and if a parent, the financial statements being prepared. These are discussed below.

3.5.2 Venturer that is not a parent

Where a venturer is an entity that is not a parent and hence only prepares individual financial statements, in those financial statements it has a choice of how to account for its interests in jointly controlled entities. It can apply either:

- The cost model (see 3.5.2.A below).
- Fair value with changes in fair value recognised in OCI (or profit or loss) in accordance with paragraphs 15E and 15F of Section 17 *Property, Plant and Equipment* (see 3.5.2.B below).

Or

- Fair value with changes in fair value recognised in profit or loss. [FRS 102.15.9].

In terms of the option to carry interests in jointly controlled entities at fair value through profit or loss or fair value through other comprehensive income, fair value in that context is determined by reference to the guidance in Section 2A *Fair Value Measurement* (see Chapter 4 at 3.7.1.B). [FRS 102.15.9].

There is no option in Section 15 to use the equity method of accounting in individual financial statements (this option exists under IFRS) even though permitted by the Regulations (see 3.10 below). However, the individual financial statements of a venturer that is not a parent must disclose summarised financial information about its investments in jointly controlled entities, along with the effect of including those investments as if they had been accounted for using the equity method. Investing entities that are exempt from preparing consolidated financial statements, or would be exempt if they had subsidiaries, are exempt from this requirement. [FRS 102.15.21A].

3.5.2.A Cost model

A venturer that is not a parent and adopts the cost model, measures its investments in jointly controlled entities at cost less any accumulated impairment losses. Section 27 *Impairment of Assets* applies to the recognition and measurement of impairment losses. [FRS 102.15.10].

Section 15 does not define ‘cost’ of investment. However, Section 2 defines ‘historical cost’ as the value of costs incurred in acquiring or creating the asset, comprising the consideration paid to acquire or create the asset plus transaction costs. [FRS 102.2.69]. The Regulations state that the purchase price of an asset is determined by adding to the actual price paid any expenses incidental to its acquisition and then subtracting any incidental reductions in the cost of the acquisition. [1 Sch.27(1)]. Consistent with this, Section 17 *Property, Plant and Equipment* states that cost is normally either the purchase price paid (including directly attributable costs) or the fair value of non-monetary assets exchanged. [FRS 102.17.10, FRS 102.17.14]. The purchase price would generally represent the fair value of the consideration given to purchase the investment consistent with the guidance in respect of exchanges of businesses or other non-monetary assets (see Chapter 8 at 3.8) and the requirements in respect of measuring the cost of a business combination (see Chapter 22 at 3.6).

A venturer will recognise distributions received from its investments in jointly controlled entities as income irrespective of whether the distributions are from accumulated profits of the jointly controlled entity arising before or after the date of acquisition. [FRS 102.15.11].

3.5.2.B Fair value model

A venturer that is not a parent that accounts for its jointly controlled entity at fair value through other comprehensive income or fair value through profit or loss, initially recognises its investment at the transaction price. [FRS 102.15.14]. 'Transaction price' is not defined but is considered the same as its cost (see 3.6.2.A above).

At each subsequent reporting date, the venturer measures its investments in jointly controlled entities at fair value using the fair value guidance in Section 2A. [FRS 102.15.15].

When the fair value through other comprehensive income model is used, increases in the carrying amount as a result of a revaluation to fair value are recognised in other comprehensive income and accumulated in equity, i.e., revaluation reserve. However, if a revaluation increase reverses a previous revaluation decrease of the same investment that was recognised as an expense, it is recognised in profit or loss. [FRS 102.17.15E]. Decreases as a result of revaluation are recognised in other comprehensive income to the extent of any previously recognised revaluation increase accumulated in revaluation reserve in respect of the same investment. If a revaluation decrease exceeds the revaluation gains accumulated in revaluation reserve in respect of that investment, the excess is recognised in profit or loss. [FRS 102.17.15F]. This means that it is not permissible to carry a negative revaluation reserve in respect of each investment in jointly controlled entities held at fair value (see Chapter 20 at 3.6.3).

Where the fair value through profit or loss model is used, increases and decreases in the carrying amount of the investment as a result of a revaluation to fair value are recognised in profit or loss.

A venturer will recognise distributions received from its investments in jointly controlled entities as income irrespective of whether the distributions are from accumulated profits of the jointly controlled entity arising before or after the date of acquisition. [FRS 102.15.15A].

3.5.3 Venturer that is a parent

3.5.3.A Separate financial statements

A venturer that is a parent accounts for interests in jointly controlled entities in its separate financial statements in accordance with the requirements of Section 9 (see also Chapter 8 at 4.2). [FRS 102.15.1].

The parent is required to apply a policy of accounting for its investments in jointly controlled entities either:

- At cost less impairment (i.e., a cost model).
 - Fair value with changes in fair value recognised in OCI (or profit or loss) in accordance with paragraphs 15E and 15F of Section 17 *Property, Plant and Equipment*
- Or
- At fair value with changes in fair value recognised in profit or loss (guidance on fair value is provided in Section 2). [FRS 102.9.26].

The discussion at 3.5.2.A and 3.5.2.B above with respect to the cost model and the fair value model will be relevant for a parent applying either of these models.

The same choices apply to a parent that is exempt in accordance with Section 9 paragraph 9.3 from the requirement to present consolidated financial statements and therefore presents separate financial statements as its only financial statements. [FRS 102.9.26A].

Section 9 states that a parent must apply the same accounting policy for all investments in a single class (for example investments in subsidiaries that are held as part of an investment portfolio, those that are not so held, associates or jointly controlled entities) but it can elect different policies for different classes. [FRS 102.9.26].

How we see it

As discussed in Chapter 8 at 4.2, in our view, associates or jointly controlled entities held as part of an investment portfolio could be considered as a separate class from other associates or jointly controlled entities in the separate financial statements of a parent. While Sections 14 and 15 do not specifically refer to different classes of associates and jointly controlled entities, we believe that an entity that is not a parent may similarly adopt a different accounting policy in accounting for associates and jointly controlled entities held as part of an investment portfolio to that applied to other associates and jointly controlled entities in its individual financial statements.

3.5.3.B Consolidated financial statements

In its consolidated financial statements, a venturer that is a parent accounts for its investments in jointly controlled entities using the equity method, except where its investments in jointly controlled entities are held as part of an investment portfolio. In the latter case such investments in jointly controlled entities are required to be measured at fair value in its consolidated financial statements with the changes in fair value recognised in profit or loss. [FRS 102.15.9A, FRS 102.9B].

Investments in jointly controlled entities are held as part of an investment portfolio if their value to the venturer is through fair value changes in a directly or indirectly held basket of investments rather than as a means through which the venturer carries out business. A basket of investments is held indirectly if a venturer holds a single investment in a second investment fund which, in turn, holds a basket of investments. In some circumstances, it may be appropriate for a single investment to be considered an investment portfolio, for example when an investment fund is first being established and is expected to acquire additional investments (see Chapter 8 at 3.4.2.A). [FRS 102 Appendix I].

3.6 Equity method

3.6.1 Overview

Under the equity method, an investment is initially recognised at the transaction price (including transaction costs) and is subsequently adjusted to reflect the investor's share of:

- Profit or loss
- Other comprehensive income
- And
- Equity of the associate [FRS 102.14.8]

The investor's share of the jointly controlled entity's profit or loss is recognised in the investor's profit or loss. [FRS 102.5.5, 6 Sch 20(3)]. The investor's share of the jointly controlled entity's other comprehensive income is recognised in the investor's statement of comprehensive income. [FRS 102.5.5A(b)].

The requirements of the equity method are applied to jointly controlled entities, substituting 'joint control' for 'significant influence' and 'jointly controlled entity' for 'associate'. [FRS 102.15.13].

3.6.2 Summary of the equity method

The equity method is discussed in detail in Chapter 17. The key aspects of the equity method as applicable to an investment in a jointly controlled entity are therefore as follows: [FRS 102.14.8]

- A venturer commences equity accounting for a jointly controlled entity from the date it obtains joint control over the entity (see Chapter 17 at 3.3.1).
- Distributions received from the jointly controlled entity reduce the carrying amount of the investment. Adjustments to the carrying amount may also be required as a consequence of changes in the jointly controlled entity's equity arising from items of other comprehensive income (see Chapter 17 at 3.3.2).
- In applying the equity method, the proportionate share of the jointly controlled entity to be accounted for, in many cases, will be based on the venturer's ownership interest in the ordinary shares of the entity. A venturer measures its share of profit or loss and other comprehensive income of the jointly controlled entity as well as its share of changes in the jointly controlled entities' equity based on present ownership interests. Those measurements do not reflect the possible exercise or conversion of potential voting rights (see Chapter 17 at 3.2.2.E).
- On acquisition of the investment in a jointly controlled entity a venturer accounts for any difference (whether positive or negative) between the cost of acquisition and its share of the fair values of the net identifiable assets of the jointly controlled entity in accordance with Section 19, as implicit goodwill (see Chapter 22 at 3.9). A venturer adjusts its share of the jointly controlled entity's profits or losses after acquisition to account for additional depreciation or amortisation of the jointly controlled entity's depreciable or amortisable assets (including goodwill) on the basis of the excess of their fair values over their carrying amounts at the time the investment was acquired (see Chapter 17 at 3.2.2.D). If negative goodwill arises (the acquirer's interest in the net amount of the associate's identifiable assets, liabilities and provisions for contingent liabilities exceeds the cost of the investment), the acquirer must (after reassessing the identification and measurement of the acquiree's assets and liabilities and the measurement of the cost of the combination) recognise the excess up to the fair value of the non-monetary assets acquired in the jointly controlled entity's profit or loss in the periods in which the non-

monetary assets are recovered. Any excess exceeding the fair value of the non-monetary assets acquired is recognised in profit or loss in the periods expected to be benefited. [FRS 102.19.24]. If the interest in the jointly controlled entity is acquired on a piecemeal basis then the approach to such acquisitions is discussed, in the context of equity accounting, in Chapter 17 at 4.2.

- If there is an indication that an investment in a jointly controlled entity may be impaired a venturer tests the entire carrying amount of the investment for impairment in accordance with Section 27 (see Chapter 29) as a single asset. Any goodwill included as part of the carrying amount of the investment in the jointly controlled entity is not tested separately for impairment but, rather, as part of the test for impairment of the investment as a whole (see Chapter 17 at 3.2.2.H and Chapter 17 at 3.2.2.I).
- The venturer eliminates unrealised profits and losses resulting from upstream (jointly controlled entity to investor) and downstream (investor to jointly controlled entity) transactions to the extent of the venturer's interest in the jointly controlled entity. Unrealised losses on such transactions may provide evidence of an impairment of the asset transferred (see Chapter 17 at 3.2.2.G).
- In applying the equity method, the investor uses the financial statements of the jointly controlled entity as of the same date as the financial statements of the investor unless it is impracticable to do so. If it is impracticable, the investor uses the most recent available financial statements of the jointly controlled entity, with adjustments made for the effects of any significant transactions or events occurring between the accounting period ends (see Chapter 17 at 3.2.2.B).
- If the jointly controlled entity uses accounting policies that differ from those of the investor, the investor adjusts the jointly controlled entity's financial statements to reflect the investor's accounting policies for the purpose of applying the equity method unless it is impracticable to do so (see Chapter 17 at 3.2.2.C).
- If a venturer's share of losses of a jointly controlled entity equals or exceeds the carrying amount of its investment in the jointly controlled entity, the venturer discontinues recognising its share of further losses. After the venturer's interest is reduced to zero, the venturer recognises a provision for additional losses (see Section 21 *Provisions and Contingencies*) only to the extent that the venturer has incurred legal or constructive obligations or has made payments on behalf of the jointly controlled entity. If the jointly controlled entity subsequently reports profits, the venturer resumes recognising its share of those profits only after its share of the profits equals the share of losses not recognised (see Chapter 17 at 3.2.2.H).

And

- A venturer discontinues the use of the equity method from the date that joint control ceases. The subsequent accounting depends on the nature of any retained investment. If the investment becomes a subsidiary (because control is obtained), it will be accounted for in accordance with Section 19 (i.e., a step-acquisition, see Chapter 22 at 3.11). If the investment becomes an associate, it will be accounted for in accordance with Section 14 (i.e., it will continue to be accounted for under the equity method, see Chapter 17). Otherwise, on a full or partial disposal, a profit or loss will be recognised based on the difference between the disposal proceeds and the carrying amount relating to the proportion of the jointly controlled entity disposed of. Any retained investment is accounted for as a financial asset in accordance with Section 11 or Section 12 (see Chapter 17 at 3.2.2.J for further discussion).

3.7 Transactions between a venturer and joint venture

3.7.1 Background

It is common for venturers to transact with the joint venture, in particular on the formation of the venture. Typical transactions include:

- The venturers contribute cash to the venture in proportion to their agreed relative shares. The venture then uses some or all of the cash to acquire assets from the venturers for use in the venture.
- The venturers contribute other assets (or a mixture of cash and other assets) to the joint venture with fair values in proportion to the venturers' agreed relative shares in the venture.

And

- The venturers contribute other assets to the joint venture with fair values not in proportion to the venturers' agreed relative shares. Cash 'equalisation' payments are then made between the venturers so that the overall financial position of the venturers corresponds to their agreed relative shares in the venture.

3.7.2 Requirements of Section 15

When a venturer contributes or sells assets to a joint venture, Section 15 requires that the recognition of any portion of a gain or loss from the transaction reflects the substance of the transaction. While the assets are retained by the joint venture and provided the venturer has transferred the significant risks and rewards of ownership, the venturer only recognises that portion of the gain or loss that is attributable to the interests of the other venturers in its consolidated financial statements. However, the venturer recognises the full amount of any loss when the contribution or sale provides evidence of an impairment loss. [FRS 102.15.16].

These requirements are shown in the following Illustrations:

Illustration 3-3: Sale of asset from venturer to joint venture at a profit

Two entities, A and B, establish a joint venture involving the creation of a jointly controlled entity C in which A and B each hold 50%. A and B each contribute £5m in cash to the joint venture in exchange for equity shares. C then uses £8m of its £10m cash to acquire a property from A recorded in the financial statements of A at £6m. It is agreed that £8m is the fair value of the property.

The required accounting entry for A is as follows:

	£m	£m
Dr Cash ⁽¹⁾	3	
Dr Investment in C ⁽²⁾	4	
Cr Property ⁽³⁾		6
Cr Gain on sale ⁽⁴⁾		1

(1) £8m received from C less £5m contributed to C.

(2) £5m initial investment in C, less £1m (share of profit eliminated - see (4) below. In effect, this treatment represents that A still holds 50% of the property at its original carrying value to A (50% of £6m = £3m) plus 50% of the cash held by the joint venture (50% of £2m = £1m)

(3) Derecognition of A's original property.

(4) Gain on sale of property £2m (£8m received from C less £6m carrying value = £2m), less 50% eliminated (so as to reflect only profit attributable to interest of the other venturer B) = £1m.

In Illustration 3-3 above, the elimination of A's share of the profit has been made against the asset that was the subject of the transaction and now held by A. This is based on our suggested approach for the elimination of unrealised profits and losses resulting from downstream transactions (investor to jointly controlled entity) under Section 14, discussed in Chapter 17 at 3.2.2.G. It is also consistent with the treatment where a venture exchanges a non-monetary asset for an interest in another entity that becomes a jointly controlled entity of a venture (see 3.8 below).

Illustration 3-4: Sale of asset from venturer to joint venture at a loss

Two entities, A and B, establish a joint venture involving the creation of a jointly controlled entity C in which A and B each hold 50%. A and B each contribute £5m in cash to the joint venture in exchange for equity shares. C then uses £8m of its £10m cash to acquire a property from A recorded in the financial statements of A at £10m. £8m is agreed to be the fair market value of the property.

The required accounting entry for A is as follows:

	£m	£m
Dr Cash ⁽¹⁾	3	
Dr Investment in C ⁽²⁾	5	
Dr Loss on sale ⁽³⁾	2	
Cr Property ⁽⁴⁾		10

(1) £8m received from C less £5m contributed to C.

(2) Represented by 50% of C's cash of £2m (£10 m from A and B minus £8m to A), plus 50% of £8m (carrying value of the property in books of C).

(3) Loss on sale of property £2m (£8m received from C less £10m carrying value = £2m) not adjusted since the transaction indicated an impairment of the property. In effect, it is the result that would have been obtained if A had recognised an impairment charge immediately prior to the sale and then recognised no gain or loss on the sale.

(4) Derecognition of A's original property.

When a venturer purchases an asset from a joint venture, the venturer does not recognise its share of the profits of the joint venture from the transaction until it resells the assets to an independent party or otherwise realises its carrying amount. For example on an item of property, plant and equipment, this will occur as the asset is depreciated or written down for impairment; therefore, the appropriate proportion of the previously unrecognised profit can be recognised as the asset's carrying value is reduced. A venturer recognises its share of the losses resulting from these transactions in the same way as profits except that losses are to be recognised immediately when they represent an impairment loss. [FRS 102.15.17].

These requirements are shown in the following illustrations:

Illustration 3-5: Sale of asset from joint venture to venturer at a profit

Two entities A and B establish a joint venture involving the creation of a jointly controlled entity C in which A and B each hold 50%. A and B each contribute £5m in cash to the joint venture in exchange for equity shares. C then uses £8m of its £10m cash to acquire a property from an independent third-party D. The property is later sold to A for £12m, which is agreed to be its market value. How must A account for these transactions?

The required accounting entry for A is:

	£m	£m
Dr Property ⁽¹⁾	10	
Dr Investment in C ⁽²⁾	7	
Cr Cash ⁽³⁾		17

- (1) £12m paid to C less elimination of A's share of the profit made by C £2m (50% of £12m sales proceeds less £8m cost to C).
- (2) £5m initial investment in C plus profit on sale of property by C that is attributable to B. In effect, this treatment represents A's 50% interest in the cash held by the joint venture (50% of £14m).
- (3) £5m cash contributed to C plus £12m consideration paid for property.

In Illustration 3-5 above, the elimination of A's share of the profit made by C has been made against the asset that was the subject of the transaction and now held by A. This is based on our suggested approach for the elimination of unrealised profits and losses resulting from upstream transactions (jointly controlled entity to investor) under Section 14, discussed in Chapter 17 at 3.2.2.G.

Illustration 3-6: Sale of asset from joint venture to venturer at a loss

Two entities A and B establish a joint venture involving the creation of a jointly controlled entity C in which A and B each hold 50%. A and B each contribute £5m in cash to the joint venture in exchange for equity shares. C then uses £8m of its £10m cash to acquire a property from an independent third-party D. The property is then sold to A for £7m, which is agreed to be its market value. How must A account for these transactions?

The accounting entry for A is:

	£m	£m
Dr Property ⁽¹⁾	7.0	
Dr Investment in C ⁽²⁾	4.5	
Dr Share of loss of C ⁽³⁾	0.5	
Cr Cash ⁽⁴⁾		12.0

- (1) £7 million paid to C.
- (2) Represented by 50% of C's cash of £9m (£10m from A and B minus £8m to D plus £7m received from A).
- (3) Loss in C's books is £1 million (£8m cost of property less £7m proceeds of sale). A recognises its 50% share because the transaction indicates an impairment of the asset, which is recognised by C as an impairment charge immediately prior to the sale.
- (4) £5m cash contributed to C plus £7m consideration for property.

It may be that transactions occur between a venturer and a joint venture in assets, such as inventories, which are destined for onward sale in the normal course of business by the buying party. The accounting adjustments required are the same as for similar transactions between an investor and its associate - see Illustrations 12.6 and 12.7 in Chapter 17 at 3.2.2.G.

3.7.3 Loans and borrowings between the venturer and joint ventures

The requirement in Section 15 to eliminate partially unrealised profits or losses on transactions with joint ventures is expressed in terms of transactions involving the transfer of assets. The requirement for partial elimination of profits could be read to not apply to items such as interest paid on loans and borrowings between the reporting entity and its joint ventures, since such loans and borrowings do not involve the transfer of assets giving rise to gains or losses. Moreover, they are not normally regarded as part of the investor's share of the net assets of the joint venture, but as separate transactions (except in the case of loss-making joint ventures, where interests in long-term loans and borrowings may be required to be accounted for as if they were part of the reporting entity's equity investment in determining the carrying value of the joint venture against which losses may be offset).

How we see it

We believe that loans and borrowings between the reporting entity and its joint ventures generally are not eliminated in the reporting entity's consolidated financial statements when the interest income and expense are recognised by both parties.

However, if the joint venture has capitalised the borrowing costs, then the investor would need to eliminate a relevant share of its interest income and realise it as the associate depreciates the qualifying asset. The same principle applies to eliminate a share of capitalised management or advisory fees charged to a joint venture.

3.8 Transactions to create a jointly controlled entity

A venturer may exchange a business, or other non-monetary asset, for an interest in another entity, and that other entity becomes a jointly controlled entity of the venturer. Questions arise regarding the use of fair value or previous carrying values and reporting any gain on the transaction.

The requirements in respect of such transactions are set out in Section 9 (see also Chapter 8 at 3.8). The principles are that the only exception to the use of fair values must be in rare circumstances where the transaction is artificial and has no substance and that any unrealised gains are not reported in profit or loss.

Accordingly, the following accounting treatment is applied in the consolidated financial statements of the investor:

- The retained interest in the assets exchanged is not remeasured and included at its pre-transaction carrying amount. The investor retains an ownership interest in the business or other non-monetary assets exchanged, held through the jointly controlled entity. That retained interest, including any related goodwill, is treated as having been owned by the investor throughout the transaction and included at its pre-transaction carrying amount.
- Goodwill is recognised as the difference between:
 - The fair value of the consideration given.
 - And
 - The fair value of the investor's share of the pre-transaction identifiable net assets of the joint venture.

The consideration given for the interest acquired in the jointly controlled entity includes that part of the business or other non-monetary assets exchanged and no longer owned by the investor. I.e., the part effectively sold to the other investors in the associate. The consideration might also include cash or monetary assets to achieve equalisation of values. For example, where all investing parties in the joint venture have contributed assets of values not precisely commensurate with each party's ultimate ownership interest in the joint venture. When it is difficult to value the consideration given, the best estimate of its value may be obtained by valuing what is acquired.

- To the extent that the fair value of the consideration received by the investor exceeds the assets given up, the investor recognises a gain. The assets given up include the part of the business or other non-monetary assets exchanged and no longer owned by the investor, as well as any related goodwill and cash transferred. Any unrealised gain arising on the exchange is recognised in other comprehensive income.
- And

- To the extent that the fair value of the consideration received by the investor is less than the carrying value of assets given up, the investor must recognise a loss. The assets given up include the part of the business or other non-monetary assets exchanged and no longer owned by the investor, as well as any related goodwill and cash transferred. The loss is recognised either as an impairment in accordance with Section 27 or, for any loss remaining after an impairment review of the relevant assets, in profit or loss. [FRS 102.9.31].

The most common situation for these transactions in practice is the contribution of a business for equity in a joint venture (or associate), and such a transaction forms the basis of illustrating the above accounting requirements in Illustration 3-7 below.

Illustration 3-7: Creation of a jointly controlled entity by the transfer of non - monetary assets (1)

A and B are two companies which agree to form a jointly controlled entity (JV Co) in respect of a particular part of each of their businesses. A will own 40% of the JV Co, and B 60%. The parties agree that the total value of the new business is £250m.

A's contribution to the venture is one of its subsidiaries, the net assets of which are included in A's consolidated balance sheet at £60m (including remaining unamortised goodwill of £10m). The fair value of the separable net assets of the subsidiary contributed by A is considered to be £80m. The implicit fair value of the business contributed is £100m (40% of total fair value £250m).

B also contributes a subsidiary, the net assets of which have a carrying amount of £85m (including remaining unamortised goodwill of £15m). The fair value of the separable net assets is considered to be £120m. The implicit fair value of the business contributed is £150m (60% of total fair value £250m).

The carrying and fair values of the businesses contributed by A and B are summarised as follows:

(in £m)	A		B	
	Carrying value	Fair value	Carrying value	Fair value
Separable net assets	50	80	70	120
Goodwill	10	20	15	30
Total	60	100	85	150

How must A account for the set-up of the jointly controlled entity?

The required entries in A would be:

	£m	£m
Dr Share of net assets of JV Co ⁽¹⁾	68	
Dr Goodwill ⁽²⁾	16	
Cr Net assets contributed to JV Co ⁽³⁾		60
Cr Other comprehensive income (gain on disposal) ⁽⁴⁾		24

(1) 40% of (carrying value of A's separable net assets + fair value of B's separable net assets), i.e., 40% × (£50m + £120m) = £68m.

(2) Fair value of consideration given by A less fair value of separable net assets of B's business acquired, i.e., 60% of £100m less 40% of £120m = £12m (which can also be 'proved' as being 40% of B's inherent goodwill of £30m), plus 40% of A's original goodwill of £10m retained (£4m) = £16m. This goodwill will be included in the total carrying value of JV Co.

(3) Previous carrying amount of net assets contributed by A, now deconsolidated. In reality there would be a number of entries to deconsolidate these on a line-by-line basis.

(4) Fair value of consideration received, less carrying value of assets disposed of, i.e., 40% of £150m - 60% of £60m = £24m (which can also be 'proved' as being 60% of the £40m difference between the carrying value and fair value of A's business).

The gain on the transaction in Illustration 3-7 is unrealised because qualifying consideration has not been received. Therefore, the gain is accounted for in other comprehensive income as only realised profits can be recognised in profit or loss. [FRS 102.9.31(c)]. Where part or all of the gain is realised then that portion can be taken to profit or loss. This is illustrated in Illustration 3-8 below:

Illustration 3-8: Creation of a jointly controlled entity by the transfer of non - monetary assets (2)

Assume the same fact pattern as in Illustration 3-7 above, except that A was to receive a stake of only 36% in JV Co. In that case it would be expected that A, having contributed assets worth 40% of the combined entity, would receive a cash payment of £10m (4% of £250m) directly from B in compensation for the reduction in the stake from 40% to 36%.

How must A account for the set-up of the jointly controlled entity?

The required entries in A would be:

	£m	£m
Dr Share of net assets of JV Co ⁽¹⁾	61.2	
Dr Cash	10.0	
Dr Goodwill ⁽²⁾	14.4	
Cr Net assets contributed to JV Co ⁽³⁾		60.0
Cr Profit and loss (gain on disposal)		10.0
Cr Other comprehensive income (gain on disposal) ⁽⁴⁾		15.6

(1) 36% of (carrying value of A's separable net assets + fair value of B's separable net assets), i.e., $36\% \times (£50m + £120m) = £61.2m$.

(2) Fair value of consideration given by A (net of £10m cash received from B) less fair value of separable net assets of B's business acquired, i.e., 64% of £100m (£64m) less £10m = £54m, less 36% of £120m = £10.8m (which can also be 'proved' as being 36% of B's goodwill of £30m), plus 36% of A's goodwill of £10m retained (£3.6m) = £14.4m. This goodwill will be included in the total carrying value of JV Co.

(3) Previous carrying amount of net assets contributed by A, now deconsolidated. In reality there would be a number of entries to deconsolidate these on a line-by-line basis.

(4) Fair value of consideration received (including £10m cash received from B), less carrying value of assets disposed of, i.e., 36% of £150m = £54m plus £10m cash = £64m - 64% of £60m = £25.6m (which can also be 'proved' as being 64% of the £40m difference between the carrying value and fair value of A's business). The gain on disposal of £25.6m has been split based on an allocation between 'realised' and 'unrealised' profit. It has been assumed that no liabilities were transferred to A as part of the consideration, and therefore all the profit backed by cash is treated as realised. This approach is further explained below.

Section 9 does not explain how a realised gain can be distinguished from an unrealised gain. Illustration 3-7 above, adopts a 'top slicing' approach whereby as much of the total gain as is backed by cash is treated as realised (i.e., £10m). 'Top slicing' is the recommended approach to determining realised profits for exchanges of assets in paragraph 3.18 of the ICAEW/ICAS TECH 02/17BL *Guidance on Realised and Distributable Profits under the Companies Act 2006*. Paragraph 3.18A of the guidance states that when the consideration received comprise a combination of assets and liabilities, the profit will be realised only to the extent of any net balance (i.e., cash less liabilities) of qualifying consideration received.

No gain or loss is recognised in those rare cases where the transaction is artificial or lacks substance. In that case, a gain or loss on the exchange is not justified. In these circumstances, disclosure is required. [FRS 102.9.32]. The standard gives no examples of when a transaction is artificial or lacks substance.

3.9 Variable profit share

Venturers may not always be entitled to a fixed proportion of the profit of a jointly controlled entity. Venturers that each have a 50% interest in a joint venture may, for example, agree that:

- In the initial three years of operation one of the venturers will be entitled to 75% of the profits in order to recover its investment quicker.
 - The venturers are entitled to a fixed proportion of cash flows 'as defined in the joint venture agreement'.
- Or
- The profit of the joint venture will be distributed based on an alternative measure of profitability such as earnings before interest, tax, depreciation and amortisation (EBITDA).

It may not be appropriate in those cases for the venturers to account for 50% of the profit of the joint venture. Instead, they would need to take into account the substance of the profit-sharing arrangements that apply in each reporting period, in determining their share of the profits and net assets of the joint venture. A venturer's profit share may therefore differ from its share in the net assets of the joint venture. This situation is not unlike the situation that arises in the case of an investment in an associate that has different classes of equity (see Chapter 17 at 3.2.2.E).

3.10 Company law matters

3.10.1 Jointly controlled entities

The Companies Act does not define a 'joint venture', but paragraph 18 of Schedule 6 of the Regulations refers to a 'joint venture' as an undertaking that is managed "jointly with one or more undertakings not included in the consolidation" in its description of non-corporate joint ventures that are permitted to be dealt with in consolidated financial statements by way of proportional consolidation. [6 Sch 18]. The disclosure requirements for 'joint ventures' are framed in the context of such joint ventures that are proportionally consolidated, [4 Sch 18], and hence under FRS 102, these requirements will not be relevant. However, jointly controlled entities that are equity accounted will be captured by the accounting and disclosure requirements in paragraph 19 of Schedule 6 of the Regulations which refer to 'associated undertakings'.

An '*associated undertaking*' is defined in the Regulations as "an undertaking in which an undertaking included in the consolidation has a participating interest and over whose operating and financial policy it exercises a significant influence, and which is not:

- (a) a subsidiary undertaking of the parent company, or
- (b) a joint venture dealt with in accordance with paragraph 18". [6 Sch 19(1)].

A '*participating interest*' is defined as "an interest held by an undertaking in the shares of another undertaking which it holds on a long-term basis for the purpose of securing a contribution to its activities by the exercise of control or influence arising from or related to that interest". The interest in shares includes interests which are convertible into shares or options to acquire shares, regardless of whether or not they are currently exercisable. Additionally, interests held on behalf of an undertaking are to be treated as held by it. [10 Sch 11(1), 10 Sch 11(3), 10 Sch 11(4)].

Hence an equity interest in a jointly controlled entity, given the nature of the joint control, will meet the definition of an associated undertaking for the purposes of the Regulations.

3.10.2 Measurement in individual entity accounts

Schedule 1 to the Regulations permits the equity method of accounting to be applied in respect of participating interests in the individual entity accounts of a venturer. [1 Sch 29A]. However, since FRS 102 already includes a number of options for accounting for such investments, this option was not introduced to FRS 102. Consequently, this option cannot be applied by a venturer in preparing their individual entity accounts in accordance with FRS 102 (see 3.5.2 above). [FRS 102.BC.A.28].

3.10.3 Presentation and disclosure

3.10.3.A Consolidated financial statements

The Regulations require that equity accounted investments in jointly controlled entities are presented as fixed asset investments in the balance sheet. [6 Sch 20]. When 'adapted formats' (see Chapter 6 at 4.1) are used, investments in jointly controlled entities must be shown as a separate balance sheet item and distinguished between current and non-current items. [FRS 102.4.2A].

Goodwill relating to a jointly controlled entity is included in the carrying amount of the investment. [FRS 102.15.13].

There is no guidance in FRS 102 as to how long-term interests (such as long-term loans for which no payment is intended in the foreseeable future) in jointly controlled entities must be presented and therefore an entity must make an accounting policy choice as to how such interests are presented. Entities frequently make loans to jointly controlled entities, the terms of which mean they are repayable on demand, but there is no intention of repayment in the foreseeable future. In these circumstances, for entities applying Schedule 1 to the Regulations, management will need to exercise judgement in determining whether such a loan is a debtor or a fixed asset investment in nature (see Chapter 6 at 4.3.4.A). For entities applying the adapted formats, such loans will need to be classified as appropriate between current or non-current assets (see Chapter 6 at 4.1.1).

In the profit and loss account, for entities applying the formats of Schedule 1 to the Regulations, income from interests in joint controlled entities are to be shown as one line item in the profit and loss account. [6 Sch 20]. For entities applying the adapted formats, the share of the profit or loss of associates and jointly controlled entities accounted for using the equity method must be included as a single line item in the profit and loss account. [FRS 102.5.5B]. The format of the profit and loss account and balance sheet under FRS 102 are discussed further in Chapter 6.

The Regulations also require that the following information must be given where an undertaking included in the consolidation has an interest in an 'associated undertaking' (which, as discussed at 3.10 above, will also be relevant for equity accounted jointly controlled entities):

- The name of the jointly controlled entity.
- The country in which the jointly controlled entity is incorporated for those incorporated outside the United Kingdom.
- The address of the registered office of the jointly controlled entity.
- The identity and proportion of the nominal value of each class of share held, disclosing separately those held by the:
 - Parent company.
 - And
 - Group. [4 Sch 19].

3.10.3.B Individual financial statements

In individual financial statements the Regulations require additional disclosures in respect of significant holdings in undertakings, other than subsidiary entities. A holding is deemed significant if:

- It amounts to 20% or more of the nominal value of any class of shares in the undertaking.
- Or
- The amount of the holding as stated in the company's individual accounts exceeds 20% of the stated net assets of the company. [4 Sch 4].

In practice, this definition will capture most investments in jointly controlled entities. The resulting disclosures in individual accounts are:

- The name of each jointly controlled entity.
- The address of the registered office of each jointly controlled entity.
- The address of each jointly controlled entity's principal place of business if unincorporated.
- And
- The identity and proportion of the nominal value of each class of share held. [4 Sch 5].

Additional disclosure would also be required in respect of each jointly controlled entity detailed above of:

- The aggregate amount of the capital and reserves of each entity.
- And
- The profit or loss for the year of each entity. [4 Sch 6].

The additional disclosures immediately above are not required when the jointly controlled entity is not required to publish its balance sheet anywhere in the world and the holding is less than 50% of the nominal value of the shares (or the information is not material). [4 Sch 6].

A parent is not required to provide the additional disclosures of paragraph 6 of Schedule 4 in the Regulations in its individual financial statements if it is exempt under Sections 400 or 401 of the Act from the requirement to prepare group accounts and the company discloses, in the notes to its accounts, the aggregate investment in the relevant jointly controlled entities determined by way of the equity method of valuation. [4 Sch 13].

A parent that prepares consolidated financial statements and discloses the information described at 3.10.3.A above in respect of its jointly controlled entities is not required to give the above disclosures in its individual financial statements. [4 Sch 4].

4 Disclosures

Section 15 requires the following disclosures in individual and consolidated financial statements:

- The accounting policy for investments in jointly controlled entities.
- The carrying amount of investments in jointly controlled entities.
- The fair value of each investment in a jointly controlled entity accounted for using the equity method, if a market price for the investment is quoted.

And

- The aggregate amount of commitments relating to joint ventures, including the venturers share in the commitments that have been incurred jointly with other venturers. [FRS 102.15.19].

For jointly controlled entities accounted for using the equity method, a venturer discloses separately its share of the profit or loss of such investments and its share of any discontinued operations of such jointly controlled entities. [FRS 102.15.20].

For jointly controlled entities accounted for at fair value through other comprehensive income, a venturer must make the disclosures required by paragraphs Section 11 paragraphs 43 and 44 (this is notwithstanding the fact that paragraph 44 refers to fair value through profit or loss, but the intention is clearly to make these disclosures for fair value through other comprehensive income): [FRS 102.15.21]

- The basis for determining fair value (e.g., quoted market price in an active market or a valuation technique. If the latter is used, the assumptions applied in determining fair value for each class of financial assets or liabilities must be disclosed).

And

- If a reliable measure of fair value is no longer available for financial instruments that would otherwise be required to be measured at fair value through profit or loss this fact is disclosed and the carrying amount of those financial instruments.

The individual financial statements of a venturer that is not a parent must disclose summarised financial information about its investments in the jointly controlled entities, along with the effect of including those investments as if they had been accounted for using the equity method. Summarised financial information is not defined in FRS 102, but using the GAAP hierarchy to refer to IFRS 12 *Disclosure of Interests in Other Entities*, it would be appropriate to include: current assets, non-current assets, current liabilities, non-current liabilities, revenue, profit or loss from continuing operations, post-tax profit or loss from discontinued operations, other comprehensive income, total comprehensive income. This list is not exhaustive and other items may need to be considered if deemed material. [IFRS 12.B.12]. Investing entities that are exempt from preparing consolidated financial statements, or would be exempt if they had subsidiaries, are exempt from this requirement. [FRS 102.15.21A].

5 Summary of GAAP differences

The key differences between FRS 102 and IFRS in accounting for joint ventures are set out below.

FRS 102		IFRS
Scope and classification	Classifies joint ventures as either jointly controlled operations, jointly controlled assets or jointly controlled entities with different accounting considerations for each. Classification as jointly controlled entity requires existence of a separate legal entity.	Defines joint arrangements and classifies them between joint operations and joint ventures. Classification as a joint venture depends on assessment of the venturer's rights and obligations over the arrangement.
Accounting for jointly controlled operations	A venturer recognises in its financial statements: ▪ The assets that it controls and the liabilities that it incurs - And ▪ The expenses that it incurs and its share of the income that it earns from the sale of goods or services by the joint venture	A joint operator recognises: ▪ Assets, including any share of assets held jointly ▪ Liabilities, including its share of any liabilities incurred jointly ▪ Revenue from the sale of its share of the output by the joint operation ▪ Share of the revenue from the sale of the output by the joint operation - And ▪ Expenses, including its share of any expenses incurred jointly The accounting and measurement for each of these items is in accordance with the applicable IFRS.
Accounting for jointly controlled assets	A venturer recognises in its financial statements: ▪ Its share of the jointly controlled assets, classified according to their nature ▪ Any liabilities that it has incurred ▪ Its share of any liabilities incurred jointly with the other venturers in relation to the joint venture ▪ Any revenue from the sale or use of its share of the output of the joint venture together with its share of any expenses incurred by the joint venture - And ▪ Any expenses that it has incurred in respect of its interest in the joint venture	Although IFRS does not have a concept of jointly controlled assets, such assets would normally qualify as joint operations as defined by IFRS 11. The accounting for joint operations is, in substance, the same as the accounting for jointly controlled assets under FRS 102.

FRS 102		IFRS
Individual and separate entity financial statements	An entity that is not a parent or is a parent that prepares separate financial statements, has the option to account for its investments in jointly controlled entities using either the cost model, fair value through other comprehensive income (movements follow the PP&E revaluation model and there is no recycling) or at fair value through profit or loss. Under FRS 102, there is no option to use equity accounting in the separate financial statements of an investor that is a parent or the individual financial statements of an investor that is not a parent.	An entity that is not a parent (i.e., has no subsidiaries) accounts for its investments in associates under the equity accounting method unless it meets criteria for exemption. An entity that is a parent and prepares separate financial statements accounts for its investments at cost, in accordance with IFRS 9 or using the equity method.
Investment portfolios/funds	Investments in jointly controlled entities held as part of an investment portfolio are measured at fair value through profit or loss in the consolidated financial statements of a venturer that is a parent.	Venture capital organisations and similar entities can choose to measure investments in joint ventures at fair value through profit or loss. Investment entities would elect this option.
Implicit goodwill and fair value adjustments on acquisition of an equity-accounted jointly controlled entity	Follows the requirements of Section 19 of FRS 102. Goodwill is be amortised over its finite useful life, but if, in exceptional cases, an entity is unable to make a reliable estimate of the useful life of goodwill, the life must not exceed 10 years.	Follows the IFRS requirements regarding business combinations. Implicit goodwill is not amortised.
Loss of joint control of an equity-accounted jointly controlled entity that does not become a subsidiary or an associate	If loss of joint control is as a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds and the carrying amount relating to the proportion disposed of. The carrying value of the equity interest retained at the date joint control is lost becomes the cost of the retained investment. If the loss of joint control is for reasons other than a partial disposal, no gain or loss is recognised and the carrying value of the equity-accounted investment at the date joint control is lost becomes the cost of the retained investment.	If loss of joint control is as a result of a partial disposal, a gain or loss is recognised based on the disposal proceeds together with the fair value of any retained interest and the carrying amount of the total interest in the joint venture. If loss of joint control is for reasons other than a partial disposal, a gain or loss is recognised based on the fair value of the retained interest and the carrying amount of the interest in the joint venture at that date.
Exchange of business or other non-monetary assets for an interest in a joint venture in consolidated financial statement.	Gains that are not realised are reported in other comprehensive income.	No distinction between realised and unrealised gains and all gains/losses are reported in profit or loss.

FRS 102		IFRS
Disclosures in financial statements (key differences)		
Summarised financial information	Only the individual financial statements of a venturer that is not a parent must disclose summarised financial information about its investments in the jointly controlled entities, along with the effect of including those investments as if they had been accounted for using the equity method.	Summarised financial information of material Joint Ventures and individually material Joint Ventures (in aggregate) required in the consolidated accounts of a venturer.
Restrictions	Not applicable	The nature and extent of any significant restrictions on the ability of joint ventures to transfer funds to the entity in the form of cash dividends, or to repay loans or advances made by the entity is required to be disclosed.
Non-coterminous financial statements of a Joint Venture	Not applicable	When the financial statements of a joint venture used in applying the equity method are as of a date or for a period that is different from that of the entity the following are disclosed: ▪ The date of the end of the reporting period of the financial statements of that joint venture or associate - And ▪ The reason for using a different date or period
Unrecognised share of losses	Not applicable	Disclosure of the unrecognised share of losses of a joint venture, both for the reporting period and cumulatively, if the entity has stopped recognising its share of losses of the joint venture when applying the equity method.

Appendix A - Defined terms

Extract from FRS 102 Appendix 1 Glossary

Definitions

consolidated financial statements	The financial statements of a parent and its subsidiaries presented as those of a single reporting entity.
control (of an entity)	The power to govern the financial and operating policies of an entity so as to obtain benefits from its activities.
held as part of an investment portfolio	An interest is held as part of an investment portfolio if its value to the investor is through fair value as part of a directly or indirectly held basket of investments rather than as a media through which the investor carries out business. A basket of investments is indirectly held if an investment fund holds a single investment in a second investment fund which, in turn, holds a basket of investments. In some circumstances, it may be appropriate for a single investment to be considered an investment portfolio, for example when an investment fund is first being established and is expected to acquire additional investments.
individual financial statements	The accounts that are required to be prepared by an entity in accordance with the Act or relevant legislation, for example: (a) 'individual accounts', as set out in section 394 of the Act; (b) 'statement of accounts', as set out in section 132 of the Charities Act 2011; or (c) 'individual accounts', as set out in section 72A of the Building Societies Act 1986. Separate financial statements are included in the meaning of this term.
joint control	The contractually agreed sharing of control over an economic activity. It exists only when the strategic financial and operating decisions relating to the activity require the unanimous consent of the parties sharing control (the venturers).
jointly controlled entity	A joint venture that involves the establishment of a corporation, partnership or other entity in which each venturer has an interest. The entity operates in the same way as other entities, except that a contractual arrangement between the venturers establishes joint control over the economic activity of the entity.
joint venture	A contractual arrangement whereby two or more parties undertake an economic activity that is subject to joint control. Joint ventures can take the form of jointly controlled operations, jointly controlled assets or jointly controlled entities.
parent	An entity that has one or more subsidiaries.
separate financial statements	Those presented by a parent in which the investments in subsidiaries, associates or jointly controlled entities are accounted for either at cost or fair value rather than on the basis of the reported results and net assets of the investees. Separate financial statements are included within the meaning of individual financial statements.
subsidiary	An entity, including an unincorporated entity such as a partnership, which is controlled by another entity (known as the parent).
venturer	A party to a joint venture that has joint control over that joint venture.

Overview

This chapter covers the requirements of Section 16 *Investment Property* which prescribes the accounting treatment and related disclosures for investment property, i.e., a property (land or a building - or part of a building - or both) held by the owner, or by the lessee as a right-of-use asset, to earn rentals or for capital appreciation or both. [FRS 102 Appendix I]. Accordingly, this section must be applied in the recognition, measurement and disclosure of investment property.

On initial recognition, investment properties are measured at cost. Subsequently, except for certain properties required or allowed to be measured using a cost model (see 3.1.2 and 3.1.7 below) or measured at cost amount less impairment (see 3.3.3 below), all investment properties are measured using a fair value model. Fair value is determined in accordance with Section 2A *Fair Value Measurement* and any gains and losses from periodic revaluation under the fair value model are recognised in profit or loss. The requirements of Section 2A are discussed in detail in Chapter 10.

A property is required to be transferred to, or from, investment property only when there is a change in use. This transfer occurs when the property meets, or ceases to meet, the definition of investment property and there is evidence of the change in use.

Accounting for properties in the scope of Section 17 *Property, Plant and Equipment* is covered in Chapter 20 and accounting for properties in the scope of Section 13 *Inventories* is covered in Chapter 16.

What you need to know

- Section 16 applies to any property that meets the investment property definition, irrespective of the nature of the business of the reporting entity.
- Judgement is required in determining whether a property qualifies as investment property; an entity must develop criteria so that it can exercise that judgement consistently, and, when classification is difficult, disclose these criteria.
- Investment properties are held at fair value, except for the following:
 - An investment property rented to another group entity may be transferred to property, plant and equipment ('PP&E') or to right-of-use assets and accounted for using the cost model in accordance with Section 17 (for owned properties) or Section 20 *Leases* (for investment property held by the entity as the lessee), respectively.
 - If the fair value of the investment property component of a mixed use property cannot be measured reliably, the entire property is accounted for as PP&E under Section 17 (for owned properties) or, as a right-of-use asset under Section 20 (for investment property held by the entity as the lessee).
 - If, in exceptional cases only, a reliable measure of fair value is no longer available for an investment property, it must remain to be classified as investment property but measured at a cost equal to the carrying amount at the last date when the property was reliably measurable, less impairment (if any), until a reliable measure of fair value becomes available.
 - A valuation technique other than using an unadjusted quoted price is likely to be the most common methodology used in estimating fair value for investment property due to the lack of an active market for identical assets.
 - The definition of 'fair value' in Section 2A is consistent with 'market value' as defined in International Valuation Standards (IVS). But, perhaps confusingly, it differs from the IVS definition of fair value. Management needs to be aware of the conceptual differences between Section 2A and IVS to ensure any values used for financial reporting that are obtained from appraisals, whether external or internal, are consistent with the objective of fair value measurement in accordance with Section 2A.

1 Introduction

What primarily distinguishes investment property from other types of property interests is that its cash flows (from rental or sale) are largely independent of those from other assets held by the entity. By contrast, property used by an entity for administrative purposes or for the production or supply of goods or services do not generate cash flows themselves but do so only in conjunction with other assets. Therefore, FRS 102 proposes a different model for investment properties than for PP&E under Section 17. However, for investment properties rented to another group entities, an entity has an accounting policy choice to transfer such property to PP&E or to right-of-use assets, if applicable (see 3.1.2 below).

Section 16 applies to accounting for investments in properties (i.e., land or buildings) and property interests held by a lessee under a lease (see 3.1.5 below) that meet the definition of investment property (see 3.1 below). This chapter discusses the version of Section 16 contained in the September 2024 edition of FRS 102, which incorporates the *Amendments to FRS 102 The Financial Reporting Standard applicable in the UK and Republic of Ireland and other FRSS - Periodic Review 2024* ('Periodic Review 2024') issued by the FRC in March 2024.

The key Periodic Review 2024 amendments which affect Section 16 are mainly due to the new lease accounting requirements in Section 20, which is based on the on-balance sheet model from IFRS 16 *Leases*. While lessor accounting is substantially unchanged from previous accounting, Section 20 significantly changes the accounting for lessees, requiring them to recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets. Under Section 20, lessees apply a single model for most leases i.e., they no longer need to classify leases as finance leases or as operating leases.

Leases of property that meet the definition of investment property in Section 16 are included in the scope of Section 20. As a consequence, the scope of Section 16 was amended by defining investment property to include both owned investment property and property held by a lessee as a right-of-use asset (see 3.1 below). Further, a number of paragraphs in Section 16 were amended, added or deleted due to the new lease accounting requirements in Section 20. For example:

- In paragraph 4 of Section 16, for mixed use property, if the fair value of the investment property component cannot be measured reliably, then the entire property is accounted for under Section 17, where held by the owner, or Section 20, as a right-of-use asset, if held by the lessee (see 3.1.7 below).
- In paragraph 6 of Section 16, the measurement basis at initial recognition has been updated to state that an investment property held by a lessee as a right-of-use asset is measured initially at its cost in accordance with Section 20 (see 3.2.4 below).
- In paragraph 7 of Section 16, it has been clarified that if a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it measures the right-of-use asset, and not the underlying property, at fair value (see 3.3.1 below).

As mentioned above, Section 20 requires a lessee to measure right-of-use assets arising from leased property in accordance with the fair value model of Section 16 if the leased property meets the definition of investment property. This represents a change from the previous requirements of Section 16. Under previous requirements, the classification of property held under an operating lease as an investment property was an accounting policy election that was available on a property-by-property basis (see 3.1.5 below).

The Periodic Review 2024 also added a revised definition of fair value and added a new Section 2A to provide guidance on fair value measurement, both were amended to align with the definition and guidance in IFRS 13 *Fair Value Measurement*. Section 16 refers to Section 2A in determining the fair value of investment property (see 3.3.1 below).

Other Periodic Review 2024 amendments are editorial in nature and/or intended to merely clarify rather than change the accounting treatment. For example, additional guidance is added when accounting for transfers of assets to or from investment property, i.e., there must be evidence of change in use (see 3.4 below), and clarifies that use of judgement is necessary when determining whether the acquisition of investment property is the acquisition of an asset or a group of assets, or a business combination (see 3.2.8 below).

Except for the new supplier finance arrangements disclosure requirements (effective 1 January 2025), the Periodic Review 2024 is effective for accounting periods beginning on or after 1 January 2026, with early application permitted provided all amendments are applied at the same time (see Chapter 3 at 1.3).

The amendments are applied retrospectively in accordance with paragraph 12 of Section 10 *Accounting Policies, Estimates and Errors* (see Chapter 9 at 3.3.2), except when a specific transitional provision allows or requires otherwise (see Chapter 3 at 1.3). [FRS 102.1.39]. For example, the requirements of the new Section 2A are applied prospectively from the date of initial application (in the same way as a change in accounting estimate). [FRS 102.1.41].

2 Comparison between Section 16 and IFRS

There are some key differences between accounting for investment properties under Section 16 compared to IFRS (IAS 40 *Investment Property*). These are discussed at 2.1 to 2.5 below. The summary at 5 below contains the major GAAP differences.

2.1 Measurement basis after initial recognition

Section 16 requires all property (either owned or held by a lessee as right-of-use assets) meeting the definition of investment property (whose fair value can be measured reliably on an on-going basis - see 2.3 below) to be measured at fair value (see 3.3 below). [FRS 102.16.7]. For investment properties rented to other group entities, an entity has an accounting policy choice (see 3.1.2 below).

IAS 40 permits entities an accounting policy choice to use either cost or fair value for investment properties. Once an entity chooses a measurement basis, it must apply that basis to all of its investment properties. However, there are some exceptions for insurers and similar entities. [IAS 40.30-32C]. IAS 40 does not identify a preferred alternative although the fair value model seems to be the more widely adopted model amongst entities in real estate sector.

Under IFRS, insurance companies and other entities that hold specified assets, including investment properties, whose fair value or return is directly linked to the return paid on specific liabilities (i.e., liabilities that are secured by such investment properties), can choose either the fair value or cost model for all such properties without it affecting the choice available for all the other investment properties that they may hold. However, for some entities that operate an investment fund that provides investors with benefits determined by units in the fund, all properties within such a fund must be measured on the same basis. A similar requirement applies for some entities that issue insurance contracts with direct participation features, for which the underlying items include investment property. This is because IAS 40 does not permit the entity to measure the property held by such a fund partly at cost and partly at fair value.

[IAS 40.32A, IAS 40.32B].

2.2 Mixed use property

Section 16 states that a property that has mixed use must be separated between investment property and other property if the resulting portions could be sold separately or leased out separately under a finance lease. Section 16 further requires consideration of whether the separate investment property component can be fair valued. That is, if the fair value of the investment property component cannot be reliably measured, the entire property is accounted for as PP&E (for owned properties) in accordance with Section 17 or, as a right-of-use asset (for investment property held by the entity as the lessee) in accordance with Section 20 (see 3.1.7 below). [FRS 102.16.4].

Similar to above, IAS 40 requires that a property that has mixed use must be separated between the owner-occupied element and the investment property element only if the two elements could be sold (or leased under a finance lease) separately. However, the entire property is accounted for as PP&E or right-of-use assets, if applicable, only in the event that no separation is possible and if a significant proportion is used for non-investment property purposes. If no separation is possible and if an insignificant proportion is used for non-investment property purposes, the entire property is an investment property. [IAS 40.10].

IAS 40 emphasises that it is only in exceptional cases and only on initial recognition (either by acquisition or change in use) that the entity will be able to conclude that it will not be able to reliably measure the investment property's fair value on a continuing basis. [IAS 40.53]. Accordingly, if separation is possible but on initial recognition the fair value of the investment property element cannot be reliably measured on a continuing basis, the property is still classified as investment property but is measured using the cost model in IAS 16 *Property, Plant and Equipment* for owned investment property or cost model in accordance with IFRS 16 for investment property held by a lessee as a right-of-use asset, until its disposal. The investment property element is assumed to have a nil residual value (see also 2.3 below). [IAS 40.53].

2.3 Inability to reliably measure fair value

Section 16 requires investment property to be measured at fair value at each reporting date. Section 2A provides guidance on determining fair value (see 3.3.1 and 3.3.2 below). [FRS 102.16.7]. If a reliable measure of fair value is no longer available for an asset measured at fair value, its carrying amount at the last date the asset was reliably measurable becomes its new cost. The entity measures the asset at this cost amount less impairment, if any, until a reliable measure of fair value becomes available (see 3.3.3 below).

[FRS 102.2A.23].

Although there is a choice under IAS 40 whether to apply either the fair value or cost model, where an entity adopts the fair value model, "there is a rebuttable presumption that an entity can reliably measure the fair value of an investment property on a continuing basis." Only in exceptional circumstances and only on initial recognition (either by acquisition or change in use) of an investment property may that presumption be rebutted. [IAS 40.53]. In such exceptional cases, the property is measured using the cost model in IAS 16 for owned investment property, or the cost model in accordance with IFRS 16 for investment property held by a lessee as a right-of-use asset, until its disposal. The property is assumed to have a nil residual value. [IAS 40.53]. Once a property is initially recognised at its fair value, it must always be so recognised until disposed of or reclassified for owner-occupation or development for subsequent sale in the ordinary course of the business, even if comparable market transactions become less frequent or market prices become less easily available. [IAS 40.55].

2.4 Investment property rented to another group entity

Section 16 states that if investment property (or part of such property) is rented to another group entity, that property (or the part of that property that is rented to another group entity) must be accounted for either at fair value in accordance with Section 16 or by transferring the property to PP&E and applying the cost model in accordance with Section 17 (for owned properties) or by transferring the property to right-of-use assets and applying the cost model in Section 20 (for investment property held by the entity as the lessee) (see 3.1.2 below). [FRS 102.16.1A, FRS 102.16.4A, FRS 102.16.4B]. Accordingly, the treatment of such property in the individual accounts and in the group accounts would be the same if an entity chooses to account for such property in its individual accounts as PP&E or, if applicable, as right-of-use asset.

Under IFRS, if an entity owns property (either as a freehold property or as a right-of-use asset) that is leased to, and occupied by, its parent or another subsidiary, that property meets the definition of an investment property from the perspective of the entity that owns it. There is no option to treat the property as PP&E, or a right-of-use asset, in the individual financial statements. In the consolidated financial statements the property does not qualify as investment property because the property is owner-occupied from the perspective of the group. Therefore, the lessor treats the property as investment property in its individual financial statements but the same property would be treated differently, i.e., as PP&E or, if applicable, as right-of-use asset, in the consolidated financial statements. [IAS 40.15].

2.5 Disclosures

The disclosure requirements of Section 16 (see 4 below) are less extensive than those of IFRS. For example, unlike IAS 40, Section 16 does not require comparative information to be presented in the reconciliation between the carrying amounts of investment property at the beginning and the end of the reporting period. In addition, IAS 40 and IFRS 13 require extensive amounts of information relating to fair value measurement compared to Section 2A and Section 16.

3 Requirements of Section 16 for investment property

3.1 Definition, scope and initial recognition of investment property

Only items that meet the definition of an 'asset' are recognised in the statement of financial position.

[FRS 102.2.50]. An asset is defined as a present economic resource, which is a right that has the potential to produce economic benefits, that is controlled by the entity as a result of past events. [FRS 102 Appendix I]. This is further discussed in Chapter 4 at 3.6.2.

Accordingly, an entity recognises an asset (e.g., investment property) in the statement of financial position when it is probable that the future economic benefits will flow to the entity and the asset has a cost or value that can be measured reliably. This is consistent with the recognition criteria for PP&E under Section 17. These recognition criteria apply for any costs incurred, whether initially or subsequently (see Chapter 20 at 3.3 and 3.3.3). [FRS 102.17.4].

Section 16 applies to investment property. [FRS 102.16.1]. Investment property is defined as property (land or a building, or part of a building, or both) held by the owner, or by the lessee as a right-of-use asset, to earn rentals or capital appreciation or both. [FRS 102 Appendix I].

This means that any entity, whatever the underlying nature of its business, can hold investment property assets if its intention on initial recognition (either by acquisition or by transfer - see 3.4 below) is to hold them for rent or for capital appreciation or both. Subsequent to initial recognition, reclassifications of assets into and from investment property are discussed at 3.4 below. A property interest held by a lessee under a lease as a right-of-use asset can also be an investment property (see 3.1.5 below).

How we see it

An entity's intention of holding a property plays an important role in determining whether it meets the definition of investment property or not. Such intention affects classification of the property at initial recognition, i.e., either when recognising an asset for the first time, or when an existing asset is to be transferred to, or from, investment property provided such change in intention is supported by evidence of change in use of that asset (see 3.4 below).

In contrast, property held by the owner, or by the lessee as a right-of-use asset, for use in the production or supply of goods or services or for administrative purposes (commonly referred to as 'owner-occupied property'), or property held or under construction for sale in the ordinary course of business is not investment property (see 3.1.11 below). [FRS 102 Appendix I]. Also, properties held primarily for the provision of social benefits are not classified as investment property (see 3.1.6 below). [FRS 102.16.3A]. In addition, a property which has mixed use must be separated between investment property and other property (see 3.1.7 below).

These, or the parts of these, properties that are not investment properties are accounted for either as PP&E under Section 17 (see Chapter 20), as right-of-use asset under Section 20 (see Chapter 23), or as inventories under Section 13 (see Chapter 16). The definition of investment property ensures that all property is covered by one, and only one, section in FRS 102, that is either Section 13, Section 16, Section 17 or Section 20.

Circumstances are not always straightforward particularly if at initial recognition the intention of holding a property is mixed or undetermined (except for land - see 3.1.4 below). For example, an entity could consider the Basis for Conclusions on IFRS 16 *Leases* where it states that "entities that are not in the property industry may not be within the scope of IAS 40 if they sublease a property under an operating lease with the intention of subsequently using the property within their own business. Such a property would not meet the definition of an investment property in IAS 40 because it would not be held solely for rentals, capital appreciation or both." [IFRS 16.BC179(b)]. In this example, the intended use of the property as an owner-occupied property would even be clearer if the sublease of the property would only be for a short period of time in relation to the remaining lease term of the head lease.

How we see it

Considering how an entity's principal activities and its business strategy for the property, including the length of the lease to a tenant, impact the determination of the intended use of the property (and therefore, whether the property meets the definition of an investment property) may require the exercise of judgement based on specific facts and circumstances. An entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and the related guidance in Section 16. If significant, disclosure of this judgement would be required by Section 8 *Notes to the Financial Statements*.

Further, as discussed in 1 above, what primarily distinguishes investment property from other types of property interest is that it generates cash flows (from rental or sale) that are largely independent of those from other assets held by the entity. By contrast, owner-occupied property used by an entity for administrative purposes or for the production or supply of goods or services does not generate cash flows that are attributable only to itself but does so only in conjunction with other assets used in the production or supply process. Section 17 applies to owned owner-occupied property and Section 20 applies to owner-occupied property held by a lessee as a right-of-use asset.

However, even with the distinction described above, it is sometimes difficult to distinguish investment property from owner-occupied property. This chapter therefore gives guidance to help determine whether or not an asset is an investment property (see 3.1.1 to 3.1.12 below).

Section 16 applies to the measurement in a lessor's financial statements of investment property provided to a third-party lessee under an operating lease (see 3.1.8 below). It also applies to the subsequent measurement in a lessee's financial statements of investment property interests held under a lease where the investment property is rented to a third party under an operating lease (see 3.1.5 below). For investment property rented to another group entity under an operating lease, Section 16 applies to the measurement of investment property in a lessor's financial statements, and/or to the subsequent measurement of investment property interests held under a lease in a lessee's financial statements, if the fair value model is selected to be applied to such investment property (see 3.1.2 below). However, Section 16 does not deal with other accounting matters that are dealt with in Section 20 (see Chapter 23), including:

- Classification of leases as finance or operating leases by a lessor.
- Recognition of lease income arising from the leasing of investment property.
- Initial measurement in a lessee's financial statements of property interests held under a lease.
- Measurement in a lessor's financial statements of its net investment in a finance lease.
- Accounting for sale and leaseback transactions.
- Disclosure of information about leases by lessors and lessees.

Section 16 does not apply to investment property rented to another group entity that is transferred to either PP&E or to right-of-use assets (see 3.1.2 below). [FRS 102.16.4A].

In some situations, there may be difficulties in determining whether or not an acquisition of a single investment property or a group of assets - notwithstanding that they may be held within a separate entity or entities - constitutes an acquired business within the scope of Section 19 *Business Combinations and Goodwill*, and judgement will need to be exercised based on the particular circumstances. [FRS 102.16.2A]. This is further discussed in 3.2.8 below.

3.1.1 Investment property under construction

Section 16 does not explicitly scope in investment property under construction. However, it states that an entity determines the cost of a self-constructed investment property in accordance with paragraphs 10 to 14 of Section 17 (see Chapter 20 at 3.4). [FRS 102.16.5].

How we see it

The above reference to Section 17 implies that investment property under construction is within the scope of Section 16 and that classification as an investment property is determined at initial recognition, instead of when construction is completed. Furthermore, it implies that the FRC believe that an investment property under construction is normally recognised and measured initially at cost under Section 17 on the grounds that the fair value cannot be reliably measurable until completion. However, in our view, if the fair value can be reliably measured during construction, then FRS 102 would require that investment property under construction to be held at fair value.

See 3.2.3 below for measurement of investment property under construction at initial recognition.

3.1.2 Investment property leased to other group entities

A property leased to other parties, which would include group entities, under an operating lease is within the scope of Section 16 as it meets the definition of an investment property (see 3.1.8 below).

[FRS 102 Appendix I, FRS 102.16.4A, FRS 102.16.4B].

Note that the treatment of inter-group leased property in the consolidated financial statements can be different from the treatment in standalone financial statements of individual group entities. For example, it may be the case that a property owned by one group company (either as a freehold property or as a right-of-use asset) is held for occupation by another group company. In consolidated financial statements transactions between group entities, including income and expenses in respect of inter-group leased property, are eliminated in accordance with Section 9 *Consolidated and Separate Financial Statements* (see Chapter 8 at 3.5.1). Accordingly, such a property owned by one group company but leased to another will be an owner-occupied property (see 3.1.11 below) from the perspective of the group as a whole but can be classified as an investment property in the financial statements of the individual entity that owns it, provided it meets the definition of an investment property and the owner does not elect the accounting policy choice to transfer such property to PP&E or to right-of-use assets, if applicable. This accounting policy choice is discussed further below. This classification in the lessor's individual financial statements will apply even if the rental is not at arm's length and the individual entity is not in a position to benefit from capital appreciation.

How we see it

A property, that meets the investment property definition (see 3.1 above), which is owned by a group entity (either as a freehold property or as right-of-use asset) but occupied by an associate or a joint venture would be accounted for as investment property in the consolidated financial statements. This is because associates and joint ventures are not part of the group.

A significant amount of feedback from stakeholders suggested that the cost of obtaining a fair value for an investment property that is rented to another group entity far outweighs the benefit, as the information is of little use when the investment property would be treated as PP&E in the consolidated financial statements. As a result, an accounting policy choice was introduced whereby entities that rent investment property to another group entity can choose to measure that investment property either at cost (less depreciation and impairment) or at fair value. [FRS 102.BC.B16.2, FRS 102.BC.B16.3].

Section 16 states that an entity that rents investment property (or part of such property) to another group entity must account for those properties as follows: [FRS 102.16.4A, FRS 102.16.4B]

Extract from Section 16

Investment property rented to another group entity

- 16.4A** An entity that rents investment property to another group entity shall choose to account for those properties either:
- (a) at fair value with changes in fair value recognised in profit or loss in accordance with this section (Section 2A provides guidance on determining fair value); or
 - (b) by transferring them, in the case of investment properties held by the entity as:
 - (i) the owner, to property, plant and equipment and applying the cost model in accordance with Section 17; or
 - (ii) the lessee, to right-of-use assets and applying the cost model in accordance with Section 20.

An entity choosing to apply (b) above shall provide all the disclosures required by the relevant section, other than those related to fair value measurement.
- 16.4B** When only part of a property is rented to another group entity and the remainder is used for other purposes (such as being rented to an external third party or owner-occupied), paragraph 16.4A only applies to the component of that property that is rented to another group entity.

Section 16 is not explicit on whether the accounting policy choice described above can be applied on a property-by-property basis.

How we see it

As currently written, it appears that an entity's accounting policy choice must be applied to all of its investment properties (or part of such property) rented to another group entities.

If an entity subsequently changes its previous choice of accounting policy, this represents a change in accounting policy and must be accounted for retrospectively (see Chapter 9 at 3.3). [FRS 102.10.10, FRS 102.10.12].

3.1.3 Property with the provision of ancillary services

Section 16 provides no guidance on the impact (if any) of ancillary services on the classification of a property as an investment property where such services (e.g., security and maintenance services) are provided by the owner to the user of the investment property.

However, the definition of an investment property requires that the property must be held for capital appreciation and/or rentals rather than for use in the production or supply of goods and services. Therefore, if an owner provides ancillary services to the user of the investment property, exercise of judgement will be required to determine whether or not the property is being held for capital appreciation/rentals or for the income generated by the supply of those ancillary goods and services.

How we see it

Section 16 is silent on this matter. In our view, it would be reasonable to consider the related guidance in adopted IFRS as allowed by Section 10. Paragraph 11 of IAS 40 states that if the owner supplies ancillary services to the user of the investment property, the property will not qualify as an investment property unless these services are an insignificant component of the arrangement as a whole. For example, security and maintenance services provided by the owner of an office building to the lessees who occupy that building are described as being insignificant.

The crucial issue is the extent to which the owner is involved with the underlying business and retains significant exposure to the risks of running a business. IAS 40 does not provide further guidance on when ancillary services are 'significant' (which would result in exclusion of the property from its scope). The IASB concluded that quantitative guidance would create arbitrary distinctions. [IAS 40.B39].

IAS 40, however, uses the example of an owner-managed hotel, which would be precluded from being an investment property as the services provided to guests are a significant component of the commercial arrangement as a whole. Therefore, an owner-managed hotel is owner-occupied property, rather than investment property. [IAS 40.12].

It may be difficult to determine whether ancillary services are so significant that a property does not qualify as an investment property. For example, the owner of a hotel sometimes transfers some responsibilities to third parties under a management contract and the terms of such contracts may vary widely. However, the nature of the asset in question is not the key factor; rather it is the nature of the owner's involvement and interest in the asset. If the owner's position is, in substance, that of a passive investor, a property would be treated as investment property. If, in contrast, the owner has outsourced day-to-day functions while retaining significant exposure to variation in the cash flows generated by the operations that are being executed in the property, such a property would rather be treated as owner-occupied property. [IAS 40.13].

How we see it

As discussed above, IAS 40 refers to owner-managed hotels as being precluded from being investment property. Hotel properties that are leased on arm's length terms to hotel operators may, however, fall to be accounted for as investment property. This is more likely to be the case when:

- The payments under the lease are not significantly determined by the results of the hotel operator (see 3.1.10 below), rather they reflect the general market for such properties.
- And
- The nature of the owner's rights in the arrangements with the operator is not divergent from those usually expected under a property lease.

IAS 40 acknowledges that this question of significance can require judgements to be made. It also specifies that an entity develops consistent criteria for use in such instances that reflect the provisions described above. [IAS 40.14]. If significant, disclosure of this judgement would be required by Section 8 *Notes to the Financial Statements*. [FRS 102.8.6].

3.1.4 Land

The definition of an investment property refers to land as well as buildings. Therefore, land is investment property if it is held to earn rentals or for capital appreciation or both. This is in contrast to land that is held for sale in the ordinary course of business (typically in the shorter term) or held for the production or supply of goods and services or for administrative purposes.

A situation may arise where an entity has land but has not yet decided what this land will be used for.

How we see it

Section 16 is silent on this matter. In our view, it would be reasonable to consider the related guidance in adopted IFRS as allowed by Section 10. IAS 40 provides guidance that if, on initial recognition, land is held for a currently undetermined future use, i.e., if an entity has not determined whether it will use the land as owner-occupied property, or for sale in the ordinary course of business, or to earn rentals or for capital appreciation, it is deemed to be held for capital appreciation and must be classified as investment property.

3.1.5 Property interest held under a lease

Leases of property are included in the scope of Section 20 (see Chapter 23). The Basis for Conclusions to FRS 102 explains that prior to the Periodic Review 2024 amendments, Section 16 applied to property held by a lessee under a finance lease and could be applied to property held under an operating lease, if certain criteria were met. As part of the Periodic Review 2024 amendments (see 1 above), the FRC introduced an on-balance sheet lease accounting model based on IFRS 16, which removed the distinction between finance leases and operating leases for a lessee, amongst other changes. Consequential amendments were made to Section 16 that bring all leases for which right-of-use assets are recognised in scope of Section 16 if the other criteria for accounting for the property as investment property are met. This approach is similar to the approach taken in IAS 40. [FRS 102.BC.B16.5]. Accordingly, properties held by lessees as right-of-use assets that meet the definition of investment property, as described in 3.1 above, are included in the scope of Section 16.

An investment property held by a lessee as a right-of-use asset is initially recognised in accordance with Section 20 (see 3.2.4 below). [FRS 102.16.6]. Subsequently, Section 20 requires a lessee to measure right-of-use assets arising from leased property in accordance with the fair value model in Section 16 if the leased property meets the definition of investment property. However, for investment property rented to another group entity held by the lessee as right-of-use asset, the lessee could elect to apply the fair value model in Section 16 (see 3.3 below) or the cost model in Section 20 (see Chapter 23 at 6.3.1.A) as an accounting policy choice (see 3.1.2 above). [FRS 102.16.4A, FRS 102.20.60].

When a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it will measure the right-of-use asset, and not the underlying property, at fair value. Section 2A provides guidance on determining fair value (see 3.3.1 below). [FRS 102.16.7].

If the right-of-use assets meet the definition of investment property, these are presented in the statement of financial position as investment property (see Chapter 23 at 6.7). [FRS 102.20.75]. In addition to the relevant disclosure requirements in Section 20 (see Chapter 23 at 6.8), a lessee also applies the disclosure requirements in Section 16 for such right-of-use assets (see 4 below). [FRS 102.16.11, FRS 102.20.83].

Subsequent to initial recognition, the related lease liability would be accounted for in a manner similar to other financial liabilities (i.e., on an amortised cost basis). For further discussion on subsequent measurements of lease liabilities and right-of-use assets, see Chapter 23 at 6.3.

3.1.6 Social benefit entities

Section 16 specifically excludes properties whose main purpose is to provide social benefits, from being accounted for as investment properties. For example, social housing held by a public benefit entity (i.e., an entity whose primary objective is to provide goods or services for the general public, community or social benefit and where any equity is provided with a view to supporting the entity's primary objectives rather than with a view to providing a financial return to equity providers, shareholders or members).

[FRS 102 Appendix I]. Such properties held primarily for the provision of social benefits are properties held to supply services, which do not meet the definition of an investment property, and therefore, are accounted for as PP&E in accordance with Section 17 (see Chapter 20). [FRS 102.16.3A, FRS 102.BC.B17.3].

The requirements for property held for the provision of social benefits, as described above, apply to all entities applying FRS 102 and are not restricted to public benefit entities. [FRS 102.BC.B17.1]. On the other hand, public benefit entities may also hold investment properties, being those that are not held primarily to provide social benefits, but return market value rentals and/or are held for their capital appreciation. FRS 102 requires those properties to be accounted for as investment properties. [FRS 102.BC.B17.4].

Accordingly, Section 16 applies to a property acquired and let for social housing if it meets the definition of investment property (see 3.1 above). Grants associated with investment property are accounted for in accordance with Section 24 *Government Grants* (see Chapter 26).

3.1.7 Properties with mixed use

A property may have mixed use and could be partly owner-occupied and partly held for rental. For example, an entity may own a building and occupy some floors for its own use but also sub-lease other floors to tenants. Similarly with industrial/commercial property, an owner could sub-divide and subsequently sell or rent out some portions and retain other portions for own use.

Section 16 requires that mixed use property must be separated between investment property and other property if the resulting portions could be sold separately or leased out separately under a finance lease. [FRS 102.16.4].

How we see it

To meet the above requirements, we consider that a property must actually be in a state and condition to enable the owner to dispose of it or lease it out separately at the end of the reporting period.

The fact that a property could be divided in future periods if the owner so chose is insufficient to conclude that the portions can be accounted for separately. Consequently, if a property requires sub-division before the portions could be disposed of separately, then those parts are not accounted for as separate portions and the entire property must be accounted for as either an investment property or as a non-investment property (e.g., as an owner-occupied property or as an inventory property) until such sub-division occurs or unless sub-division is a non-substantive legal requirement.

In certain instances, portions of a property are leased out under operating leases rather than under finance leases.

How we see it

In our view, an intention to lease out, or the action of leasing out a portion of a property under an operating lease (rather than a finance lease) is *prima facie* evidence that, if it so wished, the entity could also lease out the property under a finance lease - the difference between the two commonly being just the length of the lease. Accordingly, this does not prohibit the application of Section 16 to that portion. If, however, there is evidence that the portion of the property could not be leased out under a finance lease, then Section 16 could not be applied to that portion and further assessment of the facts and circumstances may be needed.

It also seems clear that 'separately' needs to be assessed both in terms of the physical separation (e.g., mezzanine floors and partitioning walls) of the property and to legal separation (e.g., legally defined property boundaries and/or registered separately).

In the UK, as well as in many jurisdictions, properties that are physically sub-divided into different portions (for example, different floors) are registered in a Land or Property registry as one single property and need to be legally sub-divided before a portion can be leased out to another party or disposed of. Often, these legal proceedings are undertaken only at or near the point of sale of, or the assignment of a lease on, that portion of the property concerned. At the end of the reporting period the legal sub-division might not have occurred.

How we see it

For a property that is already physically sub-divided into different portions, we believe that judgement is required to determine whether the legal separation is a substantive requirement that will restrict the portion of the property concerned being currently separable or whether it is a non-substantive requirement where it is currently separable.

For example:

- If the entity owning the property could not be prevented from legally sub-dividing the property, then it is already in a condition to be sold separately and this would not prevent the portion of the property concerned being accounted for as investment property. This would be the case where, for example: the process of sub-dividing the property was entirely within the control of the entity and did not require permission from a third party (which would include the relevant authorities); or if permission from a third party was required, but this was no more than a formality.
- Conversely, if the entity was required to obtain the permission of third parties before legally sub-dividing the property, and such permission could realistically be withheld, the portions of the property concerned are not accounted for separately until such legal sub-division occurs.

Therefore, if the portion of the property concerned otherwise meets the definition of investment property at the end of the reporting period, judgement is required to assess the legal position of the property in determining whether it is appropriate to account for a portion separately under Section 16. Criteria used in the assessments described above must be applied consistently and if significant, disclosure of these judgements would be required by Section 8. [FRS 102.8.6].

In cases where the components of a mixed use property can be physically and legally separated but the fair value of the investment property component cannot be measured reliably, the entire property must be accounted for, in the case of property held by the owner, as PP&E in accordance with Section 17 or, in the case of property held by the lessee, as a right-of-use asset in accordance with Section 20. Section 2A provides guidance on determining fair value (see 3.3.1 below). [FRS 102.16.4].

However, there could also be cases where components of a mixed use property cannot be physically and legally separated but the fair value of the entire property can be measured reliably.

How we see it

Section 16 is silent on this matter. In our view, it would be reasonable to consider the related guidance in adopted IFRS as allowed by Section 10. Under paragraph 10 of IAS 40, in the event that no separation is possible (i.e., portions could not be sold or leased out separately under a finance lease), the property is an investment property only if an insignificant portion is used for non-investment property purposes.

However, IAS 40 does not provide further guidance to clarify what constitutes an 'insignificant portion' for this purpose. The IASB concluded that quantitative guidance would create arbitrary distinctions. [IAS 40.B39].

How we see it

If the portions could not be sold or leased out separately under a finance lease, classification and accounting of the entire property depends on the significance of the portions used for non-investment property purposes; but IAS 40 does not provide further guidance on this. Therefore, the setting of a threshold to evaluate whether or not something is 'significant' or 'insignificant' depends on judgement of facts and circumstances.

Criteria used in the assessments described above must be applied consistently and if significant, disclosure of these judgements would be required by Section 8. [FRS 102.8.6].

3.1.8 Property leased to others

Properties leased to other parties under one or more operating lease are generally investment properties, whether they are owned freehold by the reporting entity or are right-of-use assets relating to properties held by the reporting entity (see 3.1 and 3.1.5 above). Under adopted IFRS, this will also apply if the property is currently vacant while tenants are being sought. [IAS 40.8].

In the real estate industry, properties might have been held for sale in the ordinary course of business since their initial recognition (either by acquisition or transfer - see 3.4.2 below) but are leased out prior to sale in order to minimise cash outflows whilst the entity seeks a buyer; and because prospective buyers may view the existence of such lease contracts positively, especially those that wish to acquire property for investment purposes.

How we see it

In our view, such properties described above - notwithstanding that they are leased to tenants under operating leases - are accounted for as inventories under Section 13 as long as it remains the intention of the entity to hold such properties for sale in the ordinary course of business (see 3.1.9 below). The rent received would be recorded as operating lease income in profit or loss, and would not be treated as a reduction in the cost of inventory. See Chapter 16 at 3.2.2 for further discussion.

When an entity no longer intends to sell an inventory property, Section 16 requires the property to be transferred from inventories to investment properties when, and only when, there is a change in use evidenced, for example, by the commencement of an operating lease to another party (see 3.4 below).

Property that is leased to another party under a finance lease is not an investment property but is accounted for under Section 20 (see Chapter 23).

3.1.9 Property held or under construction for sale in the ordinary course of business

Property held, or being constructed, with the intention of sale in the ordinary course of business is not an investment property. This includes, for example, property acquired exclusively for sale in the near future or for development and resale. This is also irrespective of whether the property is let out or not, as discussed in section 3.1.8 above. Such property is accounted for as inventory under Section 13 (see Chapter 16).

An entity, whose principal business activity is to buy and sell property for short-term gains, may, in some circumstances, buy property (or reclassify existing property following a change in use - see 3.4 below) with the intention of holding it for long-term capital appreciation. Investment property is defined as property held to earn rentals or for capital appreciation or both, rather than for sale in the ordinary course of business (see 3.1 above). The fact that the entity's principal business activity is the buying and selling of property for short-term gains does not, under this definition, prohibit it from classifying properties that are held for long-term capital appreciation as investment properties.

How we see it

While there is no explicit guidance in Section 16 on how to quantify 'short-term', it seems reasonable to define this period based on an entity's operating cycle. That is, for an entity which chooses to use the adapted format in presenting its statement of financial position, as long as an asset is a 'current asset' in terms of the definition in Appendix I to FRS 102 (see Chapter 6 at 4.1.1), an entity could conclude that the asset is held for a short term.

In practice, the classification between investment property and property intended for sale in the ordinary course of business can be a difficult judgement. There is only a fine line between:

- A property held for capital appreciation, and therefore classified as investment property.
- And
- A property intended for sale in the ordinary course of business, which would be classified as inventory.

For example, the owner will undertake activities to increase the property's value prior to sale or where there is uncertainty in obtaining permits required from relevant authorities prior to commencing construction activities. In the latter case, the property, e.g., land, may continue to appreciate in value during the period when there are no development activities - see 3.2.5 below.

Another example is where an entity acquires a tenanted property with a view to redevelop the property and to resell it in the future, but active development will only commence after the existing lease reaches the end of its term, i.e., the entity receives rent payments during the intervening period. As set out at 3.1.8 above, the receipt of rental income from a property would not necessarily be the deciding factor. Certainly, other than for land (see 3.1.4 above), there is no deemed 'default' classification when the future use of a property has not yet been determined (see also discussion in section 3.1 above).

How we see it

While there are different treatments for short-term and long-term holdings of property, sometimes significant judgement is involved in determining whether a property qualifies as investment property or is inventory, not least because the intentions of management are a critical factor. Exercise of judgement is also important because whilst paragraph 9 of Section 16 requires property held as inventory to be reclassified as investment property when the property meets the definition of investment property and there is evidence of a change in use such as the inception of an operating lease to another party, in contrast, a reclassification from investment property to inventories would require a different evidence of a change in use such as the commencement of a development with a view to sale (see 3.4.1 below).

Accordingly, an entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and with the related guidance in Section 16. If significant, disclosure of this judgement would be required by Section 8. [FRS 102.8.6].

3.1.10 Property where rentals are determined by reference to the operations in the property

It may also be inappropriate to consider a property as investment property if the owner is significantly exposed to the operation of the business in the property through a linkage between the rentals charged and the performance of the business.

For a property that is leased out to a retailer under a lease contract in which rentals are being determined by reference to turnover or profit, the appropriate classification of the property can be difficult.

How we see it

Section 16 is silent on this matter. In our view, it would be reasonable to consider the related principles in IAS 40 as allowed by Section 10. In the case described above, if the turnover- or profit-related element is a very significant proportion of total rental, then consideration must be given to whether the landlord is so involved with the underlying business as to make classification of the property as investment property inappropriate. This will be a matter of judgement based on any other specific facts and circumstances (for example, the length of the lease, the level of exposure to the performance of the underlying business or the degree of involvement in the management of the underlying business).

Accordingly, an entity develops criteria so that it can exercise that judgement consistently in accordance with the definition of investment property and with the related guidance in Section 16. If significant, disclosure of this judgement would be required by Section 8. [FRS 102.8.6].

3.1.11 Property held for own use ('owner-occupied')

As noted in 3.1 above, owner-occupied property, that is property (either owned or held by a lessee as right-of-use asset) held for use in the production or supply of goods or services or for administrative purposes, is specifically excluded from being treated as investment property and is subject to the provisions of Section 17 or, where applicable, Section 20. Under adopted IFRS, owner-occupied property includes (among other things):

- Property that is going to be owner-occupied in the future (whether or not it has first to be developed).
 - Property occupied by employees (whether or not they pay rent at market rates).
- And
- Owner-occupied property awaiting disposal. [IAS 40.9].

Note that the treatment in the consolidated financial statements of a property held by a group entity (either owned or held by a lessee as right-of-use asset) for rent to another group entity under an operating lease, can be different from the treatment in standalone financial statements of such individual group entity. This is further discussed in 3.1.2 above.

3.1.12 Group of assets leased out under a single operating lease

It is sometimes the case in practice that a group of assets comprising land, buildings and 'other assets' is leased out by a lessor under a single lease contract in order to earn rental income. In such a case, the 'other assets' would generally comprise assets that relate to the manner in which the land and buildings are used under the lease. The issue that arises is under what circumstances the 'other assets' must be regarded by the lessor as part of an investment property rather than as a separate item of PP&E (or another asset). This is shown in the following Illustration:

Illustration 3-1: Definition of an investment property: a group of assets leased out under a single operating lease

A lessor enters into the following two single contract leases in order to earn rental income. All the individual assets subject to the leases meet the test of being classified as an operating lease. The lessor applies the fair value measurement model for subsequent measurement of investment property.

Lease 1: Vineyard and winery

A vineyard including a winery is leased out under an operating lease. The vineyard comprises the following assets:

- Land
- Vineyard infrastructure (e.g., trellises)
- Winery building structures

- Winery plant and machinery (crushing equipment, distilling equipment)
- Vines (grapes are excluded, as they belong to the lessee)

Lease 2: Port

A port is leased out under an operating lease. The port comprises the following assets:

- Land
- Warehouses
- Transport infrastructure to and from the port (roads, rail tracks, bridges)
- Wharves
- Light towers (that enable the 24-hour operation of the port)
- Specialised container cranes (to be able to move containers around)

To what extent can the 'other assets' included in the leases (but which are not considered to constitute a piece of land or a building) be included in the investment property definition under Section 16?

The consequence of including plant and equipment in the definition of investment property is that if the investment property is accounted for at fair value, changes in the fair value of that plant and equipment will, like changes in the fair value of the land and buildings, be recognised in profit or loss.

From a literal reading of the definition of an investment property (see 3.1 above), it could be argued that an investment property can consist only of a building (or part of a building), a piece of land, or both and cannot include 'other assets'. However, such an interpretation is inconsistent when determining the carrying amount of investment property under the fair value model, which implies that a broader interpretation is more appropriate.

Under adopted IFRS, further guidance is given as follows: [IAS 40.50(a), IAS 40.50(b)]

Extract from IAS 40

- 50** In determining the carrying amount of investment property under the fair value model, an entity does not double-count assets or liabilities that are recognised as separate assets or liabilities. For example:
- (a) equipment such as lifts or air-conditioning is often an integral part of a building and is generally included in the fair value of the investment property, rather than recognised separately as property, plant and equipment.
 - (b) if an office is leased on a furnished basis, the fair value of the office generally includes the fair value of the furniture, because the rental income relates to the furnished office. When furniture is included in the fair value of investment property, an entity does not recognise that furniture as a separate asset.
 - (c) ...

Although paragraph 50 of IAS 40 addresses the fair valuation of investment property, it nevertheless implies that other assets that are integral to the land and buildings or are otherwise required to be included in the lease in order to generate rental income under the lease concerned must also be regarded as being part of the investment property. Further, the separation of this group of assets in two parts - one part being classified as investment property and the other part being classified as an item of property, plant and equipment - might be misleading, as the entire group of assets generates a single stream of revenue.

Consequently, an item other than a piece of land or a building must be regarded by a lessor as being part of an investment property if this item is an integral part of it, that is, it is necessary for the land and buildings to be used by a lessee in the manner intended and is leased to the lessee on the same basis (e.g., as a package with the same lease term) as the land and buildings. In determining whether all the assets can be classified as investment property, the following conditions must be considered:

- The land and buildings must be the 'dominant assets' that form the investment property.
 - The 'other assets' are leased to the lessee together with the land and building as a whole.
- And
- The entire group of assets is generating the income stream from the lease contract.

How we see it

The determination as to whether or not an item constitutes an integral part of an investment property requires judgement and will depend on the particular facts and circumstances. However, it is our view that in order for all the assets to be classified as investment property, all the conditions referred to above must be present.

This means that, in the case of Lease 1, if the entire group of assets is leased with the purpose of enabling the lessee to produce grapes and, subsequently, wine, the investment property comprises the land, the vineyard infrastructure, the winery building structures and the winery plant and machinery. The vineyard infrastructure (e.g., trellises as they are essential to support the vines) is integral to the investment property, as it is necessary in order for the property to function properly (it is necessary for growing the grapes). The winery plant and machinery (crushing equipment, distilling equipment) are also integral to the investment property, as plant and machinery are necessary to process the grapes in order to make wine. Vines, which meet the definition of biological assets, are subject to the requirements of Section 34 *Specialised Activities* and whilst vines are important assets to produce grapes, they are not integral for the main property and other assets to function properly. Further, under adopted IFRS, they are excluded because 'biological assets related to agricultural activity' are outside the scope of IAS 40. [IAS 40.4(a)].

In the case of Lease 2, if the entire group of assets is leased with the purpose of enabling the lessee to use the assets to operate them as a port, the investment property comprises all of the assets, i.e., the land, the warehouses, the transport infrastructure, the wharves, the light towers, and the specialised container cranes. This is because all the assets are necessary for the port to function as intended.

3.2 Measurement at initial recognition

Section 16 requires an investment property to be measured at its cost at initial recognition. The cost of purchased investment property comprises its purchase price and any directly attributable costs such as legal fees, brokerage fees, property transfer taxes and other transaction costs. The purchase price might be paid in cash or deferred beyond normal credit terms (see 3.2.1 below). For a self-constructed investment property, Section 16 requires the cost to be determined in accordance with paragraphs 10 to 14 of Section 17. [FRS 102.16.5].

How we see it

Although specific reference to Section 17 is made only when determining the cost of a self-constructed investment property (see above and 3.2.3 below), we consider that the principles in Section 17 must still be applied to the recognition of costs in Section 16, i.e., for both self-constructed property and completed property. This means that only those elements of cost that are allowed by Section 17 could be capitalised and that capitalisation ceases when the asset has reached the condition necessary for it to be capable of operating in the manner intended by management.

These recognition principles in Section 17, together with the discussions of other practical issues, are set out in detail in Chapter 20 at 3.3.3 and 3.4.

An investment property held by a lessee as a right-of-use asset is recognised in accordance with Section 20 (see 3.2.4 below). [FRS 102.16.6].

3.2.1 Deferred payments

In considering the purchase price, if payment for the property is deferred beyond normal credit terms, the present value of all future payments is calculated in order to arrive at the cost. [FRS 102.16.5]. Accordingly, any difference between the present value and the total payments to be made is recognised as interest expense over the credit period.

3.2.2 Initial measurement of assets acquired in exchange transactions

Unlike for a 'self-constructed' property (see 3.2.3 below), Section 16 is silent on how to measure the cost of a 'completed' investment property acquired in part or in whole in exchange for a non-monetary asset.

However, guidance is contained in Section 17 in respect of how to measure the cost of an item of PP&E in exchange for a non-monetary asset or assets, or a combination of monetary and non-monetary assets. This states that the cost of acquired asset is measured at fair value unless: [FRS 102.17.14]

- The exchange transaction lacks commercial substance.
- Or
- The fair value of neither the asset received nor the asset given up is reliably measurable. In that case, the asset's cost is measured at the carrying amount of the asset given up.

As discussed in 3.2 above, we consider that the principles in Section 17 must still be applied to the recognition of costs of acquired investment property in Section 16. Accordingly, an entity acquiring an investment property in exchange for a non-monetary asset or assets, or a combination of monetary and

non-monetary assets must follow the guidance in Section 17 as described above. Note that under the UK law, only profits realised at the balance sheet date may be included in the profit and loss account. [1 Sch 13(a)]. Therefore, any resulting gain or loss in the above exchange transactions is likely to be an unrealised profit or loss and would be reported in other comprehensive income to the extent that the consideration received does not meet the definition of a 'qualifying consideration' (such as investment property).

This guidance is further discussed in Chapter 20 at 3.4.4.

3.2.3 Self-constructed property

To determine the cost of a self-constructed investment property, Section 16 refers to the guidance in paragraphs 10 to 14 of Section 17 (see Chapter 20 at 3.4). [FRS 102.16.5]. This means that only those costs that are allowed by Section 17 can be capitalised and that capitalisation ceases when the asset has reached the condition necessary for it to be capable of operating in the manner intended by management.

Therefore, start-up costs (unless necessary to bring the property into working condition) and operating losses incurred before the investment property achieves the planned occupancy or rental income level are not to be capitalised because at the date of physical completion, the asset would be capable of operating in the manner intended by management. This is consistent with the principles in IAS 40. Also, consistent with IAS 40 and common practice, the cost of investment property is not increased by abnormal amounts of wasted material, labour, or other resources incurred in constructing or developing an investment property. [IAS 40.23].

In addition to the purchase price and costs directly attributable to bringing the property to the condition necessary for it to be capable of operating in the manner intended by management, the cost of a self-constructed investment property also comprises the initial estimate of costs, recognised and measured in accordance with Section 21 *Provisions and Contingencies*, of dismantling and removing the property and restoring the site on which it is located (see Chapter 24). If a self-constructed property meets the definition of a qualifying asset, its cost could also include any eligible borrowing costs capitalised in accordance with Section 25 *Borrowing Costs*, to the extent that the entity chooses to do so as an accounting policy choice (see Chapter 27). [FRS 102.17.10].

Paragraphs 11 to 14 of Section 17, referred to above, also provide guidance in determining which costs are not capitalisable, treatment of income and expenses of incidental operations during construction of a property, accounting for deferred payments and accounting for exchanges of assets when acquiring a property.

The above elements of cost are further discussed in Chapter 20 at 3.4.1 to 3.4.4.

3.2.3.A Cost of a building to be demolished in connection with the construction of a new building

It is not uncommon for property companies to acquire land with an existing building where the planned redevelopment requires the demolition of that building and its replacement with a new building that is to be held as investment property. In this case, the entity classifies the land and building on initial recognition as one item of investment property under Section 16 and measures the investment property based on its cost (see 3.2 above). [FRS 102.16.5]. Subsequently, the land and building are measured as one item at fair value at each reporting date (see 3.3 below). [FRS 102.16.7].

Entities holding investment properties may also decide to replace existing buildings with new ones and continue to hold these as investment properties. If an entity decides to replace an existing building with a new one but will continue to hold it as investment property, then the highest and best use of the land might not match the current use of the land. The value of the land may increase by constructing a different property (for example with more floors or with a different purpose). When determining the fair value of the investment property, the entity takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use (see 3.3.8 below). [FRS 102.2A.9]. Therefore, the existing building and land will be measured as one single asset based on its fair value. As the new building is constructed, the property (land and building) will continue to be measured as one single asset based on fair value from a market participant's perspective.

Entities replacing an existing building (accounted for as PP&E or inventory) with a building for their own use or a building to be sold in the ordinary course of their business will deal with the land and buildings under Section 17 (see Chapter 20 at 3.4.1.G) or Section 13 (see Chapter 16 at 3.2.14), respectively.

3.2.4 Initial measurement of property held under a lease

As discussed in 3.1.5 above, under Section 20, lessees apply a single model for most leases, i.e., unlike lessors, lessees do not need to classify leases as finance leases or as operating leases. Section 20 requires lessees to recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets (see Chapter 23).

An investment property held by a lessee as a right-of-use asset must be measured initially at its cost in accordance with Section 20 (see Chapter 23 at 6.2.1). [FRS 102.16.6]. The treatment of initial direct costs by a lessee applying Section 20 is discussed in section 3.2.9.B below.

3.2.5 Expenditure prior to planning permissions/zoning consents

In the UK, as well as in many jurisdictions, permissions from relevant authorities are required prior to development of new or existing property, and the ability to start physical construction of the development depends on these permissions.

Application for such permissions supports the entity's intention as to the use of the property and may be considered as a factor in classifying the asset. However, unless an entity is considering a number of possible uses of the asset at its initial recognition, the uncertainty in obtaining the relevant permission would usually not affect the classification of the property which, as set out in 3.1 above, is mainly based on the entity's intention when the property is first acquired. Subsequent to initial recognition, assets might be reclassified into and from investment property (see 3.4.2 below).

The likelihood of obtaining such permissions, however, is relevant in recognition and measurement of any additional costs to the property. Developers typically incur significant costs prior to such permissions being granted and such permissions are rarely guaranteed.

How we see it

In assessing whether pre-permission expenditure can be capitalised - assuming it otherwise meets the criteria - a judgement must be made, at the date the expenditure is incurred, of whether there is sufficient probability that the relevant permissions will be granted.

Conversely, if during the application and approval process of such permits it is no longer expected that necessary permits will be granted, capitalisation of pre-permission expenditure must cease and any related amounts that were previously capitalised and that will not be recovered in the future would be written off through determining the subsequent fair value of the property. Under the fair value model (see 3.3 below), it would not affect the measurement of the investment property in the statement of financial position; it would only affect presentation of write-off of expenses and fair value gains and losses in the income statement.

If, however, the property is measured at cost amount less impairment, e.g., due to the fact that the fair value of investment property can no longer be measured reliably (see 3.3.3 below), the carrying amount of any related property subject to development or redevelopment (or, if appropriate, the cash generating unit where such an asset belongs) must be tested for impairment, where applicable, in accordance with Section 27 *Impairment of Assets* (see Chapter 29).

3.2.6 Income from tenanted property during development

An entity may have acquired an investment property, which has been generating rental income, but subsequently intends to redevelop it with the same purpose of renting it out in the future. An issue that can arise is whether rental and similar income generated by existing tenants in a property development may be capitalised and offset against the cost of developing that property.

Section 17 requires that the income and related expenses of incidental operations are recognised in profit or loss and included in their respective classifications of income and expense (see Chapter 20 at 3.4.2). [FRS 102.17.12]. We consider that rental and similar income from existing tenants are incidental operations to the development. The existence of the tenant is not a necessary condition for the property to be developed to a state capable of operating in the manner intended by management; management could have developed the property in the absence of any existing tenants.

How we see it

In our view, there must not be a measurement difference between the cost of a property development dealt with under Section 16 and the cost of a property development dealt with under Section 17.

Therefore, rental and similar income generated by existing tenants in a property dealt with under Section 16 and now intended for redevelopment must not be capitalised against the costs of the development. Rather, rental and similar income are recognised in profit or loss in accordance with the requirements of Section 20 (see Chapter 23), together with any related expenses. For these purposes it is irrelevant whether the investment property is held at fair value, or in certain cases, at cost (see 3.3 below).

3.2.7 Payments by the vendors to the purchaser

In some instances, a transaction for the purchase of an investment property may include an additional element where the vendor repays fixed or variable amounts to the purchaser - e.g., when the vendor agrees to compensate the purchaser for specific transaction costs incurred or perhaps described as representing a rental equivalent for a period of time such as rental guarantees.

The question then arises whether, in the financial statements of the purchaser, these payments are recorded as income (albeit perhaps recognised over a period of time) or as a deduction from the acquisition cost of the investment property on initial recognition.

How we see it

In our view, such amounts described above are an integral part of the acquisition transaction and must invariably be treated as a deduction from the acquisition cost of the investment property because the payment is an element of a transaction between a vendor and purchaser of the property (rather than, for example, a landlord and tenant in respect of rental guarantees).

In the event that the repayments by the vendor are spread over time, the fair value of the right to receive those payments is deducted from the cost of the investment property and an equivalent financial asset is recognised. The financial asset would be accounted for in accordance with Section 11 *Basic Financial Instruments* and/or Section 12 *Other Financial Instruments Issues* which could lead to it being classified as financial asset at amortised cost or at fair value through profit or loss (see Chapter 13 at 6).

3.2.8 Acquisition of investment property or business combination

It is not uncommon for property companies to acquire a single investment property, with lease agreements with multiple tenants over varying periods and associated processes, such as cleaning, maintenance and administrative services such as rent collection. Further, the discussion in 3.1.3 above relates to 'ancillary services' and while these are often insignificant to the overall arrangement as to disqualify a property from being an investment property, these could nonetheless be considered 'processes' (see Chapter 22 at 3.2.2) that could result in the acquired set of activities constituting a business.

Therefore, judgement is required to determine whether the acquisition of investment property is an acquisition of an asset or a group of assets, or a business combination within the scope of Section 19.

[FRS 102.16.2A].

Consistent with IAS 40, it is worth clarifying that the discussion about 'ancillary services' in 3.1.3 above relates to whether or not a property is owner-occupied property or investment property and not to determining whether or not a property is a business as defined in Section 19. Determining whether a specific transaction meets the definition of a business combination as defined in Section 19 and includes an investment property as defined in Section 16 requires the separate application of both sections.

[FRS 102.16.2A]. Accordingly, reference must be made to Section 19 (see Chapter 22 at 3.2) to determine whether it is a business combination and this judgement will rest upon the facts and circumstances of each acquisition. If significant, disclosure of this judgement would be required by Section 8. [FRS 102.8.6].

Section 19 establishes different accounting requirements for a business combination as opposed to the acquisition of an asset or a group of assets that does not constitute a business (see 3.2.8.A below).

Therefore, determining whether an acquired investment property is a business or not, could result in significantly different accounting outcomes, both at the date of acquisition (i.e., at initial recognition) and subsequently. If dealt with as an acquisition of a business, then the initial accounting for investment property is considerably more complex. For example, amongst other requirements:

- Initial direct costs are expensed (Section 16 requires these to be capitalised - see 3.2 above).
- Deferred tax assets and liabilities are recognised if the transaction is a business combination, but not recognised if it is an asset acquisition.
- Goodwill (positive or negative) arises only on business combinations.

Judging whether an acquisition is a business combination or not is therefore of considerable importance.

How we see it

It will be a matter of judgement for preparers to conclude that, when applying the guidance in Section 19, if acquired processes are considered to be insignificant (whether by reference to guidance in IAS 40 as discussed in 3.1.3 above or otherwise) an investment property acquisition is within the scope of Section 16 rather than Section 19. This judgement will rest upon the facts and circumstances of each acquisition. If significant, disclosure of this judgement would be required by Section 8.

The definition of a business is applied regardless of whether the entity purchases a property directly or, in the case of consolidated financial statements, via the shares in another entity.

See Chapter 22 at 3.2 for the detailed guidance in determining whether an acquisition of an integrated set of activities and assets meets the definition of a business combination.

3.2.8.A Acquisition of a group of assets that does not constitute a business ('the group')

The purchase price of an investment property may result from an allocation of the price paid for a group of assets. However, Section 19 applies only to business combinations - therefore if the group of assets is not a business, Section 19 does not apply, nor does it specify how to account for a group of assets. The initial recognition and measurement of the assets acquired will depend on the nature of the particular assets and the requirements of FRS 102 for such assets. Many assets, such as PP&E, investment property, intangible assets or inventories, are required to be measured initially at cost. Therefore, it will be necessary to make some apportionment of the overall cost of the group of assets to the individual assets.

How we see it

One possible approach to making such an allocation would be to apply the guidance in paragraph 2(b) of IFRS 3 *Business Combinations* for the acquisition of a group of assets that is not a business (see Chapter 22 at 3.1). In such cases the acquirer must identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, intangible assets in Section 18 *Intangible assets other than Goodwill*) and liabilities assumed and allocate the cost of the group to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase.

There may be other approaches, however, whatever approach is used to allocate the overall cost to the individual assets or liabilities, no goodwill arises since goodwill (positive or negative) is recognised only in a business combination.

When applying the principles of IFRS 3, it is also worth noting that the IFRS IC noted the requirement of paragraph 2(b) of IFRS 3 as described above and also noted that other IFRS accounting standards include initial measurement requirements for particular assets and liabilities (e.g., IFRS 9 *Financial Instruments* for financial instruments).

The IFRS IC observed that if an entity initially considers that there might be a difference between the sum of individual fair values of the identifiable assets and liabilities and the transaction price, the entity first reviews the procedures it has used to determine those individual fair values to assess whether such a difference truly exists before allocating the transaction price. The IFRS IC then considered two possible ways of accounting for the acquisition of the group of assets.

Under the first approach an entity:

- Identifies the individual identifiable assets acquired and liabilities assumed that it recognises at the date of the acquisition.
 - Determines the individual transaction price for each identifiable asset and liability by allocating the cost of the group based on the relative fair values of those assets and liabilities at the date of the acquisition.
- And then
- Applies the initial measurement requirements in applicable standards to each identifiable asset acquired and liability assumed. The entity accounts for any difference between the amount at which the asset or liability is initially measured and its individual transaction price applying the relevant requirements.

Applying the second approach, for any identifiable asset or liability initially measured at an amount other than cost, an entity initially measures that asset or liability at the amount specified by the applicable standard. The entity deducts from the transaction price of the group the amounts allocated to the assets and liabilities initially measured at an amount other than cost and then allocates the residual transaction price to the remaining identifiable assets and liabilities based on their relative fair values at the date of acquisition.

The IFRS IC concluded that a reasonable reading of the requirements in paragraph 2(b) of IFRS 3 on the acquisition of the group results in one of the two approaches outlined above (i.e., a policy choice) and that an entity would apply its reading of the requirements consistently to all acquisitions of a group of assets that does not constitute a business.⁹⁷

If material, disclosure of accounting policy information on acquisition of a group of assets that is not a business and significant judgement made in applying such accounting policy would be required by Section 8. [FRS 102.8.5, FRS 102.8.6].

3.2.9 Lease incentives and initial direct costs of leasing a property

In negotiating a new or renewed operating lease, the lessor may provide incentives for the lessee to enter into the agreement. The lessor or the lessee (or both) may also incur costs that are directly attributable to negotiating and arranging a lease. However, Section 16 provides no specific guidance on accounting for lease incentives and initial costs of obtaining a lease.

3.2.9.A Lease incentives

Lease incentives are defined as payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee. [FRS 102 Appendix I].

In practice, examples of such incentives are an up-front cash payment to the lessee or the reimbursement or assumption by the lessor of costs of the lessee (such as relocation costs, leasehold improvements and costs associated with a pre-existing lease commitment of the lessee). Alternatively, initial periods of the lease term may be agreed to be rent-free or at a reduced rent.

Under Section 20, lease incentives are deducted from 'lease payments' made by a lessee to a lessor relating to the right to use an underlying asset during the lease term. [FRS 102 Appendix I]. Accordingly, for lessees, lease incentives that are received by the lessee at or before the lease commencement date reduce the initial measurement of a lessee's right-of-use asset. [FRS 102.20.47(b)]. Lease incentives that are receivable by the lessee at lease commencement date reduce a lessee's lease liability (and therefore the right-of-use asset as well). [FRS 102.20.51(a)].

For lessors, lease incentives that are paid or payable to the lessee are also deducted from lease payments. Lease payments under operating leases are recognised by lessors as income on either a straight-line basis or another systematic basis. [FRS 102.20.106]. Accordingly, for operating leases, lessors defer any lease incentives paid or payable to the lessee and recognise the resulting accrual as a reduction to lease income over the lease term in order to recognise the lease payments as income at an amount that is net of lease incentives. This means that such accrued rental income will be recovered as part of the cash payments to be received from the lessee over the remaining lease term.

The accounting for lease incentives applied in practice by lessors of investment property is illustrated below.

Illustration 3-2: Lessor accounting for lease incentives under Section 16

On 1 January 20X5, an investor acquires a property with an acquisition cost of £80 million, which is assumed to be its fair value at the date of acquisition. On the same day, the investor leases the property under an operating lease to a lessee with a five-year term. The market rent for such a property is assessed to be £4 million per annum, representing a yield of 5%. The lessor and lessee agree to the following lease payments and conditions:

- Year 1 (20X5): rent free
- Year 2: £5 million
- Year 3: £5 million
- Year 4: £5 million
- Year 5: £5 million

⁹⁷ [IFRIC Update](#), November 2017, available on the IFRS Foundation's website.

The rent for years 2 to 5 is paid at the beginning of each year. As the lease incentive (the rent-free period) is an integral component of the lease agreement it is assumed that, in exchange for the rent-free period, the lessee provides a flow of lease rental payments to the lessor in years 2 to 5 that are higher than what they would be if no incentive was provided.

Assume that the rent-free period is taken into account by the appraiser in arriving at the fair value of the property on the date of acquisition. In the example, the fair value of the investment property as at 31 December 20X5 (end of year 1) and 31 December 20X6 (end of year 2) is assumed to be £82 million.

There are two acceptable approaches for a lessor of investment property to account for lease incentive (e.g., a rent-free period):

Approach A

The investment property is recorded at fair value (e.g., based on the expected cash flows). On the basis that the property is to be recorded at its fair value, the lease payments according to the operating lease contract are taken into account by the valuer in arriving at the fair value of the property. As the lease incentive is related to the consideration for the use of the asset, it affects the rental income as presented in the income statement. The lessor would record the following journal entries ('JE') in 20X5 and 20X6:

Extracts from the ledgers for the years ended 31 December 20X5 and 20X6

(All figures in £ millions)

	20X5				20X6			
	As at 1 Jan 20X5	JE (1)	JE (2)	JE (3)	As at 31 Dec 20X5	JE (4)	JE (5)	As at 31 Dec 20X6
Balance sheet								
Investment property	-	80	2	-	82	-	-	82
Cash	80	(80)	-	-	-	5	-	5
Net Assets	80	-	2	-	82	5	-	87
Share capital	80	-	-	-	80	-	-	80
Retained earnings	-	-	-	-	-	-	-	2
Net income	-	-	2	-	2	5	-	5
Total Equity	80	-	2	-	82	5	-	87

Income statement

Gains or (losses) from fair value adjustments	-	-	2	(4)	(2)	-	1	1
Rental income	-	-	-	4	4	5	(1)	4
Net income	-	-	2	-	2	5	-	5

Reconciliation of the carrying amount of the investment property

Net book value	78	79
Plus: tenant lease incentives	4	3
Market value	82	82

Journals:

- (1) Paragraph 5 of Section 16 requires investment property to be measured initially at its cost (see 3.2 above), which is £80 million in the fact pattern.
- (2) At the balance sheet date, the investment property must be measured at fair value in accordance with Section 2A, which is £82 million. The change in fair value is recognised in profit and loss. See 3.3 below for further discussions on subsequent measurement of an investment property under the fair value model.

- (3) In line with paragraph 3 of Section 2A, the fair value measurement reflects 'assumptions that market participants would use when pricing the asset'. A market participant, using an income approach to value its investment property, would consider the expected cash flows that the lessee will pay. It will not consider income recognised in prior periods associated with the lease incentive. As such, the expected future cash flows are taken into account in determining the fair value of the investment property.
- Appendix I to FRS 102 notes that lease payments are "Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term, comprising the following: (a) fixed payments (including in-substance fixed payments), less any lease incentives...". Paragraph 106 of Section 20 states that "A lessor shall recognise lease payments from operating leases as income on a straight-line basis, unless either: (a) another systematic basis is more representative of the pattern in which benefit from the use of the underlying asset is diminished; or (b) the lease payments are structured to increase in line with expected general inflation (based on published indices or statistics) to compensate for the lessor's expected inflationary cost increases. If the lease payments vary according to factors other than general inflation, then this condition is not met."
- Therefore, in order to recognise the lease payments from operating leases (including any deductions related to lease incentives) as income on a straight-line basis, the total rental income over the period of the lease (£20 million) is apportioned evenly over the five-year period: rental income of £4 million is recognised each year.
- (4) The cash received of £5 million for the second year of the lease term is recorded.
- (5) To continue to recognise the rental income in accordance with Section 20, an entry is made reducing the rental income to the appropriate amount (i.e., £4 million in the fact pattern). The offsetting entry is to the gain or loss from change in fair value of the investment property.

Approach B

A separate asset is recorded to straight line the cost of the consideration in the form of the lease incentive (rent-free period) over the term of the lease. To avoid double-counting, the lessor adjusts the carrying amount of the investment property downwards to take into account the fact that the actual return to the lessor will be lower because the lessor has agreed to offer a rent-free period and has recorded this lease incentive separately as an asset:

Extracts from the ledgers for the years ended 31 December 20X5 and 20X6

(All figures in £ millions)

	20X5					20X6

Income statement

Gains or (losses) from fair value adjustments	-	-	2	(4)	-	(2)	-	-	1	1
Rental income	-	-	-	4	-	4	5	(1)	-	4
Net income	-	-	2	-	-	2	5	(1)	1	5

Journals:

(1), (2) and (3) are the same as in Approach A above.

- (4) Discussion in 3.3.2.B below specifies that in determining the carrying amount of investment property at fair value, an entity does not double-count assets or liabilities that are recognised as separate assets or liabilities. For example, the fair value of investment property excludes prepaid or accrued operating lease income, because the entity recognises it as a separate liability or asset. Therefore, a reclassification is made to separate the other asset (i.e., lease incentive) that arises from straight-lining the lease payments from the investment property.
- (5) The cash received of £5 million for the second year of the lease term is recorded.
- (6) To continue to recognise the rental income in accordance with Section 20, the decrease of the carrying amount of the separate asset that arises from straight-lining the lease incentive is recognised as reduction of rental income over the lease term.
- (7) At the end of 20X6 the fair value of the investment property in the fact pattern is £82 million. The combined carrying amount of the investment property and separately recognised lease incentive asset is £81 million. Therefore, in order to continue to measure the investment property at fair value in accordance with paragraph 7 of Section 16 and the discussion in 3.3.2.B below, an increase in the fair value of the investment property of £1 million is recognised as a gain from fair value adjustments.

How we see it

Approach A and Approach B discussed above, in our view, are both acceptable approaches when accounting for lease incentives provided to lessees and thus, either can be applied as a matter of accounting policy choice. Such policy choice is applied consistently and if considered material to users of the financial statements, disclosure would be required by Section 8.

Consequently, some lessors present any accrued rental income (i.e., outstanding unamortised deferred lease incentives) as a separate asset, but other lessors present these together with (or as part of) the related investment property - see Illustration 3-2 above. However, lease incentives do not form part of the cost of the investment property (see also 3.3.6.A below for the discussion of adjusting the fair value of an investment property to avoid 'double counting' in circumstances where a lease incentive exists and is recognised separately). It is therefore relevant to distinguish between lease incentives and other capital expenditure.

There is no additional guidance in Section 20 to assist in the identification of incentives, but a similar requirement existed in previous United Kingdom GAAP (in Urgent Issues Task Force ('UITF') abstract 28 *Operating lease incentives*) and provides helpful additional detail:

"A payment (or other transfer of value) from a lessor to (or for the benefit of) a lessee should be regarded as a lease incentive when that fairly reflects its substance. A payment to reimburse a lessee for fitting-out costs should be regarded as a lease incentive where the fittings are suitable only for the lessee and accordingly do not add to the value of the property to the lessor. On the other hand, insofar as a reimbursement of expenditure enhances a property generally and causes commensurate benefit to flow to the lessor, it should be treated as reimbursement of expenditure on the property. For example, where the lifts in a building are to be renewed and a lease has only five years to run, a payment made by the lessor may not be an inducement to enter into a lease but payment for an improvement to the lessor's property."⁹⁸

For further discussions on lease incentives, see Chapter 23 at 5.5.2, 6.2.1 and 6.2.2.

98 UITF abstract 28 - Operating lease incentives, UK Accounting Standards Board, February 2001, para. 3.

3.2.9.B Initial direct costs of obtaining a lease

Lessors and lessees apply the same definition of initial direct costs.

Appendix I to FRS 102 defines initial direct costs as “Incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained ...”. [FRS 102 Appendix I]. Examples of such costs are commissions and contingent fees that would not have been incurred if the lease had not been obtained. Accordingly, in addition to excluding allocated costs (e.g., salaries), initial direct costs exclude costs incurred regardless of whether the lease is successfully finalised (e.g., fees for certain legal advice, estate agent fees not contingent upon success). Certain payments made by a lessee to an existing tenant to incentivise that tenant to terminate its lease could also be regarded by the lessee as initial direct costs incurred to obtain a new lease.

Under Section 20, lessors are required to add initial direct costs incurred in obtaining an operating lease to the carrying amount of the underlying asset. These initial direct costs are recognised as an expense over the lease term on the same basis as lease income. [FRS 102.20.108]. For lessees, Section 20 requires initial direct costs to be included in the initial measurement of the right-of-use asset. [FRS 102.20.47].

While Section 16 does not contain specific guidance on the accounting treatment of initial direct costs of arranging leases over a property (e.g., legal and agency fees), due to the requirements of Section 20 mentioned above, such costs must be recognised as an expense over the term of the resultant lease.

This means, if the property is carried at cost amount less impairment, e.g., due to the fact that the fair value of investment property can no longer be measured reliably (see 3.3.4 below), such costs are presented as part of the cost of the investment property, even if they do not strictly form part of it and are then amortised separately over the lease term.

An entity using the fair value model must also initially include these costs as part of the carrying amount of the investment property. However, at the next reporting date such initial costs could be recognised in profit and loss in the reported fair value gain or loss, as they would otherwise exceed the fair value of the related investment property. This is consistent with the treatment of transaction costs incurred on acquisition of a property discussed in 3.3.5 below.

Alternatively, under the fair value model, we also believe that the initial direct costs included in the carrying amount of the investment property could be recognised subsequently as an expense over the lease term on the same basis as the lease income. Accordingly, the amortisation of the initial direct costs is presented separately from the gain or loss from fair value adjustments on investment property. In addition, the gain or loss on fair value adjustments is credited by the same amount as the amortisation charge in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is equal to its fair value at each reporting date.

The accounting for initial direct costs of operating leases applied in practice by lessors of investment property is illustrated below.

Illustration 3-3: Lessor accounting for initial direct costs of operating leases under Section 16

On 1 January 20X5, an investor acquires a property at a cost of £100 million. On the same day, the investor leases the property under an operating lease to a lessee with a five-year term for a yearly rent of £5 million. The lessor incurs legal fees of £4 million in arranging the lease contract. According to an appraisal by an independent valuer, the fair values of the property as at 31 December 20X5 and 31 December 20X6 is £100 million.

There are two acceptable approaches for a lessor of investment property to account for initial direct costs of operating leases:

Approach A

On acquisition, the initial direct costs would be capitalised into the investment property, but subsequently, they are expensed through the change in the fair value of the investment property.

The lessor would record the following journal entries (‘JE’) in 20X5 and 20X6 (time value of money is ignored):

Extracts from the ledgers for the years ended 31 December 20X5 and 20X6

(All figures in £ millions)

	20X5					20X6		
	As at 1 Jan 20X5	JE (1)	JE (2)	JE (3)	JE (4)	As at 31 Dec 20X5	JE (5)	As at 31 Dec 20X6
Balance sheet								
Investment property	-	100	4	-	(4)	100	-	100
Cash	100	(100)	(4)	5	-	1	5	6
Net Assets	100	-	-	5	(4)	101	5	106
Share capital	100	-	-	-	-	100	-	100
Retained earnings	-	-	-	-	-	-	-	1
Net income	-	-	-	5	(4)	1	5	5
Total Equity	100	-	-	5	(4)	101	5	106
Income statement								
Gains or (losses) from fair value adjustments	-	-	-	-	(4)	(4)	-	-
Rental income	-	-	-	5	-	5	5	5
Net income	-	-	-	5	(4)	1	5	5

Journals:

- Paragraph 5 of Section 16 states that an investment property is measured initially at its cost and transaction costs are included in the initial measurement (see 3.2 above).
- Section 16 does not contain specific guidance on the accounting treatment of initial direct costs that are incurred in arranging a lease contract for an investment property that is measured at fair value. Therefore, it seems appropriate to apply the guidance for the accounting of initial direct costs incurred by a lessor under an operating lease that is included in Section 20. Paragraph 108 of Section 20 requires a lessor to add initial direct costs incurred in obtaining an operating lease to the carrying amount of the underlying asset and recognise those costs as an expense over the lease term on the same basis as the lease income. Initial direct costs (e.g., legal fees) would initially be added to the carrying amount of the investment property when incurred, similar to transaction costs discussed in paragraph 5 of Section 16 (see 3.2 above). Therefore, the initial direct costs of £4 million must be added to the carrying amount of the investment property.
- The rental income for the first year of the lease term (£5 million) is recognised.
- Subsequently, the investment property, which includes the initial direct costs, is measured at fair value. Appendix I to FRS 102 defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Paragraph 7 of Section 16 refers to Section 2A and paragraph 8 of Section 2A requires that the price in the principal (or most advantageous) market used to measure the fair value of the asset or liability must not be adjusted for transaction costs. Therefore, the subsequent measurement of the investment property would exclude transaction costs.
In order to adjust the investment property to its fair value (£100 million), an adjustment of £4 million is recognised in profit and loss as required by paragraph 7 of Section 16.
- The cash received of £5 million for the second year of the lease term is recorded.

Approach B

On acquisition, the initial direct costs, generally, are added to the carrying amount of the leased asset and subsequently recognised as an expense over the lease term on the same basis as the lease income. The amortisation of the initial direct costs is presented separately from the gain or loss from fair value adjustments. In addition, the gain or loss on fair value adjustments is credited by the same amount as the

amortisation charge in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is equal to its fair value at each reporting date.

The lessor would record the following journal entries ('JE') in 20X5 and 20X6 (time value of money is ignored):

Extracts from the ledgers for the years ended 31 December 20X5 and 20X6

(All figures in £ millions)

Balance sheet	20X5						20X6			
	As at 1 Jan 20X5	JE (1)	JE (2)	JE (3)	JE (4)	JE (5)	As at 31 Dec 20X5	JE (6)	JE (7)	As at 31 Dec 20X6
Investment property	-	100	4	-	(4)	-	100	-	-	100
Cash	100	(100)	(4)	5	-	-	1	5	-	6
Net Assets	100	-	-	5	(4)	-	101	5	-	106
Share capital	100	-	-	-	-	-	100	-	-	100
Retained earnings	-	-	-	-	-	-	-	-	-	1
Net income	-	-	-	5	(4)	-	1	5	-	5
Total Equity	100	-	-	5	(4)	-	101	5	-	106

Income statement

Gains or (losses) from fair value adjustments	-	-	-	-	(4)	0.8	(3.2)	-	0.8	0.8
Amortisation of initial direct costs	-	-	-	-	-	(0.8)	(0.8)	-	(0.8)	(0.8)
Rental income	-	-	-	5	-	-	5	5	-	5
Net income	-	-	-	5	(4)	-	1	5	-	5

Journals:

(1), (2), (3) and (4) are the same as in Approach A above.

(5) According to paragraph 108 of Section 20 and paragraph 7 of Section 16, in order to recognise initial direct costs as an expense over a five-year term on a straight-line basis, the total amount of initial direct costs (£4 million) is apportioned evenly over the five-year period and thus, an amortisation expense of £0.8 million is recognised each year. It is appropriate to present this separately from the gain or loss from fair value adjustments.

The gain or loss on fair value adjustments is credited by the same amount as the amortisation expense in each period to ensure that the carrying amount of the investment property (including the unamortised initial direct costs) is stated at fair value at reporting date.

(6) The cash received of £5 million for the second year of the lease term is recorded.

(7) To continue to recognise amortisation of initial direct costs and the investment property at its fair value at each reporting date, as required by paragraph 108 of Section 20 and paragraph 7 of Section 16, respectively, reclassifications of the appropriate amounts based on the amortisation expense are made at each reporting date (i.e., £0.8 million in the fact pattern).

How we see it

Approach A and Approach B discussed above, in our view, are acceptable approaches when accounting for initial direct costs of operating leases and thus, either can be applied as a matter of accounting policy choice. Such policy choice is applied consistently and if considered material to users of the financial statements, disclosure would be required by Section 8.

For further discussions on initial direct costs of obtaining a lease, see Chapter 23 at 5.7.1 and 5.7.2.

3.2.10 Variable and contingent consideration

The terms of purchase of investment property may sometimes include a variable or contingent amount that cannot be determined at the date of acquisition. For example, the vendor may have the right to additional consideration from the purchaser in the event that a certain level of income is generated from the property; or its value reaches a certain level; or if certain legislative hurdles, such as the receipt of zoning or planning permission, are achieved.

The two key issues with regards to the accounting for variable or contingent consideration in an asset purchase are 1) whether and when to recognise a liability for that variable or contingent consideration, and 2) whether subsequent changes to the estimate of that variable or contingent consideration are accounted for as part of the cost of the acquired asset.

Section 16 has no explicit guidance on the treatment of variable or contingent payments to be incurred in connection with the purchase of investment property. As discussed in section 3.2 above, the principles in Section 17 relating to determining the attributable costs in an asset purchase apply to the recognition of costs in Section 16. Accordingly, for the detailed discussions of key accounting considerations related to the treatment of variable or contingent payments in an asset purchase, including the general approaches applied in practice, see Chapter 20 at 3.4.1.I.

How we see it

Consistent with the discussions in Chapter 20 at 3.4.1.I, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. In doing so, entities will need to apply the hierarchy in Section 10 (see Chapter 9 at 3.1). The policy selected must result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

Where the accounting for variability or contingency is not prescribed in another section in FRS 102 (see Chapter 20 at 3.4.1.I), an entity must adopt and apply a consistent accounting policy in relation to whether subsequent payments or subsequent changes to the measurement of a recognised liability to make variable or contingent payments are included as part of the cost of the acquired asset (e.g., investment property) or expensed as incurred, in accordance with the hierarchy in Section 10. An entity must exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in its particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information must be disclosed.

Of course, for investment property held at fair value, capitalising or expensing the remeasurements of any liability recognised for the variable or contingent consideration primarily affects classification within the income statement.

It is important to note that developing a policy (as described above) is not available for the contingent costs of acquiring investment property as part of a business combination. The treatment of contingent costs in these circumstances is described in Chapter 22 at 3.6.2.

3.2.11 Other aspects of cost recognition - repairs and maintenance

As discussed in 3.2 above, we consider that the principles in Section 17 must still be applied to the recognition of costs in Section 16. This means that only those elements of cost that were allowed by Section 17 could be capitalised and that capitalisation ceases when the asset has reached the condition necessary for it to be capable of operating in the manner intended by management.

Section 17 contains guidance on accounting for repairs and maintenance (see Chapter 20 at 3.3.3). Accordingly, day-to-day servicing, by which is meant the repairs and maintenance of the property which largely comprises labour costs, consumables and minor parts, are recognised in profit or loss as incurred. [FRS 102.17.15]. However, the treatment is different if large parts of the properties have been replaced, e.g., interior walls that are replacements of the original walls. In this case, the cost of replacing the original part will be recognised at the time that cost is incurred if the recognition criteria are met, while the carrying amount of the original part is derecognised (see 3.5.3 below and Chapter 20 at 3.3.3.A). [FRS 102.17.6].

The inference is that by restoring the asset to its originally assessed standard of performance, the new part will meet the recognition criteria and future economic benefits will flow to the entity once the old part is replaced. The inference is also that replacement is needed for the total asset to be operative. This being the case, the new walls will therefore meet the recognition criteria, and the cost will therefore be capitalised.

Other than interior walls, large parts that might have to be replaced include elements such as lifts, escalators and air conditioning equipment.

3.3 Measurement after initial recognition

Once recognised, an investment property must be measured at fair value at each reporting date (except in the cases described in 3.1.2 and 3.1.7 above, and in 3.3.3 below) with changes in fair value recognised in profit or loss. When a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it measures the right-of-use asset, and not the underlying property, at fair value.

[FRS 102.16.7]. See 3.3.1 and 3.3.2 below for discussions on determining the fair value of an investment property.

The FRC's appendix on the legal requirements of FRS 102 clarifies that fair value movements on investment properties can be included in the profit and loss account under paragraph 40 of Schedule 1 of the Regulations despite the fact that unrealised gains on investment properties are not usually realised profits as defined by the Companies Act. [FRS 102.A3.27].

Although the default reserve within equity for fair value movements on investment property is retained earnings, the FRC observed that entities measuring investment properties at fair value may transfer such amounts to a separate non-distributable reserve, instead of a transfer to retained earnings, but are not required to do so. Presenting fair value movements that are not distributable profits in a separate reserve may assist with the identification of profits available for that purpose. [FRS 102.A3.28]. Any such transfer from retained earnings to a non-distributable reserve is made in the statement of changes in equity.

Unless carried under the cost model in Section 17 or Section 20 in certain cases as discussed at 3.1.2 and 3.1.7 above, no depreciation is required on investment properties as the Regulations do not require depreciation of investment properties measured under the fair value accounting rules.

Section 16 permits an entity to subdivide investment property into classes such that some classes may be measured at cost, and others at fair value (for example, investment property rented to another group entity - see 3.1.2 above). The FRC's appendix on the legal requirements of FRS 102 takes the view that such requirement that allows certain class of investment property to be held at fair value and other class of such items at cost is 'consistent with the most reasonable and common sense interpretation' of paragraph 39 of Schedule 1 of the Regulations which permits investment property to be included at fair value provided that the fair value can reliably be determined. [FRS 102.A3.37D].

3.3.1 The fair value model

Under Section 16, an investment property is measured at its fair value at the end of the reporting period and a gain or loss arising from changes in the fair value in the reporting period is recognised in profit or loss for that period. Section 16 also emphasises that when a lessee uses the fair value model to measure an investment property that is held as a right-of-use asset, it measures the right-of-use asset, and not the underlying property, at fair value. [FRS 102.16.7].

Appendix I to FRS 102 defines fair value as 'the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date'.

[FRS 102 Appendix I]. Section 16 refers to the guidance on determining fair value in Section 2A. [FRS 102.16.7]. Section 2A provides a fair value measurement framework that applies whenever fair value measurement is permitted or required. Section 2A does not specify when an entity is required to use fair value, but rather, provides guidance on how to measure fair value under FRS 102 when fair value is required or permitted by a section in FRS 102. See Chapter 10 for the detailed discussion of such guidance.

The definition of fair value described above and the guidance on fair value measurement in Section 2A are aligned with IFRS 13. [FRS 102.BC.B2A.2].

How we see it

While entities cannot presume this always to be the case, in practice, the fair value estimate arrived at under Section 2A may be similar to that estimated for 'market value' as defined by the Royal Institution of Chartered Surveyors ('RICS') and the International Valuation Standards Council ('IVSC'). Their definition of 'market value' being "the estimated amount for which an asset and/or liability should exchange on the valuation date between a willing buyer and a willing seller in an arm's-length transaction, after proper marketing and where the parties had each acted knowledgeably, prudently and without compulsion".⁹⁹

The price in the market (either in the principal or most advantageous market) used to measure fair value must not be adjusted for transaction costs. This is because transaction costs are not a characteristic of an asset or a liability; rather, they are specific to a transaction. [FRS 102.2A.8]. They will differ depending on how an entity enters into a transaction for the asset or liability.

Transaction costs incurred by a purchaser on acquisition are dealt with in 3.3.5 below and in Chapter 10 at 4.7.1.

3.3.2 Estimating fair value

Many entities use an external valuer to estimate fair value based on the RICS and/or IVSC Valuation Standards. In practice, the use of an independent valuer with a recognised and relevant professional qualification and with recent experience in the location and category of the investment property being valued is generally preferred by many entities over valuations prepared in-house, albeit there is no requirement for an entity to use an independent valuer in determining the fair value of investment property. However, if there has been no such independent valuation, this must be disclosed (see 4.3 below). [FRS 102.16.10(b)].

How we see it

Management needs to be aware of the conceptual differences between Section 2A and International Valuation Standards to ensure any values used for financial reporting that are obtained from appraisals, whether external or internal, are consistent with the objective of fair value measurement in accordance with Section 2A.

Although an appraisal is normally undertaken by professionally qualified and experienced independent valuers, an appraiser does not need to be independent of the reporting entity. If the internal appraisals are of such a quality that the fair values of investment property are reliably measured in accordance with Section 2A (see 3.3.3 below), then no additional appraisals by an independent valuer are required.

How we see it

We acknowledge that a fair value measured by the entity itself may be less reliable than a fair value measured by an independent valuer. However, we believe that the users of financial statements are made aware of this potential weakness and its possible impact on a true and fair presentation by the disclosure requirements in paragraph 10(b) of Section 16 which requires disclosures to be made about the extent of involvement of independent valuers in measuring fair values (see 4.1 below).

When estimating the fair value of the property in accordance with Section 2A, the objective is to estimate the price that would be received to sell an investment property in an orderly transaction between market participants at the measurement date under current market conditions. [FRS 102.2A.2, FRS 102.2A.4]. This objective applies regardless of the techniques and inputs used to measure fair value (see 3.3.2.A below).

Under adopted IFRS, IAS 40 has certain requirements in addition to those in IFRS 13. In particular, IAS 40 requires that the fair value reflects, among other things, rental income from current leases and other assumptions that market participants would use when pricing investment property under current market conditions. [IAS 40.40]. For example, in a transaction to sell an investment property, it is likely that market participants would consider the existing lease agreements in place.

⁹⁹ IVS 102 Bases of Value, International Valuation Standards, IVSC, effective 31 January 2025, Appendix: IVS-Defined Basis of Value, para. A10.01, p.24.

This is consistent with the general requirement in Section 2A and in IFRS 13 that an entity must measure the fair value using the assumptions that market participants would use when pricing the asset or liability, assuming that market participants act in their economic best interest. [FRS 102.2A.2, IFRS 13.22].

Section 20 specifies the basis for initial recognition of the cost of an investment property held by a lessee as a right-of-use asset (see 3.2.4 above). In line with the discussion in 3.3.1 above, an investment property held by a lessee as a right-of-use asset is remeasured to fair value and that the right-of-use asset, and not the underlying property, will be measured at fair value. [FRS 102.16.7]. Generally, the determination of the fair value of right-of-use assets is relatively straightforward if the sublease does not contain any options or variable lease payments. Determining the fair value would involve projecting the cash flows that the entity expects to receive from subleasing the asset and these cash flows would also normally be relatively straightforward because it is likely that a sublease would already be in place.

If leases have variable and optional payments, or if there is no active market for the right-of-use asset, the principles in Section 2A must be sufficient to help lessees to measure the fair value of those right-of-use assets. It is also reasonable to consider the guidance in paragraph 50(d) of IAS 40 which explains when to include in the measurement of the right-of-use asset options and variable lease payments that are not included in the measurement of the lease liability. Paragraph 50(d) of IAS 40 states that the fair value of investment property held by a lessee as a right-of-use asset reflects expected cash flows, including variable lease payments that are expected to become payable. Accordingly, if a valuation obtained for a property is net of all payments expected to be made, it will be necessary to add back any recognised lease liability, to arrive at the carrying amount of the investment property using the fair value model (see 3.3.7 below).

[IAS 40.50].

When lease payments are at market rates, the fair value of an investment property held by a lessee as a right-of-use asset at acquisition, net of all expected lease payments (including those relating to recognised lease liabilities), must be zero. Thus, remeasuring a right-of-use asset from its initial cost in accordance with Section 20 to fair value (taking into account the discussion in 3.3.2.B below) must not give rise to any initial gain or loss, unless fair value is measured at different times. This could occur when an election to apply the fair value model is made after initial recognition (e.g., for investment property leased to other group entity - see 3.1.2 above).

3.3.2.A Methods of estimation

Section 2A requires an entity to use the following order of methodology in estimating the fair value of an asset: [FRS 102.2A.15]

Extract from Section 2A

- 2A.15** The entity shall use valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value, maximising the use of inputs determined by reference to a market price in an active market. An entity shall use the following methodology to estimate fair value:
- (a) The best evidence of fair value is an unadjusted quoted price for an identical or comparable asset or liability in an active market at the measurement date.
 - (b) When an unadjusted quoted price is not available, the price of a recent orderly transaction between market participants for an identical or comparable asset or liability provides evidence of fair value. However, this price may not be a reliable estimate of fair value if there has been a significant change in economic circumstances or a significant period of time between the date of the transaction, and the measurement date.
 - (c) If neither (a) nor (b) above are available or reliable, the fair value shall be estimated using another valuation technique. The objective of using another valuation technique is to estimate the price at which an orderly transaction to sell an asset or to transfer a liability would take place between market participants at the measurement date.

An 'active market' is defined as a market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis. [FRS 102 Appendix I].

How we see it

In our view, it would be rare for real estate to be in methodology (a) above (i.e., an unadjusted quoted price) in estimating its fair value, as typically, there are no active markets for identical real estate assets (due to the uniqueness of each real estate asset).

In market conditions where similar real estate is actively purchased and sold, and the transactions are observable, the fair value measurement might be in methodology (b) above. This methodology will be unusual for real estate, but that determination will depend on the facts and circumstances.

Accordingly, the use of another valuation technique (i.e., methodology (c) above) is likely to be much more common for estimating fair value of real estate.

An entity must use valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value. [FRS 102.2A.15]. Section 2A does not specify or rank the techniques an entity must use to measure fair value. However, it requires them to be consistent with one or more of the three broad approaches: the market approach; the cost approach; and the income approach. [FRS 102.2A.16]. When selecting the most appropriate inputs to a valuation technique from multiple available inputs, those that maximise the use of inputs determined by reference to a market price in an active market, must be selected. [FRS 102.2A.15]. That is, Section 2A requires an entity to prioritise observable inputs over unobservable inputs.

Valuation techniques used to measure fair value must be applied consistently. However, Section 2A states that a change in a valuation technique or its application is appropriate if the change results in a measurement that is equally or more representative of fair value in the circumstances. This may be the case, for example, if new markets develop or new information becomes available. Revisions resulting from such a change in the valuation technique used or in its application are accounted for as a change in accounting estimate in accordance with Section 10 (see Chapter 9 at 3.4). In this case, an entity is not required to provide the disclosures required by paragraph 18 of Section 10. [FRS 102.2A.17].

See Chapter 10 at 4.11 for further discussion on selecting appropriate valuation techniques and inputs.

3.3.2.B 'Double-counting' of assets and liabilities

Unlike in IAS 40, Section 16 does not explicitly address the potential for double-counting assets and liabilities that are recorded separately in the statement of financial position, but also included within a valuation of an investment property. Common situations where this might otherwise happen are as follows:

- Equipment, fixtures and fittings such as lifts or air-conditioning are often an integral part of a building and is generally included in the fair value of the investment property, rather than recognised separately as PP&E.
- Additional assets may be necessary in order the property can be used for its specific purposes. So, if an office is leased on a furnished basis, the fair value of the office generally includes the fair value of the furniture, because the rental income relates to the furnished office. When furniture is included in the fair value of investment property, an entity does not recognise that furniture as a separate asset.
- When an entity separately recognises prepaid or accrued operating lease income and lease incentives in the statement of financial position, the investment property valuation may also include such items. If so, an adjustment is required to avoid double-counting the asset or liability (see 3.3.6 below).
- The fair value of investment property held by a lessee as a right-of-use asset reflects expected cash flows, including variable lease payments that are expected to become payable. If a property valuation of investment property held by a lessee as a right-of-use asset is obtained net of the valuer's estimate of the present value of the future lease obligations, (which is usually the case), an amount must be added back by adjusting for the lease liability recognised in the statement of financial position, to arrive at the carrying amount of the investment property, because the lease liability is already recognised in the statement of financial position (see 3.3.7 below).

How we see it

An entity must take care, when determining the carrying amount of investment property under the fair value model, not to double count assets or liabilities that are recognised separately. An entity would need to consider the specific inputs included in the investment property valuation to assess whether it includes assets and liabilities which are also recognised separately on the statement of financial position. If so, in our view, an adjustment will always be required to avoid double-counting assets or liabilities.

Conversely, an entity may have other assets that have not been included within the valuation, in which case these will be recognised separately and accounted for in accordance with relevant sections of FRS 102, e.g., Section 17 for PP&E.

3.3.3 Inability to determine fair value of investment property

As discussed in 3.3.2.A above, in determining the fair value of an investment property, an entity must use valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value, prioritising observable inputs over unobservable inputs. However, valuation techniques, or the use of multiple techniques, can often produce a range of reasonable valuations. Therefore, selection of the most appropriate fair value within the range requires judgement, considering qualitative and quantitative factors specific to the measurement. *[FRS 102.2A.20]*.

When an entity estimates the fair value of an investment property using appropriate valuation techniques, there could be an indication that its fair value will not be reliably measurable. For example, there might be clear evidence that the variability in the range of reasonable fair value measurements will be so great, and the probabilities of the various outcomes so difficult to assess, that the usefulness of a single measure of fair value will be negated. In this case, Section 2A precludes the entity from measuring the asset at fair value. *[FRS 102.2A.22]*.

Following the guidance on determining fair value in the Section 2A, if a reliable measure of fair value is no longer available for an investment property measured at fair value, its carrying amount at the last date the investment property was reliably measurable becomes its new 'cost'. The entity must measure the investment property at this 'cost' amount less impairment (if any), until a reliable measure of fair value becomes available (see Chapter 10 at 4.11.5). *[FRS 102.2A.23, FRS 102.BC.B16.4]*.

Note that while such property is held at cost less impairment, an investment property whose fair value can no longer be measured reliably must still be classified as investment property, instead of transferring and accounting for it as PP&E or if applicable, as a right-of-use asset (see 3.4 below).

The FRC particularly noted that in the UK, entities should generally be able to obtain a fair value for an investment property, which would provide useful, decision-relevant information to users of the financial statements. *[FRS 102.BC.B16.1]*. Further, the FRC noted that prior to the introduction of FRS 102, investment properties were required to be measured at open market value. *[FRS 102.BC.B16.4]*. Therefore, it appears reasonable to expect that in practice, the inability to determine fair value of investment property would occur only in exceptional cases.

The accounting consequences when the fair value cannot be measured reliably for investment property under construction and mixed use property are discussed at 3.3.4 below and 3.1.7 above, respectively. See Chapter 10 at 4.11.5 for further discussion on determining a reliable measure of fair value.

3.3.4 The fair value of investment property under construction

In practice, many entities engage professionally qualified and experienced independent valuers in estimating the fair value of investment property under construction.

How we see it

Determining the fair value of investment property under construction will often be more judgemental than for completed property because:

- There are generally few or limited observable transactions for investment property under construction. Where such assets are transacted, this is typically when they are in the very early stages of development or when they are nearly complete and substantially let.
- Additional assumptions must be made about the risks and costs of any incomplete construction.

It is worth noting that, in light of the requirements of Section 2A, an entity will have to determine whether fair value can be reliably measured or not under the requirements in Section 2A. This is discussed in Chapter 10 at 2.4 and Chapter 10 at 4.11.5.

As discussed in 3.1.1 above, the reference to Section 17 when determining the cost of a self-completed property implies that the FRC believes that an investment property under construction is normally recognised and measured initially at cost under Section 17 on the grounds that the fair value cannot be reliably measurable until completion. However, as also discussed in 3.1.1 above, if the fair value can be reliably measured during construction, then FRS 102 would require that investment property under construction is held at fair value. *[FRS 102.16.7]*.

Therefore, where an entity determines that the fair value of an investment property under construction is not reliably measurable but it expects the fair value to be reliably measurable when construction is complete, it is reasonable to expect that such investment property under construction is measured at cost until such time as the fair value becomes reliably measurable or construction is completed (whichever comes earlier). In any event, some entities do consider that not all of their investment property under construction can be reliably measured and have developed criteria to make that assessment.

Once construction of such property is complete, it can be presumed that fair value can be measured reliably. If this is not the case, and this will be only in exceptional situations, then the guidance discussed in 3.3.3 above must be followed.

3.3.5 Transaction costs incurred by the purchaser of an investment property

An issue that arises in practice is whether transaction costs that have been incurred by the reporting entity on purchase of an investment property must be taken into account in determining the subsequent fair value of the property when applying the fair value model. This is shown in the following Illustration:

Illustration 3-4: The fair value model and transaction costs incurred at acquisition

On 1 January 20X6 Entity A acquired an investment property for a purchase price of £10,000. In addition, Entity A incurred legal costs of £200 in connection with the purchase and paid property transfer tax of £400. Accordingly, the investment property was initially recorded at £10,600. Entity A applies the fair value model for subsequent measurement of investment property:

	Development of prices in property market	Appraised market value of property	Cost of property initially recognised	Difference
		£	£	£
Scenario 1	Unchanged	10,000	10,600	(600)
Scenario 2	Slightly increased	10,250	10,600	(350)
Scenario 3	Significantly increased	11,000	10,600	400
Scenario 4	Decreased	9,500	10,600	(1,100)

The issue that arises in practice is whether or not the acquisition-related transaction costs that were incurred by Entity A on 1 January 20X6 can be considered in determining the fair value of the investment property at the next reporting date.

The acquisition-related transaction costs incurred by Entity A would not be considered separately in determining the fair value of an investment property in accordance with Section 2A. In the example above, on the next reporting date the carrying amount to be recorded in the statement of financial position is its fair value, measured in accordance with Section 2A. Changes from the initial carrying amount to the appraised market value at the subsequent reporting date (reflected in the 'Difference' column in the table) are recognised in profit or loss. [FRS 102.16.7].

Although Section 16 states that transaction costs incurred by a purchaser on the acquisition of an investment property are included in the cost of the investment property at initial recognition, [FRS 102.16.5], if an entity applies the fair value model, the same investment property that was recorded at cost on initial recognition is subsequently measured at fair value in accordance with Section 2A. The fact that the cost of the investment property recorded on initial recognition included legal and other transaction costs is irrelevant to the subsequent fair value measurement of the asset.

Section 2A clarifies that "the price in the market shall not be adjusted for transaction costs because they are not a characteristic of an asset or a liability; they are specific to a transaction". [FRS 102.2A.8].

Likewise, when measuring the fair value of an investment property, it is not appropriate to add the acquisition-related transaction costs incurred by the purchaser to fair value, as these have no relevance to the fair value of the property. Therefore, some or all of the transaction costs incurred when acquiring the investment property that were capitalised in accordance with Section 16 will effectively be expensed as part of the subsequent fair value gain or loss.

See Chapter 10 at 4.7.1 for further discussion.

3.3.6 Prepaid and accrued operating lease income

3.3.6.A Accrued rental income and lease incentives

The discussion in 3.3.2.B above about avoiding double-counting assets or liabilities recognised separately is most commonly encountered when the carrying amount of an investment property is reduced below its fair value to the extent that a separate asset arises under Section 20. For example, when an entity offers an initial rent-free period to a lessee, it will accrue an asset during the rent-free period and then amortise it over the remaining lease term, thereby spreading the reduction in rental income over the term of the lease. If such asset is separately recognised from the investment property, the amount of that separate asset is excluded from the fair value of the investment property in order to arrive at the carrying amount of the investment property for the purposes of the financial statements, and thus, avoid double counting (see 3.2.9.A above).

3.3.6.B Prepaid rental income

The same principles as discussed in 3.2.9.A and 3.3.6.A above are applied when rental income arising from an operating lease is received in advance i.e., as a policy choice, the resulting liability could be recognised either separately from, or included in, the carrying amount of the investment property. The former treatment is demonstrated in the Illustration below:

Illustration 3-5: Investment property and rent received in advance

A company owns land with an estimated value of £10 million as at 1 January 20X5 that is accounted for as investment property. The company applies the fair value model in Section 16 and has a reporting period ending on 31 December each year.

The land was not let until, on 30 December 20X5, a lease of 50 years was granted for consideration of £9.5 million received in advance. The lease is considered to be an operating lease. No rental income was recognised in 20X5 as it was considered immaterial. An external valuer estimated that, after the grant of the 50-year lease, the fair value of the company's interest in the land as at 31 December 20X5 was £1 million. As at 31 December 20X6 the external valuer estimated the fair value of the interest in the property was £1.2 million.

The resultant accounting entries are summarised below.

Extracts from the ledgers for the year ended 31 December 20X5

(All figures in £ millions)

	As at 1 January 20X5	Journal (1)	Journal (2)	Journal (3)	As at 31 December 20X5
Investment property	10.0	-	(9.0)	9.5	10.5
Cash	-	9.5	-	-	9.5
Deferred income	-	(9.5)	-	-	(9.5)

Journals:

- (1) Amortise rent (one year of the £9.5 million received for 50 years).
- (2) Write down investment property to £1.2 million external valuation.
- (3) Write up the book value of property by the amount of unamortised deferred revenue in the statement of financial position (£9.31 million).

3.3.7 Valuation adjustment to the fair value of properties held under a lease

As discussed in 3.3.2 and 3.3.2.B above, the fair value of investment property held by a lessee as a right-of-use asset will reflect expected cash flows, including variable lease payments that are expected to become payable. Accordingly, if a valuation obtained for a property is net of all payments expected to be made, it will be necessary to add back any recognised lease liability, to arrive at the carrying amount of the investment property using the fair value model.

Therefore, if the entity obtains a property valuation net of the valuer's estimate of the present value of future lease obligations (which is usual practice), to the extent that the lease obligations have already been accounted for in the statement of financial position as a lease obligation, an amount is to be added back to arrive at the carrying amount of the investment property for the purposes of the financial statements.

The valuation adjustment referred to above is achieved by adjusting for the lease liability recognised in the financial statements.

This is shown using the information in the following Illustration:

Illustration 3-6: Valuation of a property held under a lease

Entity A pays £991,000 for a 50-year leasehold interest in a property which is classified as an investment property using the fair value model. In addition, a ground rent of £10,000 is payable annually during the lease term, the present value of which is calculated at £99,000 using a discount rate of 10% which reflects the rate implicit in the lease at that time. The company has initially recognised the investment property at the following amount:

	£'000
Amount paid	991
Present value of the ground rent obligation on acquisition	<u>99</u>
Cost recorded for financial reporting purposes	1,090

Assume at the next reporting date the leasehold interest in the property has a fair value of £1,006,000 measured (based on market participant assumptions) as follows:

	£'000
Present value of estimated future lease income	1,089
Less: Present value of the ground rent obligation at the reporting date *	<u>(83)</u>
Fair value	1,006

* The market required yield has changed to 12%. Therefore, the present value of the ground rent obligations of £10,000 per annum for the remaining 49 years is now £83,000.

At the same time the ground rent lease liability has reduced to £98,000 as payments are made.

This would give the following results:

	£'000
Fair value	1,006
Add recognised lease liability	98
Carrying amount for financial reporting purposes	1,104

The statement of financial position of Entity A would therefore contain the following items:

	Investment property	Lease liability
	£'000	£'000
On acquisition	1,090	99
End of year 1	1,104	98

3.3.8 Future capital expenditure and development value ('highest and best use')

It is common for the value of land to reflect its potential future use and the value of land may increase in the event that the owner obtains any required permissions for a change in the use of that land.

It may be, for example, that a permission to change from an industrial to residential use will increase the value of the property as a whole, notwithstanding that the existing industrial buildings are still in place. This increase in value is typically attributable to the land, rather than the buildings.

It is therefore important to note that Section 2A requires consideration of all relevant factors in determining whether the highest and best use of a property can be something other than its current use at the measurement date. Section 2A presumes that an entity's current use of an asset is generally its highest and best use unless market or other factors suggest that a different use of that asset by market participants would maximise its value. [FRS 102.2A.11].

Section 2A states: [FRS 102.2A.9, FRS 102.2A.10]

Extract from Section 2A

- 2A.9** A fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use.
- 2A.10** The highest and best use takes into account the use of the asset that is physically possible, legally permissible and financially feasible.

Whilst Section 2A does not have further guidance, IFRS 13 further explains that a use that is physically possible takes into account the physical characteristics of the asset (e.g., the location or size of a property) that market participants would take into account when pricing the asset. A use that is legally permissible takes into account any legal restrictions on the use of the asset (e.g., the zoning regulations applicable to a property) that market participants would take into account when pricing the asset. A use that is financially feasible takes into account whether a use of the asset that is physically possible and legally permissible generates adequate income or cash flows (taking into account the costs of converting the asset to that use) to produce an investment return that market participants would require from an investment in that asset put to that use. [IFRS 13.28]

How we see it

Considerable judgement may have to be applied in determining when an anticipated change is legally permissible. For example, if approval is required for rezoning land or for an alternative use of existing property interests, it may be necessary to assess whether such approval is a substantive legal requirement or not. See Chapter 10 at 4.8.1 for further discussion on determining highest and best use.

If management determines that the highest and best use of an asset differs from its current use, certain valuation matters must be considered. Appraisals that reflect the effect of a reasonably anticipated change in what is legally permissible must be carefully evaluated. If the appraised value assumes that a change in use can be obtained, the valuation must also reflect the cost associated with obtaining approval for the change in use and transforming the asset, as well as capture the risk that the approval might not be granted (that is, uncertainty regarding the probability and timing of the approval).

Expectations about future improvements or modifications to be made to the property to reflect its highest and best use may be considered in the appraisal, such as the renovation of the property or the conversion of an office into condominiums, but only if and when other market participants would also consider making these investments and reflect only the cash flows that market participants would take into account when assessing fair value.

See Chapter 10 at 4.8 for further discussion on application of Section 2A requirements to non-financial assets which includes determining highest and best use.

3.3.9 Negative present value

In some cases, an entity expects that the present value of its payments relating to an investment property (other than payments relating to recognised liabilities) will exceed the present value of the related cash receipts. An entity applies Section 21 *Provisions and Contingencies* to determine whether to recognise a liability and, if so, how to measure that liability.

3.4 Transfers of assets to or from investment property

The instances where Section 16 explicitly requires transfers of investment property to PP&E or to right-of-use assets are the following:

- When an entity chooses to account for investment property (or part of such property) that is rented to another group entity by transferring its owned property to PP&E and applying the cost model in accordance with Section 17, or if the property is held by the entity as the lessee, to right-of-use assets and applying the cost model in accordance with Section 20 (see 3.1.2 above).
And
- When the entire mixed use property is accounted for as PP&E in accordance with Section 17 in the case of property held by the owner or, as a right-of-use asset in accordance with Section 20 in the case of property held by the entity as the lessee, because the fair value of the investment property component cannot be measured reliably (see 3.1.7 above).

Section 16 also establishes a guiding principle regarding transfers to, or from, investment property as follows: [FRS 102.16.9]

Extract from Section 16

16.9 Unless otherwise required by this FRS, an entity shall transfer a property to, or from, investment property only when the property meets, or ceases to meet, the definition of investment property and there is evidence of that change.

It reflects the principle that a transfer of a property to, or from, investment property is required only when there is a change in use which would involve:

- (a) An assessment of whether a property meets, or has ceased to meet, the definition of investment property.
And
- (b) Supporting evidence that a change in use has occurred.

This means that, unless specifically required by FRS 102 (such as items described above), there must be evidence that a change in use has occurred to support a transfer of property. Accordingly, a change in management's intentions, in isolation, would not be enough to support a transfer of property. This is because management's intentions, alone, do not provide evidence of a change in use. Observable actions toward effecting a change in use must have been taken by the entity during the reporting period to provide evidence that such a change has occurred.

The assessment of whether a change in use has occurred is based on an assessment of all the facts and circumstances and judgement is needed to determine whether a property qualifies as investment property. If significant, disclosure of this judgement would be required by Section 8. [FRS 102.8.6].

If it is determined that a change in use has occurred, Section 16 requires an entity to transfer the property to, or from, investment property.

We illustrate the application of this principle with an example below:

Illustration 3-7: Transfers from inventory

In 20X5, an entity purchased land with the intention of constructing an apartment building on the land and selling the apartments to private customers. Accordingly, the land was classified as inventory. During 20X5, the prices for residential properties decreased and the entity decided to change its original business plans at the beginning of 20X6. Instead of constructing an apartment building and selling the apartments, the entity decided to construct an office building that it would lease out to tenants. The entity holds and manages other investment property as well.

During the first half of 20X6, the entity obtained permission from the relevant authorities to commence the construction and hired an architect to design the office building. The physical construction of the office building began in August 20X6. No operating leases had been agreed with other parties for the lease of office space. However, negotiations had been held with potential tenants.

The inception of an operating lease is generally evidence of a change in use for a transfer from inventories to investment property. However, even in the absence of the inception of an operating lease, there may be other circumstances that provide evidence of a change in use. In determining whether there is sufficient evidence for a change in use from inventory to investment property, all of the following criteria must be considered:

- The entity has prepared a business plan that reflects the future rental income generated by the property and this is supported with evidence that there is demand for rental space.
- The entity can demonstrate that it has the resources, including the necessary financing or capital, to hold and manage an investment property (which requires different skills than developing a property). If the entity also owns other investment property, this could be more easily demonstrated. However, if this property would be the entity's only investment property, it may be harder to demonstrate this.
- The change in use is legally permissible. That is, the entity has obtained permission from relevant authorities for the change in use. In cases where the approval of the change in use is merely a routine or a non-substantive legal requirement (i.e., not at the discretion of the authorities), the entity's request for permission may be sufficient evidence.

And

- If the property must be further developed for the change in use, development has commenced.

How we see it

Judgement is required when the change in use is evidenced by circumstances other than the inception of an operating lease. We would generally conclude that there is sufficient evidence for a change in use from inventory to investment property if all of the criteria referred to above are met.

For the scenario described in the fact pattern above, the entity met the above criteria at the point in time when it obtained permission from the relevant authorities to change the use of the property and commenced development of the property by hiring an architect. At that time, the land would be transferred from inventory to investment property as it is now held to earn rentals rather than sale proceeds.

3.4.1 Transfers from investment property to inventory

Transfers to inventory are more difficult to deal with by way of the application of a general principle since it is a common practice in the real estate industry to hold investment properties as assets 'available' for sale. This is especially the case when an entity believes it is economical to sell the assets before they reach their peak of capital growth, or when recycling of equity (selling owned property to buy new property) presents more opportunities for capital appreciation, or in situations where an entity urgently needing cash for operations wants to release money tied up in real estate properties. FRS 102 does not provide further guidance on this therefore, it would be reasonable to consider the related guidance in adopted IFRS.

Under IAS 40, unless there is development with a view to sale, it will not be possible to reclassify investment property as inventory even if the entity holding that property changes its intentions and is no longer holding that property for rental or capital appreciation. [IAS 40.57(b)]. Accordingly, when an entity decides to dispose of an investment property without development, it continues to classify the property as an investment property until it is derecognised (see 3.5 below) and does not reclassify it as inventory. Similarly, if an entity begins to redevelop an existing investment property for continued future use as investment property, the property remains an investment property and is not reclassified as owner-occupied property during the redevelopment. [IAS 40.58].

3.4.2 Accounting treatment of transfers

When an entity completes the construction or development of a self-constructed investment property that will be carried at fair value (i.e., no actual reclassification to investment property), any difference between the fair value of the property at that date and its previous carrying amount must be recognised in profit or loss. [FRS 102.16.7].

When an entity uses the cost model in Section 17 or Section 20 for certain investment property (see 3.1.2, 3.1.7 above) or the entity measures the investment property at cost amount less impairment (see 3.3.3 above), then transfers between such investment property, owner-occupied property and inventories do not change the carrying amount of the property transferred and they do not change the cost of that property for measurement or disclosure purposes.

Section 16 provides guidance in accounting for transfers to, or from, investment property under the fair value model. These are discussed below.

3.4.2.A Transfer from investment property to owner-occupied property

When a property ceases to meet the definition of an investment property, for example it becomes owner-occupied or the commencement of development with a view to owner-occupation, the deemed cost for subsequent accounting as PP&E (in accordance with Section 17 - see Chapter 20) or as a right-of-use asset (in accordance with Section 20 - see Chapter 23) must be its fair value at the date of change in use.

[FRS 102.16.9A].

The carrying amount of the investment property at the date of transfer becomes its 'cost'. There is no ability to restate the asset back to cost less depreciation and impairment, and reverse out previous fair value gains.

Where the 'cost' of such property described above is not the historical cost amount, under UK law the property is being carried at a revalued amount under the alternative accounting rules. Consequently, any upwards revaluation compared to the historical cost amounts must be transferred to the statutory revaluation reserve (as a reserves transfer) and the statutory disclosures for revalued assets would apply. [1 Sch 34, 1 Sch 35]. Company law and Section 17 disclosure requirements for revalued properties will apply to the property on an ongoing basis even if the entity applies the cost model going forward, including the need to disclose comparable amounts determined according to the historical cost accounting rules (see Chapter 20 at 3.10.1). [FRS 102.17.32A].

Subsequently, there may be transfers of reserves to the extent the entity is realising the revaluation reserve. The alternative accounting rules allow that an amount may be transferred from the revaluation reserve to the profit and loss account, if the amount was previously charged to the profit and loss account or represents a realised profit. [1 Sch 35(3)]. Therefore, where depreciation or an impairment has been charged based on the deemed cost which exceeds the historical cost, the excess depreciation or impairment (over that which would have been charged based on historical cost) may be transferred from the revaluation reserve to retained earnings (as a reserves transfer). Similarly, on sale of the asset, the amount in the revaluation reserve, where realised on sale, could be transferred to retained earnings (as a reserves transfer in equity). See also relevant discussions in Chapter 20 at 3.7.3.A.

Investment property transferred to PP&E where the fair value of that property can still be measured reliably, for example a transfer to PP&E because the property is no longer held to earn rentals and/or capital appreciation, can be measured subsequently under either the cost or revaluation models of Section 17 (provided that where the revaluation model is selected, this must be applied to all items of PP&E in the same class) - see Chapter 20 at 3.7. [FRS 102.17.15]. Similarly, if the fair value of an investment property can still be measured reliably but the property is transferred to right-of-use asset because of a change in use, the property can be measured subsequently under either the cost model of Section 20 or the revaluation model of Section 17 (provided that where the revaluation model is selected, this must be applied to all items of right-of-use assets that relate to the same class of property) - see Chapter 23 at 6.3.1.B. [FRS 102.20.55, FRS 102.20.61].

3.4.2.B Transfer from investment property to inventories

When a property ceases to meet the definition of an investment property and it becomes inventory (e.g., commencement of development with a view to sale - 3.4.1 above), the deemed cost for subsequent accounting as an inventory (in accordance with Section 13 - see Chapter 16) must be its fair value at the date of change in use. [FRS 102.16.9A].

The carrying amount of the investment property at the date of transfer becomes its 'cost'. There is no ability to restate the asset back to cost less depreciation and impairment, and reverse out previous fair value gains. However, using such cost as 'deemed cost' of any investment property transferred to inventory - which is usually then carried using the cost model at the lower of cost and net realisable value - may represent a departure from Company Law where this 'cost' is not the same as the historical cost amount. Inventories are no longer permitted to be stated at their current cost under the alternative accounting rules nor does this 'deemed cost' apply the fair value accounting rules. Therefore, in some situations, use of 'deemed cost' would require necessary disclosures relating to the true and fair override of Company Law.

[1 Sch 10(2)].

Please also see other practical considerations discussed at 3.1.9 and 3.4.1 above.

3.4.2.C Transfer from owner-occupied property to investment property

If an owner-occupied property becomes an investment property, an entity must apply Section 17 (for owned property) or Section 20 (for property held by a lessee as a right-of-use asset) up to the date of change in use. The entity must treat any difference at that date between the carrying amount of the property in accordance with Section 17 or Section 20 (as applicable) and its fair value in the same way as a revaluation in accordance with Section 17 or Section 20 (as applicable). [FRS 102.16.9B]. The treatment depends on whether it is a decrease or increase in value and whether the asset had previously been revalued or impaired in value (see Chapter 20 at 3.7.4 and 3.7.5).

Accordingly, up to the date when an owner-occupied property becomes an investment property carried at fair value, an entity depreciates the property (or the right-of-use asset) and recognises any impairment losses that have occurred. At that date, any difference between the carrying amount of the property in accordance with Section 17 or Section 20 (as applicable) and its fair value is treated in the same way as a revaluation in accordance with Section 17 or Section 20 (as applicable). In other words:

- (a) Any resulting decrease in the carrying amount of the property is recognised in profit or loss. However, to the extent that an amount is included in revaluation surplus for that property, the decrease is recognised in other comprehensive income and reduces the revaluation surplus within equity.
- (b) Any resulting increase in the carrying amount is treated as follows:
 - (i) To the extent that the increase reverses a previous impairment loss for that property, the increase is recognised in profit or loss. The amount recognised in profit or loss does not exceed the amount needed to restore the carrying amount to the carrying amount that would have been determined (net of depreciation) had no impairment loss been recognised.
 - (ii) Any remaining part of the increase is recognised in other comprehensive income and increases the revaluation surplus within equity.

If the owner-occupied property had not previously been revalued, the transfer to investment property does not imply that the entity has now chosen a policy of revaluation for other property accounted for under Section 17 or Section 20 (as applicable) in the same class.

How we see it

While not explicitly addressed in Section 16, or Section 17 or Section 20, if an owner-occupied property had not previously been revalued, the revaluation arising on transfer to investment property that is recognised in other comprehensive income may, but is not required to, be accumulated in retained earnings because the asset is measured under fair value accounting rules going forward.

When an owner-occupied property that has previously been revalued (e.g., a revaluation reserve was created or retained on measuring the property at deemed cost on transition to FRS 102) or that had been previously measured under the revaluation model in Section 17 is transferred to investment property, in our view, any amounts in the revaluation reserve may likewise, but are not required to, be transferred to retained earnings via the statement of changes in equity (as this is no longer a revaluation under the alternative accounting rules).

However, as discussed at 3.3 above, an entity is not precluded from transferring the revaluation reserve to a separate non-distributable reserve, instead of to retained earnings, because this may assist with the identification of distributable profits. [FRS 102.A3.28]. Any such transfer from retained earnings to a non-distributable reserve is a reserves transfer that is shown in the statement of changes in equity.

Subsequently, when the property is derecognised (see 3.5 below), any amount accumulated in the revaluation reserve (or in a separate non-distributable reserve) relating to that item, where realised on derecognition, could be transferred to retained earnings. Again, any transfer is made directly from such reserves to retained earnings, and not through profit or loss. [1 Sch 35(3)].

3.4.2.D Transfer from inventories to investment property

As described in Illustration 3-7 above, the inception of an operating lease to another party is generally evidence of a change in use for a transfer from inventories to investment property (see also other considerations discussed in 3.1.8 above).

For a transfer from inventories to investment property that will be carried at fair value, any difference between the fair value of the property at that date and its previous carrying amount must be recognised in profit or loss. [FRS 102.16.9C].

How we see it

The above treatment is consistent with the treatment of sales of inventories. However, this does not mean that revenue is recognised upon transfer of a property from inventory to investment property because control of the property is not transferred to a customer (i.e., the same property remains with the entity) and it is not a transaction that has commercial substance.

3.5 Derecognition

Accounting for disposals of investment property is not addressed specifically within Section 16. However, Section 17 has requirements and guidance in respect of derecognition of PP&E, including replacement of parts, which can be applied to investment properties. See Chapter 20 at 3.8 for further guidance.

Accordingly, an investment property must be derecognised (eliminated from the statement of financial position) on disposal or when the investment property is permanently withdrawn from use (i.e., retirement) and no future economic benefits are expected from its disposal. [FRS 102.17.27].

A disposal of an investment property may be achieved by: [FRS 102.17.28].

- Its sale
 - When it becomes the subject of a finance lease (the owner becoming the lessor)
- Or
- When it becomes the subject of a sale and leaseback deal (the original owner becoming the lessee)

These derecognition rules also apply to a part of the investment property that has been replaced (see 3.5.3 below).

Section 20 applies if a property is disposed of by the owner becoming a lessor in a finance lease (see Chapter 23 at 7.3), or if a property is the subject of a sale and leaseback transaction (see Chapter 23 at 9).

Consistent with Section 17, if disposal of investment property is achieved by sale, the determination of the timing of recognition of any gain or loss must be in accordance with Section 23 *Revenue from Contracts with Customers*. Consequently, the date of disposal for investment property that is sold is the date the recipient obtains control of the investment property in accordance with the requirements for determining when a performance obligation is satisfied at a point in time in Section 23 (see Chapter 25 at 8.2).

[FRS 102.17.29]. In many cases, control will transfer when the buyer obtains legal title and physical possession of the asset. However, this may occur prior to legal settlement if it can be demonstrated that control has passed to the buyer before that date.

For the detailed discussion and requirements of Section 23 on satisfaction of performance obligations, see Chapter 25 at 8.

Under UK company law, any profit treated as unrealised, becomes realised as the related asset is sold for qualifying consideration. Therefore, when the property is derecognised, any amount accumulated in the revaluation reserve (or in a separate non-distributable reserve) relating to that item, where realised on derecognition, could be transferred to retained earnings. Any transfer is made directly from such reserves to retained earnings, and not through profit or loss. [1 Sch 35(3)].

3.5.1 Calculation of gain or loss on disposal

Following guidance in Section 17, gains and losses on retirement or disposal of investment property are calculated based on the difference between the net disposal proceeds (after deducting direct costs of disposal) and the carrying amount of the asset. [FRS 102.17.30]. Section 17 does not give guidance on how to determine the carrying amount of the asset (nor IAS 40). Possible alternatives would include the use of (i) the carrying amount in the financial statements of the last full period of account, or (ii) the carrying amount in the latest interim financial statements, or (iii) the updated carrying amount at the date of disposal.

How we see it

In our view, determining the carrying amount of the asset using any of the possible alternatives described above is a policy choice for an entity to make and is primarily a matter of income statement presentation to the extent that an entity presents gains and losses on disposal separately from gains and losses on revaluation.

Gains and losses on retirement or disposal of investment property are recognised in profit or loss, unless it is a sale and leaseback and Section 20 requires a different treatment, in the period of retirement or disposal. The entity must not classify such gains as revenue. [FRS 102.17.28]. See Chapter 23 at 9 for a discussion of sale and leaseback under Section 20.

Neither Section 16 nor Section 17 specifies how the disposal proceeds is determined. However, Section 23 provides guidance on determination of transaction price. Under Section 23, an entity is required to consider the terms of the contract and its customary business practices in determining the transaction price. Transaction price would be the amount of consideration to which an entity expects to be entitled in exchange for transferring the property to a buyer, excluding amounts collected on behalf of third parties (e.g., sales taxes). The consideration in a contract may include fixed amounts, variable amounts, or both.

In many cases, the transaction price may be readily determined if the entity receives payment when it transfers the property and the price is fixed. In other situations, it could be more challenging as it may be affected by the nature, timing and amounts of consideration.

Determining the transaction price is discussed in detail in Chapter 25 at 6.

Subsequent changes to the estimated amount of the consideration included in the gain or loss could be accounted for in accordance with the requirements for changes in the transaction price in Section 23. This is further discussed in Chapter 25 at 7.5.

If an entity retains any liabilities after disposing of an investment property these are measured and accounted for in accordance with Section 21 or other relevant sections of FRS 102, as appropriate. Accounting for such liabilities depends on specific facts and circumstances as such a liability may represent a provision (e.g., assurance-type warranty provisions) or a contingent liability under Section 21, or a financial liability under Section 11 or Section 12, or a separate performance obligation (e.g., service-type warranties) or variable consideration (e.g., fines and penalties) under Section 23. See also related discussions in Question 6-4 in Chapter 25 at 6.2.1.

3.5.2 Sale prior to completion of construction

A property that is subject to sale prior to completion of construction, if not previously classified as investment property, is likely to be property intended for sale in the ordinary course of business (see 3.1.9 above) and is therefore not likely to be investment property. Accordingly, the requirements in Section 23 must be followed.

If, however, the property subject to sale prior to completion of construction is previously classified as investment property, guidance discussed in 3.2 and 3.5.1 above would be followed. Any consequent construction services to be provided by the seller would likely be subjected to the requirements of Section 23.

For further discussion of Section 23, see Chapter 25.

3.5.3 Replacement of parts of investment property

For certain investment property that is carried under the cost model in Section 17 or Section 20 (see 3.1.2 and 3.1.7 above), an entity applies the guidance relevant to replacement of parts of PP&E in Section 20 (see Chapter 20 at 3.8). That is, the entity derecognises the carrying amount of the original part. A replaced part might not be a part that was depreciated separately, in which case, if it is not practicable to determine the carrying amount of the replaced part, it may be acceptable for the entity to use the cost of the replacement as an indication of an appropriate carrying amount (see Chapter 20 at 3.3.3). This does not mean that the entity has to apply depreciated replacement cost, rather that it can use the cost of the replacement as an indication of the original cost of the replaced part in order to reconstruct a suitable carrying amount for the replaced part.

Section 16 does not address replacement of parts of investment property using fair value model (nor replacement of parts of investment property measured at cost amount less impairment - see 3.3.3 above). Therefore, it is reasonable to consider the guidance in Section 17 as described above.

When an entity that applies the fair value model wishes to capitalise a replacement part (provided it meets the recognition criteria in 3.1 above), the question arises of how to deal with the cost of the new part and the carrying amount of the original. The basic principle is that the entity derecognises the carrying amount of the replaced part - as discussed above. However, the problem frequently encountered is that even if the cost of the old part is known, its carrying amount - at fair value - is usually by no means clear. It is possible also that the fair value may already reflect the loss in value of the part to be replaced, because the valuation reflected the fact that an acquirer would reduce the price accordingly.

As all fair value changes are taken to profit or loss, it is reasonable to conclude that it is not necessary to identify separately the elements that relate to replacements from other fair value movements. Therefore, if it is not practical to identify the amount by which fair value must be reduced for the part replaced, the cost of the replacement is added to the carrying amount of the asset and the fair value of the investment property as a whole is reassessed. Also, it can be noted that this is the treatment that would be applied to additions that did not involve replacing any existing part of the property.

3.5.4 Compensation from third parties

For certain investment property that is carried under the cost model in Section 17 or Section 20 (see 3.1.2 and 3.1.7 above), an entity applies the guidance in Section 17 to the treatment of compensation from third parties if property has been impaired, lost or given up (see Chapter 20 at 3.6.6.A). It stresses that impairments or losses of investment property, related claims for or payments of compensation from third parties and any subsequent purchase or construction of replacement assets are separate economic events that have to be accounted for separately. However, Section 16 does not address these for investment property using fair value model. Therefore, it is reasonable to consider the guidance in Section 17 as described above.

Accordingly, impairment of investment property will be recorded automatically if the fair value model is used; but if the property is accounted for using the cost model in Section 17 or Section 20, it is to be calculated in accordance with Section 27 (see Chapter 29). If the entity no longer owns the asset, for example, because it has been destroyed or subject to a compulsory purchase order, it will be derecognised (see 3.5 above). Compensation from third parties (for example, from an insurance company) for property that was impaired, lost or given up is recognised in profit or loss when the compensation is virtually certain. [FRS 102.17.25]. The cost of assets restored, purchased or constructed as replacements is accounted for wholly on its own merits according to the recognition and measurement rules covered in sections 3.2 and 3.3 above.

4 Presentation and disclosures

The key presentation requirements are set out in 4.1 and 4.2 below. However, refer to Chapter 6 for the detailed discussion of the requirements for financial statement presentation relevant to investment property.

The main disclosure requirements of Section 16 and other sections of FRS 102 relating to investment property are set out at 4.3 and 4.4 below, respectively. Other disclosures required by the Companies Act in respect of investment property are set out at 4.5 below.

4.1 Presentation in the statement of financial position

Section 4 *Statement of Financial Position* provides presentation guidance for the statement of financial position (see Chapter 6).

When using the 'statutory formats' (see Chapter 6 at 4.2 and 5.3.3.A), investment property would be included within tangible fixed assets. While it is not required to present investment property on the face of the balance sheet, The Regulations permit items to be shown in greater detail. Further, FRS 102 requires additional line items, headings and subtotals when relevant to an understanding of the entity's financial position. [FRS 102.4.3]. Therefore, some entities may consider it appropriate to present investment property as a separate line item on the face of the balance sheet.

For an entity using the 'adapted formats' (see Chapter 6 at 4.1 and 4.1.4), and when material, investment property carried at fair value through profit or loss is required to be presented as a separate line item on the statement of financial position as an item within non-current assets. [FRS 102.4.2A]. However, if 'adapted formats' of presentation of the financial statements are used, an entity generally continues to classify an investment property subsequently intended to be disposed of as non-current unless it is expected to be realised within 12 months after the reporting period, in which case it must be classified as current (see discussion in Chapter 6 at 4.1.1.C).

As discussed in 3.3 above, the FRC observed that entities measuring investment properties at fair value may transfer fair value movements to a separate non-distributable reserve, instead of a transfer to retained earnings, but are not required to do so. Presenting fair value movements that are not distributable profits in a separate reserve may assist with the identification of profits available for that purpose. [FRS 102.A3.28]. Any such transfer from retained earnings to a non-distributable reserve is made in the statement of changes in equity.

4.2 Presentation in the income statement

Section 4 *Statement of Comprehensive Income and Income Statement* provides presentation guidance for the income statement (see Chapter 6).

Neither 'statutory formats' nor 'adapted formats' specify how changes in the fair value and gains or losses of investment property must be presented in the income statement. However, both allow an entity to present additional line items, headings and subtotals when it is relevant to an understanding of the entity's financial performance (see Chapter 6 at 5.7.2). [FRS 102.5.5C, FRS 102.5.9]. Further, when material, fair value changes and gains or losses on disposal of investment property may be presented as separate line items on the face of the income statement or in the notes. [FRS 102.5.9A]. However, for disposal of investment property, resulting gains must not be classified as revenue (see 3.5.1 above).

Some companies may elect to disclose the results of operating activities, or a similar line item, even though this term is not defined. In such cases, the entity must ensure that the amount disclosed is representative of activities that would normally be regarded as 'operating'. It would be inappropriate to exclude items clearly related to operations, such as profits or losses on the sale of investment property, because they occur irregularly or infrequently or are unusual in amount (see Chapter 6 at 5.7.3). [FRS 102.5.9B]. The same analysis is applied when presenting changes in the fair value of investment properties in the income statement. An entity that presents a measure of operating profit in its income statement must determine whether changes in the fair value of its investment property form part of operating activities of the entity and therefore, include such changes in fair value in that measure.

In line with this, it is worth noting that one European regulator has concluded that fair value changes arising from investment property must be taken into account when determining operating results. This decision was reported in the European Securities and Markets Authority's ('ESMA') *Report - 11th Extract from the EECS's Database of Enforcement (ESMA/2011/265)*. The regulator's rationale for this decision was that fair value changes in investment property are a normal part of the activities of a real estate company and feature in the description of the business model of that real estate business.¹⁰⁰

4.3 Disclosures required by Section 16

The following disclosures are required by Section 16: *[FRS 102.16.10]*

- The methods and significant assumptions applied in determining the fair value of investment property.
- The extent to which the fair value (as measured or disclosed in the financial statements) is based on a valuation by an independent valuer who holds a recognised and relevant professional qualification and has recent experience in the location and class of the investment property being valued. If there has been no such valuation, that fact must be disclosed (e.g., a statement that the fair value of investment property is based on internal appraisals rather than on a valuation by an independent valuer as described above).
- The existence and amounts of any restrictions on the realisability of investment property or the remittance of income and proceeds of disposal.
- Contractual obligations to purchase, construct or develop investment property or for repairs, maintenance or enhancements.

And

- A reconciliation between the carrying amounts of investment property at the beginning and end of the period; showing separately:
 - Additions, disclosing separately additions resulting from acquisitions through business combinations.
 - Net gains and losses arising from fair value adjustments.
 - Transfers to and from PP&E - see 3.4 above.
 - Transfers to and from inventories - see 3.4 above.

And

- Other changes (e.g., disposals).

The reconciliation need not be presented for prior periods.

Section 16 further states that all relevant disclosures required for leases which a reporting entity has entered into must be disclosed in accordance with Section 20. *[FRS 102.16.11]*. That is, an entity discloses those items in Section 20 which requires the owner of an investment property to provide lessors' disclosures about leases into which it has entered. Section 20 also requires a lessee that holds an investment property as a right-of-use asset to provide lessees' disclosures and lessors' disclosures for any operating leases into which it has entered. Accordingly, see Chapter 23 at 6.8 and 7.8 for the required disclosures of lessees and lessors, respectively.

The above disclosures are required for all investment property (except for those transferred to, and accounted for, as either PP&E or right-of-use assets as required or allowed by Section 16 - see 3.1.2 and 3.1.7 above). This may mean that the above disclosures are also applicable to investment properties whose fair value can no longer be measured reliably. Such properties are still classified as investment property but are measured at cost amount less impairment, if any, until a reliable measure of fair value becomes available (see 3.3.3 above). *[FRS 102.2A.23]*. However, it is reasonable to expect that only those disclosures that are considered relevant to such properties would be provided. For example, the first two bullet points above might not be relevant.

Entities might also need to consider providing further information about such properties whose fair value can no longer be measured reliably and may consider the disclosures required by IAS 40 such as: *[IAS 40.78]*

- The reconciliation described above could disclose the amounts for such investment property held at cost separately from amounts relating to other investment property held at fair value.
- A description of such investment property.
- An explanation of why fair value cannot be measured reliably.

¹⁰⁰ [Report: 11th Extract from the EECS's Database of Enforcement \(ESMA/2011/265\)](#), ESMA, August 2011, paras. 76-81. Available on the ESMA's website.

- If possible, the range of estimates within which fair value is highly likely to lie.
And
- On disposal of investment property not carried at fair value:
 - The fact that the entity has disposed of investment property not carried at fair value.
 - The carrying amount of that investment property at the time of sale.
And
 - The amount of gain or loss recognised.

The reconciliation described above may also need to show impairment losses and reversals of impairment losses, together with corresponding accumulated opening and ending balances.

Section 27 requires disclosure of impairment losses and reversals of impairment losses including the line item(s) in the statement of comprehensive income (or the income statement, if presented) in which those impairment losses are included or reversed. It also requires an entity to disclose a description of the events and circumstances that led to the recognition or reversal of the impairment loss (see Chapter 29 at 7).

The disclosure requirements for investment properties measured using the cost model in Section 17 or Section 20 (e.g., certain investment property rented to another group entity and/or mixed use property but the fair value of the investment property component cannot be measured reliably - see 3.1.2 and 3.1.7 above, respectively) are set out in Section 17 or Section 20, as applicable (see Chapter 20 at 3.10).

[FRS 102.16.4A].

4.3.1 Fair value estimates

For entities that apply the fair value model in Section 16, attention will focus on the judgemental and subjective aspects of property valuations, because they will be reported in profit or loss.

Note that when a valuation obtained for investment property is adjusted significantly for the purpose of the financial statements, for example to avoid double-counting of assets or liabilities that are recognised separately (see 3.3.2.B above), the entity must consider disclosing a reconciliation between the valuation obtained and the adjusted valuation included in the financial statements, showing separately the aggregate amount of any recognised lease liabilities that have been added back, and any other significant adjustments.

4.3.1.A Methods and assumptions

Methods of estimating fair value is discussed in 3.3.2.A above. Section 16 requires disclosure of the methods and significant assumptions applied in determining the fair value of investment property (see 4.1 above). This is also consistent with the requirement in Section 8 to disclose information about the key assumptions concerning the future, and other key sources of estimation uncertainty at the reporting date, that have a significant risk of causing a material adjustment to the carrying amounts of assets and liabilities within the next financial year. [FRS 102.8.7]. However, no further guidance is provided.

Section 16 refers to Section 2A for guidance on fair value determination which, as discussed in 3.3.1 above, is aligned with IFRS 13. Note that IFRS 13 expands the disclosures related to fair value to enable users of financial statements to understand the valuation techniques and inputs used to develop fair value measurements. Accordingly, an entity may consider the disclosure requirements of IFRS 13, as applied by FRS 102 preparers, for example:

- The methodology used in estimating the fair value, i.e., methodology (a), (b) or (c) as described in paragraph 15 of Section 2A (see 3.3.2.A above). [IFRS 13.93(b)].
- Amount of transfers between methodology (a) and (b) as described in paragraph 15 of Section 2A (see 3.3.2.A above), the reasons and related accounting policies. [IFRS 13.93(c)].
- For fair value measurement using methodology (b) and (c) in paragraph 15 of Section 2A (see 3.3.2.A above), the valuation technique and the inputs used, and changes in the valuation technique, if applicable, and the reasons for those changes. [IFRS 13.93(d)].
- If the highest and best use of a non-financial asset differs from its current use, disclose that fact and the reason for it. [IFRS 13.93(i)].

- For fair value measurement using methodology (c) in paragraph 15 of Section 2A (see 3.3.2.A above):
 - Quantitative information regarding the significant unobservable inputs. *[IFRS 13.93(d)].*
 - A reconciliation from the opening balances to the closing balances (including gains and losses, purchases, sales, issues, settlements and where all such amounts are recognised). *[IFRS 13.93(e)].*
 - The total gains or losses included in profit or loss that are attributable to the change in unrealised gains or losses relating to those assets held at the reporting date, and a description of where such amounts are recognised. *[IFRS 13.93(f)].*
 - A description of the valuation process used by the entity. *[IFRS 13.93(g)].*
- And
 - A narrative description of the sensitivity of the fair value measurement to changes in unobservable inputs if a change in those inputs might result in a significantly different amount and, if applicable, a description of interrelationships between those inputs and other unobservable inputs and of how they might magnify or mitigate the effect of changes in the unobservable inputs. *[IFRS 13.93(h)].*

An entity also assesses whether additional information must be disclosed in order to help financial statement users better understand and evaluate the quantitative information provided by the entity. *[IFRS 13.92]*. This assessment requires judgement and will depend on the specific facts and circumstances of the entity and the needs of the users of its financial statements. For example, if climate risk factors have a material impact on the fair value measurements, an entity might disclose whether and how climate-related factors have been incorporated within the methodologies and inputs.

4.3.1.B Level of disaggregation

As discussed in 3.3.1 and 4.3.1.A above, Section 16 refers to Section 2A for guidance on fair value determination which is aligned with IFRS 13. However, Section 2A does not include disclosure requirements nor further guidance as to the level of information to be provided relating to fair value determination for investment property. Accordingly, an entity may consider the applicable guidance in IFRS 13. Under IFRS 13, as applied by FRS 102 preparers, related fair value disclosures are required for each class of assets (and liabilities). These classes are determined based on:

- The nature, characteristics and risks of the asset or liability.
- And
- The methodology used in estimating the fair value, i.e., methodology (a), (b) or (c) as described in paragraph 15 of Section 2A (see 3.3.2.A above). *[IFRS 13.94]*.

The determination of the appropriate class of assets will require significant judgement. At one end of the spectrum, the properties in an operating segment (as defined by IFRS 8 *Operating Segments*) may be a class of assets for the purpose of the disclosures required by IFRS 13. This may be the case if the properties have the same risk profile (for example, the segment comprises residential properties in countries with property markets of similar characteristics) even if there are a large number of properties in the segment.

At the other end of the spectrum, IFRS 13 disclosures may be required for individual properties or small groups of properties if the individual properties or groups of properties have different risk profiles (for example, a real estate entity with two properties - an office building in a developed country and a shopping centre in a developing country).

The number of classes may need to be greater for fair value measurements which follow the methodology '(c)' in 3.3.3.A above because those measurements have a greater degree of uncertainty and subjectivity.

A class of assets and liabilities will often require greater disaggregation than the line items presented in the statement of financial position. However, sufficient information must be provided to permit reconciliation to the line items presented in the statement of financial position.

When determining the appropriate classes, entities must also consider all of the following: *[IFRS 13.92]*

- The level of detail necessary to satisfy the disclosure requirements.
- How much emphasis to place on each of the various requirements.
- How much aggregation or disaggregation to undertake.
- And
- Whether users of financial statements need additional information to evaluate the quantitative information disclosed.

Determining appropriate classes of assets and liabilities for which disclosures about fair value measurements must be provided requires considerable judgement. *[IFRS 13.94]*.

4.4 Disclosures required by other sections of FRS 102 in respect of investment property

In addition to the required disclosures in 4.1 above, other sections of FRS 102 might require disclosures of specific information relating to investment property, for example:

- Section 8 requires disclosure of, if considered material, accounting policy for investment property and the significant judgements made in the process of applying such accounting policy. [FRS 102.8.5, FRS 102.8.6].
- If, at the reporting date, an entity has a binding sale agreement for a major disposal of assets (such as an investment property) or a disposal group (which may include investment property), Section 4 *Statement of Financial Position* requires the following disclosures: [FRS 102.4.14]
 - A description of the asset(s) or the disposal group.
 - A description of the facts and circumstances of the sale.
 And
 - The carrying amount of the assets or, for a disposal group, the carrying amounts of the assets and liabilities within the disposal group.

Appendix I to FRS 102 defines a disposal group as "A group of assets to be disposed of, by sale or otherwise, together as a group in a single transaction, and liabilities directly associated with those assets that will be transferred in the transaction. The group includes goodwill acquired in a business combination if the group is a cash-generating unit to which goodwill has been allocated in accordance with the requirements of paragraphs 27.24 to 27.27 of this FRS." [FRS 102 Appendix I]. See Chapter 6 for further details.

- In addition to specific examples given in paragraph 11 of Section 32 *Events after the End of the Reporting Period*, if a decline in fair value of investment property between the end of the reporting period and the date when the financial statements are authorised for issue is material, an entity may need to give additional disclosure related to nature of the non-adjusting events and an estimate of its financial effect or a statement that such an estimate cannot be made. [FRS 102.32.7, FRS 102.32.10]. See Chapter 34 for further details.
- If a self-constructed property meets the definition of a qualifying asset and to the extent that the entity chooses to capitalise eligible borrowing costs to the cost of the qualifying asset as an accounting policy, the amount of borrowing costs capitalised in the period and the capitalisation rate would be required to be disclosed in accordance with Section 25 (see Chapter 27). [FRS 102.17.10].

4.5 Additional disclosures required by The Regulations

The following disclosures are required by the Regulations for investment properties measured at fair value through profit or loss in addition to those required by Section 16:

- The fair value and the changes in value included in the profit and loss account. [1 Sch 55, 2 Sch 66, 3 Sch 73].
 - The balance sheet items affected and the basis of valuation adopted in determining the amounts of the assets. [1 Sch 58, 2 Sch 69, 3 Sch 76].
 - The comparable amounts determined under the historical accounting rules (aggregate cost and cumulative depreciation) or the differences between the fair value and historical cost, had the asset always been recorded at historical cost. [1 Sch 58, 2 Sch 69, 3 Sch 76].
- And
- An analysis of land and buildings between freehold tenure and leasehold tenure splitting the land held on leasehold tenure between land held on long lease (50 years or more) and short lease. [1 Sch 53, 2 Sch 64, 3 Sch 71, 10 Sch 7].

5 Summary of GAAP differences

The key differences between FRS 102 and IFRS in accounting for investment properties (IP) are set out below.

FRS 102		IFRS
Measurement and recognition		
Measurement basis at initial recognition	If payment for the asset is deferred beyond normal credit terms, the cost is the present value of all future payments (see 3.2.1 above). Although expected to be materially similar, it is not the cash price equivalent at the recognition date like in IAS 40.	If payment for the asset is deferred beyond normal credit terms, interest is recognised over the period of credit i.e., the measurement of cost of IP is the cash price equivalent at the recognition date.
	No explicit requirements on exchanges of assets. It is expected to follow guidance in Section 17 (see 3.2.2 above) which is similar to IFRS except that any resulting gain or loss is likely to be an unrealised profit or loss and would be reported in other comprehensive income.	Subject to conditions (e.g., transaction has economic substance and fair value is reliably measurable), IAS 40 requires all acquisitions of IP in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value. Any resulting gain or loss is reported in the income statement.
Measurement basis after initial recognition	IP is measured at fair value, except for IP (or part of such property) rented to another group entity which can be accounted for in an entity's individual accounts either at fair value in accordance with Section 16 or by transferring the property to PP&E or to right-of-use assets and accounted for using the cost model in accordance with Section 17 or Section 20, respectively (see 3.3 and 3.1.2 above).	An entity has a choice between fair value or cost model in measuring IP, with certain exceptions for insurers and similar entities. While there is a choice between fair value or cost model in measuring IP, there is no option to classify a property rented to another group entity as PP&E or right-to-use asset in an entity's individual financial statements (see 2.1 above).
Inability to reliably measure fair value	If a reliable measure of fair value is no longer available for an asset measured at fair value, its carrying amount at the last date the asset was reliably measurable becomes its new cost. The entity measures the asset at this cost amount less impairment, if any, until a reliable measure of fair value becomes available (see 3.3.3 above). See also similar issue below which is specific to 'Mixed use properties'.	Only in exceptional cases and only on initial recognition (either by acquisition or change in use) that an entity will be able to conclude that it will not be able to reliably measure the IP's fair value on a continuing basis. If this exceptional situation occurs, that property is then measured using the cost model in IAS 16 (for owned IP) or in IFRS 16 (for IP held as a right-of-use asset) until disposal date and the property is assumed to have a nil residual value.

Mixed use properties	Separated if the IP and other property components can be sold separately or leased out under a finance lease separately but if fair value for the IP component cannot be measured reliably, the entire property is accounted for as PP&E or as right-of-use asset, whichever is applicable (see 3.1.7 above).	Separated if the IP and PP&E components can be sold or leased (under a finance lease) separately. It is only in exceptional cases and only on initial recognition (either by acquisition or change in use) that the entity will be able to conclude that it will not be able to reliably measure the IP's fair value on a continuing basis. In the event that no separation is possible, the entire property is accounted for as PP&E or as right-of-use asset, whichever is applicable, only if significant proportion is used for non-IP purposes (see 2.2 above).
Ancillary services	No guidance (see 3.1.3 above)	Where ancillary services are significant, a property must be accounted for as owner-occupied (i.e., PP&E) rather than as investment property.
Transfers of IP	Section 16 is silent on transfers of a revaluation surplus to retained earnings. However, the Regulations permit such transfers of amounts if the amount represents realised profit (see 3.4.2 above).	IAS 40 provides more detailed guidance on accounting of transfers of IP, including transfers of revaluation surplus to retained earnings i.e., when the related asset is derecognised.
Property held for provision of social benefits	Not classified as IP but accounted for as PP&E (see 3.1.6 above)	No specific guidance.
Disclosures - Fair value model		
Fair value measurement disclosures	The methods and significant assumptions applied in determining the fair value of investment property are disclosed. Section 16 refers to Section 2A for guidance on fair value measurements but no further disclosures are required.	IAS 40 refers to IFRS 13 for fair value measurements. IFRS 13 expands the disclosures related to fair value to enable users of financial statements to understand the valuation techniques and inputs used to develop fair value.
Classification of IP	No specific disclosure requirement although Section 8 would require disclosure of significant judgements made when applying accounting policies	Criteria used to distinguish IP from other assets, where classification is difficult is required to be disclosed by IAS 40
Reconciliation between carrying amounts at beginning and end of the period	The reconciliation need not be presented for prior periods (see 4.3 above)	Reconciliation of the relevant comparative period(s) must be disclosed

Reconciliation between valuation and carrying amounts	No explicit requirement to disclose reconciliation between valuation and carrying amounts. However, it is expected to provide such reconciliation (similar to IFRS), if adjustments are significant (see 4.3.1 above).	When a valuation obtained for investment property is adjusted significantly for the purpose of the financial statements, for example to avoid double-counting of assets or liabilities that are recognised separately (see 3.3.2.B above), the entity must disclose a reconciliation between the valuation obtained and the adjusted valuation included in the financial statements, showing separately the aggregate amount of any recognised lease liabilities that have been added back, and any other significant adjustments.
Inability to reliably measure fair value	For mixed use properties (see above), no other disclosures required other than the amounts of transfers to PP&E which are included in the reconciliation of carrying amounts of IP at beginning and end of the period. Entities, however, may consider providing similar disclosures required by IFRS for IP measured using cost, less any impairment, during the period that fair value cannot be measured reliably (see 4.3 above).	In addition to disclosing the reconciliation of carrying amounts at beginning and end of the period for such investment property separately from amounts relating to other investment property, extra disclosures are required by IAS 40 such as a description of the IP and reasons for why fair value cannot be reliably measured, possible range of estimates within which fair value is highly likely to lie, and specific details on subsequent disposal of such IP (i.e., the fact that the entity has disposed of IP not carried at fair value; the carrying amount of that IP at the time of sale and the amount of gain or loss recognised).
Expenses recognised in profit or loss	There are no specific expense items recognised in profit or loss that are required to be disclosed in the notes to the financial statements.	Amounts recognised in relation to direct operating expenses are required to be disclosed separately for let and vacant IP. For insurance companies and other entities which chooses different models to measure certain investment properties (see 2.1 above), the cumulative change in fair value recognised in P&L on a sale of IP from a pool of assets under the cost model into a pool of assets under the fair value model are required to be disclosed.

Appendix A - Defined terms

Extract from FRS 102

Appendix I

Glossary

asset	A present economic resource controlled by the entity as a result of past events.
carrying amount	The amount at which an asset, a liability or equity is recognised in the statement of financial position.
deemed cost	An amount used as a surrogate for cost or depreciated cost at a given date. Subsequent depreciation or amortisation assumes that the entity had initially recognised the asset or liability at the given date and that its cost was equal to the deemed cost.
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in Section 2A <i>Fair Value Measurement</i> shall be used in determining fair value. For the purposes of applying the lessor accounting requirements in Section 20, fair value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction.
group	A parent and all its subsidiaries.
investment property	Property (land or a building, or part of a building, or both) held by the owner, or by the lessee as a right-of-use asset, to earn rentals or for capital appreciation or both, rather than for: (a) use in the production or supply of goods or services or for administrative purposes; or (b) sale in the ordinary course of business.
owner-occupied property	A property held by the owner, or by the lessee as a right-of-use asset, for use in the production or supply of goods or services or for administrative purposes.
right-of-use asset	An asset that represents a lessee's right to use an underlying asset for the lease term.

Overview

This chapter deals with the requirements of Section 17 Property, Plant and Equipment ('Section 17'), which prescribes the accounting treatment for property, plant and equipment (PP&E). The principal issues in accounting for PP&E are determining the appropriate initial recognition and cost of assets, subsequent measurement of carrying amounts, and depreciation charges and impairment losses to be recognised in relation to them. Section 17 also prescribes the disclosures that an entity must provide about PP&E.

What you need to know

- Section 17 applies to all property, plant and equipment, unless explicitly excluded from its scope.
 - Other standards may require items similar to PP&E to be recognised on a different basis from that required by Section 17 (e.g., Section 20 Leases which prescribes the accounting treatment for leased assets).
 - Section 17 allows one of two alternatives to be chosen as the accounting policy for measurement of PP&E after initial recognition:
 - The cost model
 - Or
 - The revaluation model
- The choice must be applied to an entire class of PP&E.

1 Introduction

This chapter covers the accounting for property, plant and equipment and for investment property that is rented to another group entity when the reporting entity chooses to use the cost model as permitted by paragraph 4A of Section 16 *Investment Property* (see Chapter 19).

Overall, Section 17 is largely similar to IAS 16 *Property, Plant and Equipment*. Both Section 17 and IAS 16 have similar definitions of property, plant and equipment and require that such assets are initially recorded at cost and subsequently carried using either a cost model or a revaluation model. Revaluation gains and losses are recognised in the statement of other comprehensive income except for losses below cost (which are recognised in profit and loss) and for gains to the extent that they reverse previously recognised losses in profit and loss.

2 Comparison between Section 17 and IFRS

As discussed at 1 above, Section 17 is largely similar to IFRS. However, there are also certain key differences which are discussed at 2.1 to 2.7 below. The table at 4 below contains a summary of the major GAAP differences.

2.1 Accounting for non-current assets held for sale

For entities reporting under IFRS, IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* requires that an item of PP&E must be classified as held for sale if its carrying amount will be recovered principally through a sale transaction rather than continuing use, though continuing use is not in itself precluded for assets classified as held for sale. [IFRS 5.6]. Once this classification has been made, depreciation ceases, even if the asset is still being used, but the assets must be carried at the lower of their previous carrying amount and fair value less costs to sell. [IFRS 5.15].

In contrast, FRS 102 does not have a 'held-for-sale' category for non-current assets. Therefore, there is no reclassification of assets or suspension of depreciation - see 3.5.6.B below. However, in our view, if 'adapted formats' of presentation of the financial statements are used, an entity must generally continue to classify PP&E intended to be disposed of as non-current unless it is expected to be realised within 12 months after the reporting period, in which case it must be classified as current (see Chapter 6 at 4.1.3). A plan to dispose of an asset before the previously expected date is an indicator of impairment that triggers the calculation of the asset's recoverable amount for the purpose of determining whether the asset is impaired (see Chapter 29 at 4.3). [FRS 102.17.26].

2.2 Revenue-based depreciation method

The use of 'revenue expected to be generated' as the basis to depreciate PP&E is not explicitly prohibited under FRS 102 (see 3.6.5 below). In contrast, IAS 16 states that a depreciation method that is based on revenue which is generated by an activity that includes the use of an asset is not appropriate. [IAS 16.62A].

However, it must be noted that under both IAS 16 and Section 17, the depreciation method selected must reflect the pattern in which the asset's future economic benefits are expected to be consumed. The revenue generated by an activity that requires the use of an asset generally reflects factors other than the consumption of the economic benefits of the asset. Revenue reflects the output of the asset, but it also reflects other factors that do not affect depreciation, such as changes in sales volumes and selling prices, the effects of selling activities and other inputs and processes. The price component of revenue may be affected by inflation or foreign currency exchange rates. This means that revenue does not, as a matter of principle, reflect how an asset is used or consumed. Therefore, despite the fact that revenue-based depreciation is not explicitly prohibited under FRS 102, it would not be appropriate to select a revenue-based depreciation method where that did not reflect the consumption of the economic benefits of the asset.

2.3 Intra-group investment property

Under FRS 102 an entity can choose to bring investment properties rented to another group entity within the scope of Section 17 if it applies the cost model to their subsequent measurement (see 3.1 below).

This option is not available under IAS 40 *Investment Property* although IAS 40 permits cost less impairment as a measurement option. Under IAS 40 property rented to other group entities is classified as an investment property if it meets the definition of investment property.

2.4 Bearer plants

IAS 16 and IAS 41 *Agriculture* define a bearer plant as a living plant which is used in the production or supply of agricultural produce, is expected to bear produce for more than one period and has a remote chance of being sold as agricultural produce, except for incidental scrap sales. [IAS 16.6, IAS 41.5].

Section 34 *Specialised Activities* does not make a distinction between biological assets and bearer plants. Therefore, bearer plants are treated as biological assets and accounted for in accordance with Section 34.

In contrast, IAS 41 does distinguish between biological assets and bearer plants. Bearer plants are scoped out of IAS 41 and instead fall in the scope of IAS 16. [IAS 16.3(b), IAS 41.1].

2.5 Disposal of PP&E

Under FRS 102, gains and losses on disposal are calculated as the difference between any net disposal proceeds and the carrying value of the item of PP&E. [FRS 102.17.30]. Section 17 does not provide further guidance on how the disposal proceeds must be determined. However, IAS 16 requires that the amount of consideration on disposal to be included in the gain or loss on derecognition of PP&E must be determined in accordance with the requirements for determining the transaction price in IFRS 15 *Revenue from Contracts with Customers*. In addition, subsequent changes to the estimated amount of consideration included in the gain or loss must be accounted for in accordance with the requirements for changes in transaction price in IFRS 15. [IAS 16.72]. As a result of this the gain or loss on disposal calculated under FRS 102 may be different to that calculated under IAS 16. See 3.7 below for further details of the requirements in relation to derecognition of PP&E under FRS 102.

2.6 Income earned before an asset is available for use

Both IAS 16 and FRS 102 specify that the cost of an item of PP&E includes the costs of testing whether the asset is functioning properly. [IAS 16.17(e), FRS 102.17.10].

Sometimes, income may be earned from selling items produced when testing the functionality of an item of PP&E prior to it being available for use. Historically, entities applying IAS 16 and FRS 102 adopted a similar approach to accounting for such income. Specifically, it was an explicit requirement of IAS 16 and common practice under FRS 102, for entities to recognise cost after deducting the net proceeds from selling any items produced while bringing the asset to its location and condition (such as samples produced when testing equipment).

However, in May 2020, the IASB issued an amendment to IAS 16, which prescribes new accounting and disclosure requirements in respect of the accounting for proceeds from selling items produced while bringing an item of PP&E to the location and condition necessary for it to be capable of operating in the manner intended by management. Under the amendment, for IFRS reporters, proceeds from selling such items, and the cost of those items, must be recognised in profit or loss. The requirement to recognise the proceeds and related costs in profit and loss applies irrespective of whether those operations are necessary to bring the item to its intended location and operating condition.

FRS 102 has not been amended to reflect this amendment to IFRS, and the Standard does not contain further guidance relating to costs of testing whether the asset is functioning properly. However, FRS 102 states that income and related expenses of incidental operations during construction or development of an item of PP&E are recognised in profit or loss "if those operations are not necessary to bring the item to its intended location and operating condition". [FRS 102.17.12]. As such, it is common practice for income which an entity judges to be attributable to the testing of an assets functionality to be deducted from the cost of the item of PP&E under FRS 102. The amendments to IAS 16 may lead to differences arising in the measurement of cost between IFRS and FRS 102 for entities who earn income prior to items of PP&E being ready for their intended use.

2.7 Disclosures

The disclosure requirements of Section 17 (see 3.9 below) are less extensive than those of IAS 16. In addition, unlike IAS 16, Section 17 does not require comparative information to be presented in the reconciliation of the carrying amount from the beginning to the end of the reporting period. [FRS 102.17.31].

3 Requirements of Section 17 for property, plant and equipment

3.1 Scope of Section 17

Section 17 applies to the accounting for:

(a) PP&E

And

(b) Investment property that is rented to another group entity when the reporting entity chooses to use the cost model as permitted by paragraph 4A of Section 16 (see Chapter 19) *[FRS 102.17.1]*

Section 17 does not apply to:

- PP&E classified as investment property (see Chapter 19), except where the investment property is rented to another group company and the reporting entity chooses to apply the cost model.
- Biological assets related to agricultural activity (see Chapter 36).
- Heritage assets (see Chapter 36).

And

- Mineral rights and mineral reserves such as oil, gas, and similar 'non-regenerative' resources (see Chapter 36). *[FRS 102.17.3]*.

Although Section 17 scopes out biological assets and mineral resources, any PP&E used in developing or maintaining such resources would be within scope. Section 17 is silent as to whether a biological asset meeting the definition of a 'bearer plant' (e.g., fruit tree) is within its scope. However, Section 34 does not make a distinction between biological assets and bearer plants. Therefore, bearer plants are treated as biological assets and accounted for in accordance with Section 34 (see Chapter 36 at 2.3.2).

Other sections of FRS 102 may require an item of PP&E to be recognised on a basis different from that required by Section 17. For example, Section 20 *Leases* has its own rules regarding recognition and measurement. Under Section 20, for the majority of leases, a lessee recognises an asset on its balance sheet representing the right to use the underlying asset (i.e., the right-of-use asset). See Chapter 23 for a description of how an item of PP&E held under a lease is recognised and initially measured. Once a right-of-use asset has been recognised under Section 20, its treatment thereafter is in accordance with Section 17, unless it applies the fair value model for investment property held under a lease.

3.2 Recognition

An item of PP&E must be recognised (i.e., its cost included as an asset in the statement of financial position), only if it is probable that future economic benefits associated with the item will flow to the entity and if its cost can be measured reliably. *[FRS 102.17.4]*.

3.2.1 Aspects of recognition

3.2.1.A Spare parts and minor items

Spare parts, stand-by equipment and servicing equipment are recognised in accordance with Section 17 when they meet the definition of PP&E. Otherwise, such items are classified as inventory. *[FRS 102.17.5]*.

Materiality judgements are considered when deciding how an item of PP&E should be accounted for. Major spare parts may, for example, be considered as qualifying as PP&E, while smaller spares may be carried as inventory and as a practical matter many companies have a minimum value for capitalising assets.

Some types of business may have a very large number of minor items of PP&E such as spare parts, tools, pallets and returnable containers, which nevertheless are used in more than one accounting period. There are practical problems in recording these on an asset-by-asset basis in an asset register; they are difficult to control and frequently lost. The main consequence is that it becomes very difficult to depreciate them. Generally, entities write off such immaterial assets as expenses in the period of addition. Section 17 does not prescribe what actually constitutes a single item of PP&E. Therefore, in our view, entities must apply judgement in defining PP&E in their individual circumstances. It may be appropriate to aggregate some parts (such as tools, moulds and dies) and to apply the requirements of Section 17 to the aggregate amount (presumably without having to identify the individual assets).

3.2.1.B Environmental and safety equipment

There may be expenditures forced upon an entity by legislation that requires it to buy 'assets' that do not directly increase the expected future benefits expected to flow from the asset. Examples would be safety or environmental protection equipment. While Section 17 has no specific guidance, it would be reasonable to consider the related guidance in IFRS when accounting for such costs.

IAS 16 explains that the acquisition of such assets, although not directly increasing the future economic benefits of any particular existing item of PP&E, may be necessary for an entity to obtain the future economic benefits from its other assets. Therefore, such items of qualify for recognition because they enable an entity to derive future economic benefits from related assets in excess of what could be derived had those items not been acquired. For example, a chemical manufacturer may install new chemical handling processes to comply with environmental requirements. The entity may be unable to manufacture and sell the chemicals, or a plant might have to be closed down if these safety or environmental expenditures were not made. [IAS 16.11].

In addition, an entity may voluntarily invest in environmental equipment even though it is not required by law to do so. If the entity can demonstrate that the expenditure is likely to increase the economic life of a related asset or enables the entity to derive additional economic benefit working in conjunction with other assets, the expenditure meets the definition of an asset. Expenditure that relates to repairs and maintenance or that forms part of period costs or operational costs cannot be capitalised as an asset.

Consistent with IAS 16, whenever safety and environmental assets are capitalised, the resulting carrying amount of the asset, and any related asset, are required to be reviewed for impairment in accordance with Section 27 *Impairment of Assets* (see 3.5.6 below).

3.2.1.C Economic benefits and costs associated with property developments

Section 17 requires that PP&E is recognised only when it is probable that future economic benefits associated with the item will flow to the entity.

For example, in relation to property development, many jurisdictions require permissions prior to development whilst developers, including entities developing property for their own use, typically incur significant costs prior to such permissions being granted.

In assessing whether such pre-permission expenditures can be capitalised, assuming they otherwise meet the criteria, a judgement must be made at the date the expenditure is incurred of whether it is sufficiently probable that the relevant permission will be granted. Such expenditure does not become part of the cost of the land; to the extent that it can be recognised it will be as part of the cost of a separate building.

How we see it

If the granting of necessary permits is no longer expected during the application and approval process, capitalisation of pre-permission expenditures must cease and any related amounts that were previously capitalised should be written off in accordance with Section 27 and accordingly, the carrying amount of any related item of PP&E subject to development or redevelopment (or, if appropriate, the cash generating unit where such an asset belongs) must be tested for impairment, where applicable.

3.2.1.D Classification as PP&E or intangible assets

Certain intangible assets may be embedded or contained within an item of PP&E, and this can raise questions in determining whether such assets should be accounted for under Section 17 or Section 18 *Intangible Assets other than Goodwill*. In practice, items such as computer software purchased by entities are frequently capitalised as part of a tangible asset, for example as part of an accounting or communications infrastructure. Equally, internally written software may be capitalised as part of a tangible production facility, and so on. Judgement must be exercised in deciding whether such items are to be accounted for under Section 17 or Section 18, and this distinction becomes increasingly important if the two sections prescribe differing treatments in any particular case.

Section 17 does not refer to this type of asset. In contrast, Section 18 contains explicit guidance, stating that where an asset incorporates both intangible and tangible elements, an entity needs to exercise judgement in determining whether the asset should be treated as PP&E or as an intangible asset, for example:

- Computer software that is embedded in computer-controlled equipment that cannot operate without that specific software is an integral part of the related hardware and is treated as PP&E.

- Software which is not an integral part of the related hardware is treated as an intangible asset. For example, application software that is being used on a computer is generally easily replaced and is not an integral part of the related hardware, whereas the operating system normally is integral to the computer and is included in PP&E.

And

- A database that is stored on a compact disc is considered to be an intangible asset because the value of the physical medium is wholly insignificant compared to that of the data collection. [FRS 102.18.3B].

It is worthwhile noting that as the 'parts approach' in Section 17 (see 3.2.2 below) requires an entity to account for significant parts of an asset separately, this raises 'boundary' problems between Section 17 and Section 18 when software and similar expenditure are involved.

How we see it

We believe that where Section 17 requires an entity to identify significant parts of an asset and account for them separately, the entity needs to evaluate whether any software-type intangible part is integral to the larger asset or whether it is really a separate asset in its own right. The intangible part is more likely to be an asset in its own right if it was developed separately or if it can be used independently of the item of PP&E.

3.2.1.E Classification of items as inventory or PP&E when minimum levels are maintained

Entities may acquire items of inventory on a continuing basis, either for sale in the ordinary course of business or to be consumed in a production process or when rendering services.

This means there will always be a core stock of that item (i.e., a minimum level of inventory is maintained). This does not in itself turn inventory into an item of PP&E, since each individual item will be consumed in a single operating cycle. However, there may be cases where it is difficult to judge whether an item is part of inventory or is an item of PP&E. This may have implications on measurement because, for example, PP&E has a revaluation option (see 3.4 and 3.6 below) that is not available for inventory.

How we see it

In our view, an item of inventory is accounted for as an item of PP&E if it:

- Is not held for sale or consumed in a production process or during the process of rendering services.
- Is necessary to operate or benefit from an asset during more than one operating cycle.

And

- Cannot be recouped through sale (or is significantly impaired after it has been used to operate the asset or benefit from that asset).

This applies even if the part of inventory that is an item of PP&E cannot be physically separated from the rest of inventories.

When assessing whether 'core stock' must be classified as PP&E or inventories, an entity considers the definition of inventories. In doing so it must be noted that there is no reason why one should not distinguish assets with a different use, and account for them differently. Further, if the items are necessary to bring another item of PP&E to the condition necessary for it to be capable of operating in the manner intended by management, this meets the definition of cost of an item of PP&E in paragraph 17.10(b).

Consider the following scenarios:

Illustration 3-1: Classification of items as inventory or PP&E when minimum levels are maintained

Scenario 1

An entity acquires the right to use an underground cave for gas storage purposes for a period of 50 years. The cave is filled with gas, but a substantial part of that gas will only be used to keep the cave under pressure in order to be able to extract gas from the cave.

It is not possible to distinguish the gas that will be used to keep the cave under pressure and the rest of the gas (that is, it is not possible to identify the specific molecules in each of the two categories). Gas will be turned around on a continuing basis. Still, it is possible to measure the quantity of the gas that will not be recoupable from the cave for selling purposes.

In this scenario, the total volume of gas must be virtually split into (i) gas held for sale and (ii) gas held to keep the cave under pressure. The former must be accounted for under Section 13 *Inventories*. The latter is necessary to operate the cave over more than one operating cycle and must be accounted for as PP&E and depreciated over the period the cave is expected to be used.

Scenario 2

An entity operates an oil refining plant. In order for the refining process to take place, the plant must contain a certain minimum quantity of oil. This can only be taken out once the plant is abandoned and would then be polluted to such an extent that the oil's value is significantly reduced as it can only be sold as sludge.

In this scenario the part of the oil that is necessary to operate (in technical terms) the plant and cannot be recouped (or can be recouped but would then be significantly impaired), even when the plant is abandoned, must be considered as an item of PP&E and amortised over the life of the plant.

Scenario 3

An entity sells gas and has at any one time a certain quantity of gas in its gas distribution network.

In this scenario, the gas in the pipeline is not necessary to operate the pipeline. It is held for sale or to be consumed in the production process or process of rendering services. Therefore, this gas is accounted for as inventory.

In scenarios (1) and (2) above, recognising these items as inventories would lead to an immediate loss because these items cannot be sold or consumed in a production process or during the process of rendering services. This does not properly reflect the fact that the items are necessary to operate another asset over more than one operating cycle.

3.2.1.F Production stripping costs of surface mines

Under FRS 102, there is no specific guidance on production stripping costs of surface mines. However, the approach in Section 17 in relation to accounting for parts (see 3.2.2 below) seems to be consistent with the specific guidance provided in IFRS.

IFRIC 20 *Stripping Costs in the Production Phase of a Surface Mine* states that costs associated with a 'stripping activity asset' (i.e., the costs associated with gaining access to a specific section of the ore body) are accounted for as an additional component of an existing asset. [IFRIC 20.10]. Other routine stripping costs are accounted for as current costs of production (i.e., inventory).

The Interpretations Committee's intention was to maintain the principle of IAS 16 by requiring identification of the 'component' of the ore body for which access had been improved, as part of the criteria for recognising stripping costs as an asset. An entity will have to allocate the stripping costs between the amount capitalised (as it reflects the future access benefit) and the amount that relates to the current-period production of inventory. This allocation must be based on a relevant production measure.

This component approach follows the principle of separating out parts of an asset that have costs that are significant in relation to the entire asset and when the useful lives of those parts are different. [IAS 16.44].

This interpretation is discussed in more detail in the most recent version of the EY publication International GAAP®.

3.2.1.G Expenditure on the development of infrastructure relating to new technologies

An entity may incur expenditure on the development of infrastructure relating to new technologies. One instance in which this may be particularly relevant is those entities incurring expenditure arising from the need to address impacts of climate change (e.g., hydrogen processing or carbon capture and storage (CCS) facilities). Such development costs are recognised as an item of PP&E if it is probable that future economic benefits associated with the item will flow to the entity and the cost of the item can be measured reliably. [FRS 102.17.4]. The entity will need to consider at which point there is sufficient and reliable information to meet the PP&E recognition criteria. This is key as there will likely be more uncertainty about the total project costs of assets relating to new technologies compared to existing technologies. Therefore, there is greater potential for significant time and cost overruns.

3.2.1.H Aggregation of items of PP&E

Entities may have items of PP&E that are considered insignificant at the overall entity level because the entity is of such a size that the individual assets are considered insignificant to the entity as a whole. As described in section 3.2.1.A above, Section 17 does not prescribe the 'unit of measure' for recognition, i.e., what constitutes an item of PP&E and the extent to which items can be aggregated. It would be reasonable to refer to the guidance in IAS 16 in this regard, which notes that it may be appropriate to aggregate individually insignificant items such as moulds, tools and dies, and to apply the standard to the aggregate value. [IAS 16.9]. However, it is noted that IAS 16 is silent on whether this approach may be used to aggregate properties or similar assets that are individually immaterial.

There are instances in which the aggregation of items on the grounds that they are immaterial to the entity purely by virtue of their size may result in accounting that is inconsistent with the broader requirements of Section 17. For example, the aggregation of individually immaterial assets into a single asset could lead to a factory being considered a single asset, instead of distinguishing between the land, buildings, plant and machinery, which would clearly be against both the letter and spirit of Section 17. The following illustration shows another situation:

Illustration 3-2: Aggregation of individual properties

An entity owns a large number of individual properties from which it earns both rental income and other trading income, such that the properties do not meet the definition of investment properties under Section 16. The entity applies the revaluation model for subsequent measurement of its properties.

Each property is individually immaterial to the entity. Nevertheless, each property is recorded separately in the entity's books and records, is monitored separately by management and generates individual cash flows. Therefore, each individual property is regarded as a separate item of PP&E under Section 17.

If such an entity did aggregate all its properties, any downward revaluations on individual properties to the income statement would be inappropriately offset by revaluation gains arising on other properties within the aggregated group.

How we see it

FRS 102 is silent on the issue of aggregation of items of PP&E. It would be reasonable for entities to consider the requirements of paragraph 9 of IAS 16 in developing their accounting policy for PP&E, but in doing so, it is our view that paragraph 9 applies to small items (such as tools) that are capitalised together into a single amount and are not subsequently viewed by management or monitored as single assets. In our view, the paragraph cannot be used to justify the aggregation of individual assets if the entity itself views and monitors the assets individually, the assets generate separately identifiable cash flows or the assets are subject to separate contractual arrangements.

3.2.2 Accounting for parts ('components') of assets

Section 17 requires entities to identify major parts of items of PP&E on initial recognition. This is necessary for two reasons:

- In order to apply the depreciation requirements where the major components of an asset have different patterns of consumption of economic benefits (see 3.2.2.A).
And
- In order to apply the derecognition requirements when part of an item of PP&E is replaced (see 3.2.3).
[FRS 102.17.6, FRS 102.17.16]

Section 17 uses the terms 'part' and 'component' although neither term is defined. The process of identifying and separately recognising the major components of an item PP&E is often referred to as 'componentisation'.

3.2.2.A Identifying 'major components' for depreciation purposes

The initial cost of an item of PP&E to be allocated to its 'major components' and each component must be depreciated separately where there are different patterns of consumption of economic benefits.

[FRS 102.17.6, FRS 102.17.16]. Therefore, an entity will have to identify the major components of the asset on initial recognition in order to depreciate the asset appropriately. There is no requirement to identify all components, only major components.

The unit of measurement to which Section 17 applies (i.e., what comprises an item of PP&E) is not itself defined. Therefore, the identification of major components will require the exercise of judgement after considering the specific facts and circumstances. However, components that have a cost that is significant in relation to the total cost of the asset will usually be a 'major component'.

Components may be physical components, but where relevant, non-physical parts may also be identified to reflect the need for the asset to undergo major inspections or overhauls. Major inspections are discussed further in section 3.2.3.B below. The separation of an asset into major physical components is illustrated in Illustration 3-3.

Illustration 3-3: Identification of major components for depreciation purposes

An entity buys a property with an estimated useful life of 25 years for £4 million. The property's roof is expected to require replacement every 10 years at an estimated cost of £250,000. The building is also internally configured using partition walls to create the required workspaces (such as open plan areas and meeting rooms), and this internal configuration is expected to be replaced every 7 years at an estimated cost of £350,000.

The entity is required under IAS 16 to allocate the amount initially recognised to its significant parts, and therefore it determines that it should:

- Regard the roof as a significant part with a cost of £250,000 and a useful life of 10 years.
 - Regard the internal partitioning as a significant part with a cost of £350,000 and a useful life of 7 years.
- And
- The remaining cost of £3.4 million should be allocated to the building component with a useful life of 25 years.

As set out at 3.2.2 above, in addition to the requirement to componentise for depreciation purposes, Section 17 requires entities to derecognise an existing part or component when it is replaced, regardless of whether it has been depreciated separately. The accounting for subsequent expenditure on replacement of parts is discussed further at 3.2.3 and 3.2.3.A below.

3.2.2.B Land and buildings

Section 17 requires that the land and the building elements of property are treated as separate assets and accounted for separately, even when they are acquired together. [FRS 102.17.8].

3.2.3 Initial and subsequent expenditure

Section 17 makes no distinction in principle between the initial costs of acquiring an asset and any subsequent expenditure upon it. In both cases any and all expenditure must meet the recognition rules, and be expensed in profit or loss if it does not.

A distinction is drawn between servicing and more major expenditures. Day-to-day servicing (e.g., repairs and maintenance of PP&E, which largely comprises labour costs and minor parts) must be recognised in profit or loss as incurred. [FRS 102.17.15]. However, if the cost involves replacing a part of the asset, this replacement part must be recognised, i.e., capitalised as part of the PP&E, if the recognition criteria are met. The carrying amount of the part that has been replaced must be derecognised. [FRS 102.17.6].

Identification of parts is discussed at 3.2.2 above and the accounting for replacement parts is discussed further at 3.2.3.A below.

3.2.3.A Subsequent expenditure on replacement of parts

When discussing subsequent expenditure, Section 17 states that parts of some items of PP&E may require replacement at regular intervals. [FRS 102.17.6]. Examples of parts which may require replacement at regular intervals during the life of the asset include the roofs of buildings, relining a furnace after a specified number of hours of use, or replacing the interiors of an aircraft several times during the life of the airframe. There could also be parts which may involve less frequently recurring replacements, such as replacing the interior walls of a building.

Section 17 does not state that replacement expenditures necessarily qualify for recognition. For example, aircraft interiors are clearly best treated as separate components as they have a useful life different from that of the asset of which they are part. With the other examples, such as interior walls, it is less clear why they meet the recognition criteria. However, replacing internal walls or similar expenditures may extend the useful life of a building while upgrading machinery may increase its capacity, improve the quality of its output or reduce operating costs. Hence, this type of expenditure may give rise to future economic benefits.

Entities are required to derecognise the carrying amount of an existing part when it is replaced, regardless of whether it has been depreciated separately. If it is impracticable for an entity to identify the carrying amount of the replaced part, it may be estimated using the current cost of the replacement part as a proxy for the original cost of the replaced part and adjusting it for depreciation and impairment. [FRS 102.17.6]. This is consistent with the treatment for 'major inspections' discussed at 3.2.3.B below.

Given there is no requirement to identify all components, in practice an entity may not actually identify the parts or components of an asset until it incurs the replacement expenditure, as in the following Illustration.

Illustration 3-4: Recognition and derecognition of parts

An entity buys a piece of machinery with an estimated useful life of ten years for £10 million. The asset contains two identical pumps, which are assumed to have the same useful life as the machine of which they are a part. After seven years one of the pumps fails and is replaced at a cost of £200,000. The entity had not identified the pumps as separate parts and does not know the original cost. It uses the cost of the replacement part to estimate the carrying value of the original pump. With the help of the supplier, it estimates that the cost would have been approximately £170,000 and that this would have a remaining carrying value after seven year's depreciation of £51,000. Accordingly, it derecognises £51,000 and capitalises the cost of the replacement.

3.2.3.B Cost of major inspections

A condition of continuing to operate an item of PP&E (e.g., a bus) may include a requirement to perform regular major inspections for faults regardless of whether parts of the item are replaced. When a major inspection is performed, Section 17 requires the cost of the inspection to be recognised in the carrying amount of the item of PP&E as a replacement (and considered a separate part) if the recognition criteria are satisfied (see 3.2 above). [FRS 102.17.7].

This approach maintains a degree of consistency with Section 21 *Provisions and Contingencies* which prohibits an entity from making provisions if there are no obligations. Therefore, an entity is prohibited by Section 21 from making, for example, a provision to overhaul an owned aircraft engine by annually providing for a quarter of the cost for four years and then utilising the provision when the engine is overhauled in the fourth year. Instead, the cost of a major inspections is added to the asset's cost if the recognition criteria are satisfied and then depreciated over the period until the next major inspection.

Any remaining carrying amount of the cost of the previous major inspection (as distinct from physical parts) is derecognised. In the same way as described at 3.2.3.A above for replacement parts more generally, this is done regardless of whether the cost of the previous major inspection was identified in the transaction in which the item was acquired or constructed. If necessary, the estimated cost of a future similar inspection may be used as an indication of what the cost of the existing inspection component was when the item was acquired or constructed. [FRS 102.17.7]. Accordingly, if the element relating to the inspection had previously been identified, it would have been depreciated between that time and the current overhaul and its carrying amount would be known. However, if it had not previously been identified, Section 17 allows the entity to reconstruct the carrying amount of the previous inspection (i.e., to estimate the net depreciated carrying value of the previous inspection that will be derecognised using the estimated cost of a future similar inspection as an indication of the cost of the existing inspection component that must be derecognised).

These principles may need to be considered by entities which are required to undertake major overhauls or redesigns of items of PP&E as a result of the impacts of climate change on their business. To the extent that such activities result in the replacement of asset parts, entities will need to apply the 'major inspection and overhaul' principles of Section 17 in determining the appropriate treatment.

3.2.4 Properties with mixed use

There may be instances where a property has mixed use, for example, it could be partly owner-occupied and partly held for rental. Section 16 provides guidance relating to the allocation of mixed-use property between investment property and PP&E (see Chapter 19 at 3.1.7).

3.3 Measurement at initial recognition

Section 17 draws a distinction between measurement at initial recognition (i.e., the initial treatment of an item of PP&E on acquisition) and measurement after initial recognition (i.e., the subsequent treatment of the item). Measurement after initial recognition is discussed at 3.4, 3.5 and 3.6 below.

Section 17 states that "an entity shall measure an item of property, plant and equipment at initial recognition at its cost". [FRS 102.17.9]. What may be included in the cost of an item is discussed below.

3.3.1 Elements of cost and cost measurement

FRS 102 sets out what constitutes the cost of an item of PP&E on initial recognition: [FRS 102.17.10]

Extract from Section 17

- 17.10** The cost of an item of property, plant and equipment comprises all of the following:
- (a) Its purchase price, including legal and brokerage fees, import duties and non-refundable purchase taxes, after deducting trade discounts and rebates.
 - (b) Any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management. These can include the costs of site preparation, initial delivery and handling, installation and assembly, and testing of functionality.
 - (c) The initial estimate of the costs, recognised and measured in accordance with Section 21 *Provisions and Contingencies*, of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period.
 - (d) Any borrowing costs capitalised in accordance with paragraph 25.2.

Item (c) above requires that site restoration and other environmental restoration and similar costs be estimated and capitalised at initial recognition, in order that such costs can be recovered over the life of the item of PP&E, even if the expenditure will only be incurred at the end of the item's life. The obligations are calculated in accordance with Section 21.

A common instance of (c) is dilapidation obligations in lease agreements, under which a lessee is obliged to return premises to the landlord in an agreed condition. Arguably, a provision is required whenever the 'damage' is incurred. Therefore, if an entity rents a building and constructs a dividing wall to convert the single building into two premises, and has an obligation to make good at the end of the lease term, the tenant must immediately provide for the costs of so doing. The 'other side' of the provision entry is an asset that will be amortised over the lease term. This reflects the fact that the cost to the tenant of the leasehold improvement includes both the cost of constructing the dividing wall, but also the resulting costs which the entity will have to incur in the future to restore the property.

Obligations that arise as a result of using the asset to produce inventories during a particular period are not capitalised as part of the item of PP&E. These are production costs and are included in the cost of inventories. Such costs are dealt with in accordance with Section 13 (discussed in Chapter 16 at 3.2). Obligations that arise due to general use (for example, costs associated with wear and tear arising from the use of a leasehold building for administrative purposes) are expensed as incurred.

3.3.1.A 'Directly attributable' costs

This is the key issue in the measurement of cost. Section 17 gives examples of types of expenditure that are, and are not, considered to be directly attributable. The following are examples of those types of expenditure that are considered to be directly attributable and hence must be included in cost at initial recognition: [FRS 102.17.10(b)]

- Costs of site preparation.
- Initial delivery and handling costs.
- Installation and assembly costs.

And

- Cost of testing of functionality.

Costs are only eligible for capitalisation until the point at which the asset has been brought to the location and condition for it to be capable of being operated in a manner intended by management. However, FRS 102 does not provide guidance on assessing the point at which this has occurred, and therefore, judgement may be required in determining the period during which testing costs must be capitalised. While FRS 102 has no further guidance relating to the measurement of costs of testing whether the asset is functioning properly, it is reasonable and common practice to recognise costs after deducting the net proceeds from selling any items produced while bringing the asset to its location and condition (such as samples produced when testing equipment). Income received during the period of construction of PP&E is considered further at 3.3.2 below.

How we see it

In our view, the depreciation charge associated with right-of-use assets during the construction period of an asset may also be a directly attributable cost to be included as part of the cost of the PP&E if those lease costs are 'directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management'. This may be the case, for example, where a building is constructed on land that is leased. Determining whether the depreciation expense associated with a right-of-use asset is directly attributable requires judgement, taking into account all relevant facts and circumstances.

Certain types of expenditure are not directly attributable costs associated with an item of PP&E and therefore, cannot be recognised as part of the cost of an asset. This must be considered in assessing whether a lease cost is included in the cost of an item of PP&E. Some specific examples of ineligible costs are discussed further at 3.3.1.C below. The prohibition from including general overheads and costs related to opening a new facility in the cost of an item of PP&E may be particularly relevant when assessing whether lease costs should be capitalised.

Other types of costs expected to be considered to be directly attributable costs are the following:

- Costs of employee benefits (as defined in Section 28 *Employee Benefits*) arising directly from the construction or acquisition of the item of PP&E. This means that the labour costs of an entity's own employees (e.g., site workers, in-house architects and surveyors) arising directly from the construction, or acquisition, of the specific item of PP&E may be recognised.

And

- Professional fees.

3.3.1.B Borrowing costs

Entities are not required to capitalise borrowing costs. However, in line with item (d) at 3.3.1 above and Section 25 *Borrowing Costs*, such costs may be capitalised in respect of certain qualifying assets to the extent that the entity has made an accounting policy choice to capitalise borrowing costs in respect of such assets. A qualifying asset is "an asset that necessarily takes a substantial period of time to get ready for its intended use or sale". [FRS 102 Appendix I]. The treatment of borrowing costs is discussed separately in Chapter 27.

3.3.1.C Costs that are not PP&E costs

The following costs are not costs of PP&E and must be recognised as an expense when they are incurred: [FRS 102.17.11]

- Costs related to opening a new facility.
 - Costs of introducing a new product or service (including costs of advertising and promotional activities).
 - Costs of conducting business in a new territory or with a new class of customer (including costs of staff training).
- And
- Administration and other general overhead costs.

Administration and other general overhead costs are not costs of an item of PP&E. This means that employee costs not related to a specific asset, such as site selection activities and general management time, do not qualify for capitalisation. Entities are also not allowed to recognise so-called 'start up costs' as part of the item of PP&E. These include costs related to opening a new facility, introducing a new product or service (including costs of advertising and promotional activities), conducting business in a new territory or with a new class of customer (including costs of staff training) and similar items. [FRS 102.17.11]. These costs must be accounted for in the same way as similar costs incurred as part of the entity's on-going activities (in general, expensed as incurred).

3.3.1.D Cessation of capitalisation

Only those costs directly attributable to bringing the asset to the location and condition for it to be capable of being operated in a manner intended by management can be capitalised. [FRS 102.17.10(b)]. Once that has occurred capitalisation must cease. This will usually be the date of practical completion of the physical asset.

An entity is not precluded from continuing to capitalise costs during an initial commissioning period that is necessary for installation or assembly or testing equipment. In contrast, no new costs should be capitalised if the asset is fully operational but is not yet achieving its targeted output, usage or profitability because demand is still building up, for example in a new hotel that initially has high room vacancies. In these cases, the asset is clearly in the location and condition necessary for it to be capable of operating in the manner intended by management.

Entities need to identify the point at which major assets are considered to be in the location and condition necessary for it to be capable of operating in the manner intended by management and apply that policy consistently.

3.3.1.E Self-built assets

Section 17 is silent on construction costs of an item of self-built PP&E. If an asset is self-built by the entity, the same general principles apply as for an acquired asset i.e., only those costs directly attributable to bringing the asset to the location and condition for it to be capable of being operated in a manner intended by management can be capitalised. This includes assembly costs. [FRS 102.17.10(b)]. Consistent with IAS 16 and common practice, abnormal amounts of wasted resources, whether labour, materials or other resources, must not be included in the cost of self-built assets. [IAS 16.22]. Section 25, discussed in Chapter 27, contains criteria relating to the recognition of any interest as a component of a self-built item of PP&E (in instances in which an entity has selected an accounting policy of capitalising eligible borrowing costs).

If the same type of asset is made for resale by the business, it must be recognised at cost of production, but including attributable overheads in accordance with Section 13 (see Chapter 16 at 3.2). [FRS 102.13.8, FRS 102.13.9].

3.3.1.F Deferred payment

The cost of an item of PP&E is its cash price equivalent at the recognition date. This means that if payment is made in some other manner, the cost to be capitalised is the normal cash price. If the payment terms are extended beyond 'normal' credit terms, the cost to be recognised must be the present value of all future payments. [FRS 102.17.13]. Accordingly, any difference between the present value and the total payments must be treated as an interest expense over the period of credit, unless such interest is capitalised in accordance with Section 25 (see 3.3.1.B above). Right-of-use assets are discussed in Chapter 23.

3.3.1.G Land and buildings to be redeveloped

It is common for property developers to acquire land with an existing building where the planned redevelopment necessitates the demolition of that building and its replacement with a new building that is to be held to earn rentals or will be owner-occupied. As discussed in 3.2.2.B above, Section 17 requires that the land and the building elements of property are treated as separate assets and accounted for separately, even when they are acquired together. [FRS 102.17.8].

How we see it

In our view, if the existing building is unusable or likely to be demolished by any party acquiring it, it is appropriate for the entire, or a large part of, the purchase price be allocated to land. Similarly, subsequent demolition costs should be treated as being attributable to the cost of the land.

Owner-occupiers may also replace existing buildings which are in use within their business with new facilities for their own use or to rent to others.

How we see it

Here the consequences are different and the carrying amount of the existing building cannot be rolled into the costs of the new development. The existing building must be depreciated over its remaining useful life to reduce the carrying amount of the asset to its residual value (presumably nil) at the point at which it is demolished.

Consideration must be given as to whether the asset is impaired in accordance with Section 27. Many properties do not directly generate independent cash inflows (i.e., they are part of a cash-generating unit) and reducing the useful life will not necessarily lead to an impairment of the cash-generating unit, although by the time the asset has been designated for demolition it may no longer be part of a cash-generating unit (see Chapter 29).

Developers or owner-occupiers replacing an existing building with a building to be sold in the ordinary course of their business will deal with the land and buildings under Section 13 (see Chapter 16 at 3.1.1.B).

3.3.1.H Transfers of assets from customers

An entity may be entitled to consideration in the form of goods, services or other non-cash consideration (e.g., PP&E), in exchange for transferring goods or services to a customer. Examples include:

- A supplier who receives a contribution to the development costs of specific tooling equipment from another manufacturer to whom the supplier will sell parts, using that specific tooling equipment under a supply agreement.
- Suppliers of utilities who receive items of PP&E from customers that are used to connect them to a network through which they will receive ongoing services (e.g., electricity, gas, water or telephone services). A typical arrangement is one in which a builder or individual householder must pay for power cables, pipes, or other connections.
- In outsourcing arrangements, the existing assets are often contributed to the service provider, or the customer must pay for assets, or both.

Section 17 has no specific guidance on transfers of assets from customers other than for circumstances when the transfer involves an exchange of assets - see 3.3.4 below. However, relevant principles exist in other sections of FRS 102.

When an entity (i.e., the seller or vendor) receives, or expects to receive, non-cash consideration from a customer in relation to a revenue contract that is within the scope of Section 23 *Revenue from Contracts with Customers*, the fair value of the non-cash consideration is included in the transaction price.

[FRS 102.23.61]. The Section 23 requirements regarding non-cash consideration are discussed in Chapter 25.

FRS 102 does not then address the initial measurement of any asset arising from the non-cash consideration, however the Basis for Conclusions on IFRS 15 (the IFRS accounting standard on which Section 23 is based) states that "once recognised, any asset arising from the non-cash consideration would be measured and accounted for in accordance with other relevant requirements ..." (e.g., IAS 16).

[IFRS 15.BC253]. As such, for an IFRS reporter, the fair value measured in accordance with IFRS 15 would be the deemed cost of the item of PP&E on initial recognition. Applying similar principles, under FRS 102, the fair value measured in accordance with Section 23 would be the deemed cost of the item of PP&E on initial recognition under Section 17.

Outside of transactions in the scope of Section 23, transfers that are government grants are within the scope of Section 24 *Government Grants* (discussed in Chapter 26). Assets used in a service concession or resources from non-exchange transactions are within the scope of Section 34 (see Chapter 36). Accordingly, an entity applying FRS 102 may use the principles set out in these sections of FRS 102 and at 3.3.4 below i.e., recognition of the asset transferred at fair value. [FRS 102.17.14, FRS 102.24.5].

3.3.1.I Variable consideration

The purchase price of an item of PP&E might include variable or contingent amounts. The final purchase price of an item of PP&E is not known when the terms include a variable or contingent amount that is linked to future events that cannot be determined at the date of acquisition. The total consideration could vary based on the performance of an asset - for example, the revenue or EBITDA generated, for a specified future period, by the asset or a business in which the asset is used. Some arrangements can contain more than one source of variability.

Generally, where the payment of variable or contingent consideration is outside the control of both the buyer and the seller, we expect that the obligation to make the payment(s) would meet the definition of a financial liability, to be accounted for by applying Section 12 *Other Financial Instruments Issues*, and should be recognised when the item of PP&E is purchased. [FRS 102.22.3A]. This means that any measurement changes to that liability would be recorded in the statement of profit or loss. However, in some instances contracts are more complex and it can be argued that the subsequent changes to the initial estimate of the purchase price must be capitalised as part of the cost of the asset, similar to changes in a decommissioning liability (see 3.3.3 below). Further, many consider that these are executory payments that are not recognised until incurred.

How we see it

In the absence of specific guidance, an entity develops an accounting policy for variable consideration relating to the purchase of PP&E in accordance with the hierarchy in Section 10 *Accounting Policies, Estimates and Errors*. An entity must exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in its particular circumstances.

In practice, there are different approaches for treating the estimated future variable payments. Some entities do not capitalise these amounts upon initial recognition of the asset and then either expense or capitalise any payments as they are incurred. Other entities include an estimate of future amounts payable on initial recognition with a corresponding liability being recorded. Under this approach subsequent changes in the liability are either capitalised or expensed.

3.3.1.J Acquisition of a group of assets

The purchase price of an individual item of PP&E may be an allocation of the price paid for a group of assets. Where an item of PP&E is acquired as part of a collection of assets, entities are required to apply judgement to determine whether the transaction is the acquisition of a group of assets or a business combination within the scope of Section 19 *Business Combinations and Goodwill*. [FRS 102.17.3A]. FRS 102 does not provide specific guidance when an entity acquires a group of assets that do not comprise a business. However, it is clear that the entity must identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for intangible assets in Section 18) and liabilities assumed. The cost of the group of assets would be allocated to the individual identifiable assets and liabilities on a reasonable and consistent basis. For example, the principles in Section 19 could be applied to allocate the entire cost to individual items (see Chapter 22), except for the fact that, in this case, such allocation does not give rise to goodwill.

3.3.1.K Dismantling and restoration costs

Section 17 requires the initial estimate of the costs, recognised and measured in accordance with Section 21, of dismantling and removing an item of PP&E and restoring the site on which it is located to be included as part of the item's cost. This applies whether the obligation is incurred when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period.

3.3.1.L Cost of property, plant and equipment acquired in a business combination

When PP&E is acquired as part of a business combination, those items are initially measured at their acquisition-date fair values. This acquisition date fair value forms the cost of the asset for the purposes of subsequent measurement. The accounting for business combinations under Section 19 is discussed in Chapter 22.

3.3.2 Incidental and non-incidental income

The cost of an item of PP&E includes any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management.

[FRS 102.17.10(b)]. However, during the construction of an asset, an entity may enter into incidental operations that are not, in themselves, necessary to meet this objective.

Using a building site as a car park prior to starting construction is an example of an incidental operation. Income and expenses related to incidental operations are recognised in profit or loss because incidental operations during construction or development of PP&E are not necessary to bring an item to the location and operating condition intended by management. [FRS 102.17.12]. These income and expenses would be included in their respective classifications of income and expense in profit and loss and not included in determining the cost of the asset.

However, in some cases, income is generated wholly and necessarily as a result of the process of bringing the asset into the location and condition for its intended use, for example from the sale of samples produced when testing the equipment concerned to determine whether the asset is functioning properly. It has historically been considered reasonable and common practice for FRS 102 reporters to reduce the cost of such testing by the net proceeds from selling any items produced while bringing the asset to that location and condition. This approach was consistent with the requirements for entities applying IAS 16, prior to an amendment made to IAS 16 in May 2020 ("*Property, Plant and Equipment - Proceeds before Intended Use (Amendments to IAS 16)*"), but this is now an area of difference between Section 17 and IAS 16. See 2.6 above for further discussion.

It will be a matter of judgement as to when the asset is in the location and condition intended by management, but capitalisation (including the recording of income as a credit to the cost of the asset) ceases when the asset is fully operational, regardless of whether it is yet achieving its targeted levels of production or profitability.

If the asset is already in the location and condition necessary for it to be capable of being used in the manner intended by management then capitalisation must cease and depreciation must start. In these circumstances all income earned from using the asset must be recognised as revenue in profit or loss and the related costs must include an element of depreciation of the asset.

3.3.2.A Income received during the construction of property

One issue that commonly arises is whether rental and similar income generated by existing tenants in a property development may be capitalised and offset against the cost of developing that property.

The relevant question is whether the leasing arrangements with the existing tenants are a necessary activity to bring the development property to the location and condition necessary for it to be capable of operating in the manner intended by management. The building could be developed even if it was vacant (i.e., there were no existing tenants) and therefore the leasing arrangement is not a necessary activity.

Therefore, rental and similar income from existing tenants is incidental to the development and must not be capitalised. Rather rental and similar income must be recognised in profit or loss in accordance with the requirements of Section 20 together with related expenses.

3.3.2.B Liquidated damages during construction

Income may arise in other ways, for example, liquidated damages received as a result of delays by a contractor constructing an asset.

Normally, purchasing PP&E does not give rise to income. Therefore, in the absence of specific reference to compensating for losses in a liquidated damage clause, the liquidated damages received are treated as a reduction in the cost of the related assets.

The rationale for this approach is consistent with the conclusion that, rather than damages for delay, the contract provides for an additional payment in the event of early completion. For example, a contract having a value of £1,000 in which the supplier incurs a £100 penalty for late delivery after 1 January 20X0 is in substance the same as a contract with a value of £900 in which the supplier is entitled to an additional payment of £100 for an early completion before 1 January 20X0. Therefore, the cost of the asset is the total price paid to acquire it, including the premium for early completion (i.e., £1,000 if finished before 1 January 20X0 and £900 if finished after 1 January 20X0). This gives the same result as with liquidated damages.

However, when the liquidated damages clause in a contract refers to compensating the affected party for any revenue lost or reimbursement of specific costs incurred because of delay in the completion of the project, then recognising as income or deducting against specifically reimbursed costs is more consistent with the purpose of the liquidated damages clause.

How we see it

Normally, such damages received must be set off against the asset cost - the purchase price of the asset is reduced to compensate for delays in delivery. However, if the agreement specifically provides liquidated damages to compensate for loss of revenue arising because of contract delays, and the basis is clearly related to income lost, then the damages received are recognised as income.

3.3.3 Accounting for changes in decommissioning and restoration costs

Section 17 requires the initial estimate of the costs of dismantling and removing an item of PP&E and restoring the site on which it is located to be included as part of the item's cost. This applies whether the obligation is incurred when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period (see 3.3.1.K above). [FRS 102.17.10(c)]. However, Section 17 does not address the extent to which an item's carrying amount must be affected by changes in the estimated amount of dismantling and site restoration costs that occur after the estimate made upon initial measurement. Accordingly, an entity may consider the approach applied by IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities* (see Chapter 24 at 3.11.1). IFRIC 1 applies to any decommissioning, restoration or similar liability that has been both included as part of the cost of an asset measured in accordance with IAS 16 (or Section 17) and recognised as a liability in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (or Section 21). [IFRIC 1.2]. It deals with the impact of events that change the measurement of an existing decommissioning, restoration or similar liability. Events include a change in the estimated cash flows, a change in the discount rate and the unwinding of the discount. [IFRIC 1.3].

Detailed discussion and requirements of IFRIC 1 can be found in the most recent version of the EY publication, International GAAP®.

The effects of climate change may have implications for an entity's decommissioning liabilities. If the useful life of an item of PP&E is shorter than previously expected (see 3.5.3 below), this would result in earlier decommissioning and would (assuming a positive discount rate) increase both the decommissioning provision and the decommissioning component of the asset as a result of the discounting effect. In addition, it must be noted that IFRIC 1 creates profit and loss volatility in the case of end-of-life assets which have a carrying amount that is small compared to the potential movements in the decommissioning liability.

3.3.4 Exchanges of assets

An entity might swap an asset it does not require in a particular area, for one it does from another area - the opposite being the case for the counterparty. Such exchanges are common in the telecommunications, media and leisure businesses, particularly after an acquisition, as well as in extractive industries. Governmental competition rules sometimes require such exchanges. The question arises whether such transactions give rise to a gain in circumstances where the carrying value of the outgoing facility is less than the fair value of the incoming one. This can occur when carrying values are less than market values, although it is possible that a transaction with no real commercial substance could be arranged solely to boost apparent profits.

Section 17 requires all acquisitions of PP&E in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value, unless:

(a) The exchange transaction lacks commercial substance.

Or

(b) The fair value of neither the asset received nor the asset given up is reliably measurable.

In that case, the asset's cost is measured at the carrying amount of the asset given up. [FRS 102.17.14].

The recognition of income from an exchange of assets does not depend on whether the assets exchanged are dissimilar. If fair value cannot be reliably measured for either asset, then the exchange is measured at the carrying value of the asset the entity no longer owns. For example, if the new asset's fair value is higher than the carrying amount of the old asset, a gain may be recognised.

This requirement is qualified by a 'commercial substance' test (see 3.3.4.A below). If it is not possible to demonstrate that the transaction has commercial substance, assets received in exchange transactions will be recorded at the carrying value of the asset given up. [FRS 102.17.14]. Accordingly, there is no gain on such a transaction.

If the transaction passes the 'commercial substance' test, then the exchanged asset is to be recorded at its fair value as shown in Illustration 3-5 below:

Illustration 3-5: Exchange of assets

An entity has land and office buildings with an aggregate carrying value of £600,000 and a fair value of £750,000. It exchanges the land and buildings for land and buildings (a manufacturing facility) in another location with a fair value of £1 million and makes an additional cash payment of £250,000. The transaction has commercial substance.

The entity must recognise the land and buildings received at a cost of £1 million (its fair value) and must recognise a profit on disposal of the land and buildings of £150,000, calculated as shown below:

Fair value of asset received	1,000,000
Less:	
Carrying value of asset given up	(600,000)
Cash paid	(250,000)
Gain on disposal	150,000

As discussed in 3.7 below, Section 17 requires gains or losses on items that have been derecognised to be included in profit or loss in the period of derecognition but does not allow gains on derecognition to be classified as revenue (except for certain assets previously held for rental - see 3.7.1 below). [FRS 102.17.28]. However, where a gain arises on the exchange of one item of PP&E for another, under current UK law, this gain is likely to be an unrealised profit if the asset received is still held by the entity at the balance sheet date. It must therefore be included in other comprehensive income (OCI) since only profits realised at the balance sheet date are to be included in the profit and loss account. [1 Sch 13(a)]. For further guidance on the distributable reserves implications of asset swaps, see the ICAEW's guidance on realised and distributable profits under the Companies Act 2006, TECH 02/17BL, paragraphs 10.44-10.51. For consolidated financial statements, the gain is also recognised in OCI if the new asset acquired is an interest in another entity (see Chapter 8). [FRS 102.9.31(c)].

3.3.4.A Commercial substance

Section 17 does not provide further guidance on 'commercial substance' and therefore the application of this term will involve judgement and careful consideration of facts and circumstances. In addition, an entity may also consider the guidance provided under IFRS - the commercial substance test was put in place as an anti-abuse provision to prevent gains in income being recognised when the transaction had no discernible effect on the entity's economics. [IAS 16.BC21]. Under IAS 16 the commercial substance of an exchange is to be determined by forecasting and comparing the future cash flows budgeted to be generated by the incoming and outgoing assets. For there to be commercial substance, there must be a significant difference between the two forecasts. IAS 16 sets out this requirement as follows:

"An entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows are expected to change as a result of the transaction. An exchange transaction has commercial substance if:

- (a) the configuration (risk, timing and amount) of the cash flows of the asset received differs from the configuration of the cash flows of the asset transferred; or
- (b) the entity-specific value of the portion of the entity's operations affected by the transaction changes as a result of the exchange; and
- (c) the difference in (a) or (b) is significant relative to the fair value of the assets exchanged." [IAS 16.25].

As set out in the definitions of IAS 16, entity-specific value is the net present value of the future predicted cash flows from continuing use and disposal of the asset. Post-tax cash flows must be used for this calculation. IAS 16 contains no guidance on the discount rate to be used for this exercise, nor on any of the other parameters involved, but it does suggest that the result of these analyses might be clear without having to perform detailed calculations. [IAS 16.25].

Particular care will have to be taken to ensure that the transaction has commercial substance if an entity receives a similar item of PP&E in exchange for a similar asset of its own. Commercial substance may be difficult to demonstrate if the entity is exchanging an asset for a similar one in a similar location. In many cases, the risk, timing and amount of cash flows associated with similar assets in similar locations would not be significantly different. Similarly, it would be unusual if the entity-specific values of similar assets differed enough in any arm's length exchange transaction to meet condition (c). However, the risk, timing and amount of cash flows could differ if one asset was available for sale and the entity intended to sell it whereas the previous asset could not be realised by sale or only sold over a much longer timescale. It is feasible that such a transaction could meet the conditions (a) and (c) above.

Other types of exchange are more likely to pass the 'commercial substance' test, for example exchanging an interest in an investment property for one that the entity uses for its own purposes. The entity has exchanged a rental stream and instead has an asset that contributes to the cash flows of the cash-generating unit of which it is a part. In this case it is probable that the risk, timing and amount of the cash flows of the asset received would differ from the configuration of the cash flows of the asset transferred.

3.3.4.B Reliably measurable

In the context of asset exchanges, Section 17 does not contain guidance on the reliable determination of fair values. However, once again, entities may consider guidance provided under IFRS which states:

"The fair value of an asset is reliably measurable if (a) the variability in the range of reasonable fair value measurements is not significant for that asset or (b) the probabilities of the various estimates within the range can be reasonably assessed and used when measuring fair value." [IAS 16.26].

This is similar to requirements set out in Section 2A *Fair Value Measurement*:

Extract from Section 2A

- 2A.21** A fair value selected from within a range of reasonable valuations is a reliable measure of the fair value if:
- (a) the range of reasonable fair value measures is not significant; or
 - (b) the probabilities of the various measures within the range can be reasonably assessed and used to select the most appropriate fair value.

The 'reliable measurement' test for using fair value serves to minimise the risk that entities could 'manufacture' gains by attributing inflated values to the assets exchanged.

If the fair value of neither the asset given up nor the asset received can be measured reliably (i.e., neither (a) nor (b) above are met), the cost of the asset is measured at the carrying amount of the asset given up; this means there is no gain on the transaction. [FRS 102.17.14].

3.3.5 Assets held under leases

Section 20 requires lessees to initially measure the right-of-use asset at cost, which comprises the amount of the initial measurement of the lease liability, any lease payments made at or before the commencement date, lease incentives received, initial direct costs and an estimate of restoration, removal and dismantling costs. The requirements of Section 20 are discussed in detail in Chapter 23.

3.4 Subsequent measurement: accounting policy choice

Section 17 allows one of two alternatives to be chosen as the accounting policy for measurement of PP&E after initial recognition. The choice made must be applied to an entire class of PP&E, which means that not all classes are required to have the same policy. [FRS 102.17.15].

The first alternative is the cost model whereby the item is carried at cost less any accumulated depreciation and less any accumulated impairment losses. [FRS 102.17.15A]. The other alternative is the revaluation model, whereby PP&E is initially recognised at cost and subsequently measured at fair value less subsequent accumulated depreciation and impairment losses. [FRS 102.17.15B].

Whichever model is used after initial recognition, the provisions discussed in 3.5 below are applicable.

3.5 Subsequent measurement: depreciation

Section 17 requires the depreciable amount of an asset to be allocated on a systematic basis over its useful life. [FRS 102.17.18]. This systematic allocation of the depreciable amount of an asset over its life is referred to as 'depreciation'. [FRS 102 Appendix I]. The key concepts of 'depreciable amount' and 'useful life' are discussed at 3.5.2 and 3.5.3 respectively.

Depreciation must be charged on all items of PP&E. This requirement applies even to PP&E measured under the revaluation model. This is the case even if the fair value of the asset at the year-end is higher than the carrying amount, as long as the residual value of the item is lower than the carrying amount. If the residual value exceeds the carrying amount, no depreciation is charged until the residual value once again decreases to less than the carrying amount. Repair and maintenance of an asset does not negate the need to depreciate it.

The depreciation charge for each period is recognised in profit or loss unless it forms part of the cost of another asset. For example, the depreciation of manufacturing PP&E is included in the costs of inventories (see Chapter 16). [FRS 102.17.17]. Similarly, depreciation of PP&E used for development activities may be included in the cost of an intangible asset recognised in accordance with Section 18 (see Chapter 21 at 3.2.3.C).

3.5.1 Depreciation by component of an item of PP&E

Section 17 links its recognition concept of a component of an asset, discussed at 3.2.2 above, with the analysis of assets for the purpose of depreciation. Each major component of an item of PP&E with significantly different patterns of consumption of economic benefits must be depreciated separately over its useful life, which means that the initial cost must be allocated between the major components by the entity. Other assets are depreciated over their useful lives as a single asset. [FRS 102.17.16]. Components are identified by their patterns of consumption of economic benefits, and they may have the same useful lives and depreciation method. Practically, they could be grouped for the purposes of calculating depreciation charge.

Section 17 does not provide guidance for depreciating the remainder of an asset that has not separately been identified into components. These may consist of other components that are individually not significant. An entity may consider the approach in IAS 16 and thus, the entity may use estimation techniques to calculate an appropriate depreciation method for all of these parts. [IAS 16.46]. An entity may also depreciate separately components that are not significant in relation to the whole.

3.5.2 Depreciable amount and residual values

The depreciable amount of an item of PP&E is its cost or valuation less its estimated residual value. The residual value of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life. [FRS 102 Appendix I].

Factors such as a change in how an asset is used, significant unexpected wear and tear, technological advancement, and changes in market prices may indicate that the residual value or useful life of an asset has changed since the most recent annual reporting date. Entities must assess if such indicators exist. If such indicators are present, an entity must review its previous estimates and, if current expectations differ, amend the residual value, depreciation method or useful life. The entity must account for the change in residual value, depreciation method or useful life as a change in an accounting estimate in accordance with paragraphs 14D to 18 of Section 10 (see Chapter 9). [FRS 102.17.19]. This requirement applies to all items of PP&E and therefore is applicable to all components of them.

The residual value of an item of PP&E today is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and condition it will be in at the end of its useful life. Therefore, Section 17 contains an element of continuous updating of residual values because it is the current disposal amount (e.g., value at financial reporting date) of an asset's future state (i.e., asset's condition in the future when the entity expects to dispose of it). This means that price changes (e.g., due to inflation) would only be taken into account up to the reporting date and that future changes in residual value other than the effects of expected wear and tear are not taken into account.

Climate change has the potential to affect the residual value of PP&E and such considerations should, form a part of an entity's continuous assessment of residual values. For example, while residual values of PP&E assets are generally fairly predictable, this is not necessarily the case if there are relatively few buyers of second-hand PP&E assets that use technologies that are being phased out before a legal deadline.

As any change in the residual value directly affects the depreciable amount, it may also affect the depreciation charge. This is because the depreciable amount (i.e., the amount actually charged to profit or loss over the life of the asset) is calculated by deducting the residual value from the cost (or other amount substituted for cost, such as valuation) of the asset. In periods of rising prices, the residual value for assets may appreciate in value. If it does, the residual value is capped at the asset's carrying amount. Where residual value rises over time the depreciation charge on an asset is likely to decline and may cease altogether when the residual value exceeds the asset's carrying value.

Many items of PP&E have a negligible residual value. This is usually because they are kept for substantially all of their economic lives, such that the useful life as assessed under Section 17 is consistent with the assets' total economic life. Residual values are of no relevance if the entity intends to keep the asset until it is of no use to anyone else. If an entity uses residual values based on prices obtained in the market for a type of asset that it holds, it must also demonstrate an intention to dispose of that asset before the end of its economic life.

The requirement concerning the residual values of assets highlights how important it is that residual values are considered and reviewed in conjunction with the review of useful lives. The useful life is the period over which the entity expects to use the asset, not the asset's economic life.

As discussed above, the residual value of an item of PP&E is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal. Section 17 does not define 'costs of disposal'. The term also is not defined under IAS 16. For many entities the estimated cost of disposal will be immaterial, but an entity that incurs more significant costs associated with disposing PP&E will need to apply judgement in determining the appropriate costs to include. Entities may apply the hierarchy in Section 10 to develop an appropriate policy in this area. This may be particularly relevant to certain types of entity, such as leasing companies that incur significant selling costs in routinely disposing of assets previously held for rental.

3.5.3 Useful lives

One of the critical assumptions on which the depreciation charge depends is the useful life of the asset. Useful life is defined as either:

- The period over which an asset is expected to be available for use by an entity.
 - Or
 - The number of production or similar units expected to be obtained from the asset by an entity.
- [FRS 102 Appendix I].

As discussed at 3.5.2 above, the asset's useful life must be estimated on a realistic basis and reviewed at the end of each reporting period for indicators that would suggest it has changed. The effects of changes in useful life are recognised prospectively, over the remaining useful life of the asset. [FRS 102.17.19].

The useful life is the period over which the present owner will benefit and not the total potential life of the asset; the two will often not be the same.

It is quite possible for an asset's useful life to be shorter than its economic life. The estimation of the useful life of the asset is a matter of judgement based on the experience of the entity with similar assets. Many entities have an asset management policy of disposing of assets when they still have a residual value, which means that another user can benefit from the asset. This is particularly common with property and motor vehicles, where there are effective second-hand markets, but less usual for plant and machinery. For example, an entity may have a policy of replacing all its motor vehicles after three years, so this will be their estimated useful life for depreciation purposes. The entity will depreciate them over this period down to the estimated residual value. The residual values of motor vehicles are often easy to obtain and the entity will be able to reassess these residuals in line with the requirements of the standard.

Judgement is necessary in determining the useful life of an asset. The future economic benefits embodied in an asset are consumed principally through usage. However, other factors must be taken into account, such as technical or commercial obsolescence and wear and tear while an asset remains idle, because they often result in the diminution of the economic benefits expected to be obtained from the asset by the entity. Consequently, Section 17 provides the following guidance about the factors to be considered when determining the useful life of an asset:

- (a) The expected usage of the asset. Usage is assessed by reference to the asset's expected capacity or physical output.
- (b) Expected physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance programme, and the care and maintenance of the asset while idle (see 3.5.3.A below).
- (c) Technical or commercial obsolescence arising from changes or improvements in production, or from a change in the market demand for the product or service output of the asset (see 3.5.3.C below).
- (d) Legal or similar limits on the use of the asset, such as the expiry dates of related leases. [FRS 102.17.21].

3.5.3.A Repairs and maintenance

The initial assessment of the useful life of the asset will take into account the expected routine spending on repairs and expenditure necessary for it to achieve that life. [FRS 102.17.21(b)]. Although Section 17 implies that this refers to an item of plant and machinery, care and maintenance programmes are relevant to assessing the useful lives of many other types of asset. For example, an entity may assess the useful life of a railway engine at thirty-five years on the assumption that it has a major overhaul every seven years. Without this expenditure, the life of the engine would be much less certain and could be much shorter. Maintenance necessary to support the fabric of a building and its service potential is also taken into account in assessing its useful life. Eventually, it will always become uneconomic for the entity to continue to maintain the asset so, while the expenditure may lengthen the useful life, it is unlikely to make it indefinite. Note that this applies whether the expenditure is capitalised because it is regarded as a 'major inspection' accounted for in accordance with the requirements in paragraph 7 of Section 17 (see 3.2.3.B above) or if it is repairs and maintenance that is expensed as incurred.

3.5.3.B Land

As discussed in 3.2.2.B above, land and buildings are separable assets and must be accounted for separately, even when they are acquired together. [FRS 102.17.8]. Land, which generally has an unlimited life, is not usually depreciated. [FRS 102.17.16]. A building is a depreciable asset and its useful life is not affected by an increase in the value of the land on which it stands.

Although land generally has an unlimited useful life, there may be circumstances in which depreciation could be applied to land. In those instances, in which land has a finite life (e.g., land that is used either for extractive purposes such as a quarry or mine, or for some purpose such as landfill), it will be depreciated in an appropriate manner that reflects the benefits to be derived from it by the entity. Further, the cost of such land may include an element for site dismantlement or restoration, e.g., the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, and any subsequent changes thereto (see 3.3.3 above). Any such element will have to be separated from the land element and depreciated over an appropriate period (i.e., the period of benefits obtained by incurring these costs), which will often be the estimated useful life of the site for its purpose and function. An entity engaged in landfill on a new site may make a provision for restoring it as soon as it starts preparation by removing the overburden. It will separate the land from the 'restoration asset' and depreciate the restoration asset over the landfill site's estimated useful life. If the land has an infinite useful life, an appropriate depreciation basis must be chosen that reflects the period of benefits obtained from the restoration asset.

While FRS 102 provides no specific guidance related to revision of estimated dismantling costs, an entity may consider the approach applied by IFRIC 1 (see 3.3.3 above and Chapter 24 at 3.11.1). Accordingly, if the estimated costs are revised, in accordance with IFRIC 1, the adjusted depreciable amount of the asset is depreciated over its useful life. Therefore, once the related asset has reached the end of its useful life, all subsequent changes in the liability will be recognised in profit or loss as they occur, irrespective of whether the entity applies the cost or revaluation model. [IFRIC 1.7].

3.5.3.C Technological change

A current or expected future reduction in the market demand for the product or service output of an asset may be evidence of technical or commercial obsolescence. Expected future reductions in the selling price of an item that was produced using an asset could also indicate the expectation of technical or commercial obsolescence of the asset, which, in turn, might reflect a reduction of the future economic benefits embodied in the asset. If an entity anticipates technical or commercial obsolescence, it must reassess the residual value of an asset, its useful life or the pattern of consumption of future economic benefits.

[FRS 102.17.19]. In such cases, it might be more appropriate to use a diminishing balance method of depreciation to reflect the pattern of consumption (see 3.5.5.B below).

The effects of technological change are often underestimated. It affects many assets, not only high technology plant and equipment such as computer systems. For example, many offices that have been purpose-built can become obsolete long before their fabric has physically deteriorated, for reasons such as the difficulty of introducing computer network infrastructures or air conditioning, poor environmental performance or an inability to meet new legislative requirements such as access for people with disabilities. Another example might be climate-related factors driving technological change. Therefore, the estimation of an asset's useful life is a matter of judgement and the possibility of technological change must be taken into account.

3.5.3.D Depreciation period of leasehold improvements

As explained at 3.5.3 above, Section 17 sets out factors an entity must consider in determining the useful life of an asset. Factor (d) states that the 'expiry dates of related leases' is considered when determining the asset's useful life. [FRS 102.17.21]. Generally, the useful life of the leasehold improvement is the same or less than the lease term, as defined by Section 20 (see Chapter 23).

The interaction between the useful life of leasehold improvements and the term of the associated lease is not further addressed in FRS 102, but was discussed by the IFRS Interpretations Committee ('IFRS IC') in November 2019¹⁰¹. Similar principles to those discussed by the IFRS IC are expected to apply to FRS 102 reporters as paragraph 21 of Section 17 sets out similar factors to those referred to in paragraph 56 of IAS 16 and the term 'useful life' is defined in the same way in FRS 102 as it is in IAS 16.

In applying the definition of 'useful life', the useful life is based on the utility of an asset to the entity, and therefore, an asset's useful life under Section 17 may be shorter than its economic life. If the lease term of the related lease is shorter than the economic life of the associated leasehold improvements, in order to determine the useful life of the leasehold improvements, the entity needs to consider whether it expects to use the leasehold improvements beyond that lease term - that is, whether the leasehold improvements will continue to have utility to the entity beyond the end of the lease term. This may be because the leasehold improvements are removable and will have an alternative use by the entity after the lease is terminated or because the entity expects (but is not reasonably certain to) extend the lease beyond the lease term. If the leasehold improvements are not expected to be used beyond the lease term, then applying the definition of useful life in FRS 102 we would expect an entity to conclude that the useful life of the leasehold improvements is the same as the lease term.

However, if the leasehold improvements are expected to be used beyond the lease term, we believe two approaches to determine the useful life of the leasehold improvements are acceptable.

How we see it

The relevant requirements in respect of useful life and its interaction with lease term may be subject to two different interpretations. Hence, when leasehold improvements are expected to be used beyond the lease term, it is acceptable to depreciate the leasehold improvements either over (i) the shorter lease term or (ii) their expected useful life.

The two approaches are shown in Illustration 3-6 below. The entity must adopt one of the approaches to determine the useful life of the leasehold improvement. This approach must be applied consistently to similar leasehold improvements with similar fact patterns.

101 [IFRIC Update](#), November 2019, available on the IFRS Foundation's website.

Illustration 3-6: Depreciation period of leasehold improvements

A lessee enters into a lease for an office property. The lease has a non-cancellable term of 5 years and contains an option for the lessee to extend the lease for a further 5 years. The rentals for the period under the extension option (i.e., years 6-10) are at market rates.

Upon commencement of the lease term, the lessee incurs £100,000 constructing immoveable leasehold improvements specific to the property. The useful life of the leasehold improvement is 7 years. At the commencement date of the lease, the lessee expects, but is not reasonably certain, to exercise the extension option. At the commencement date of the lease, the lessee appropriately considered the potential economic penalty associated with abandoning the leasehold improvements when determining the lease term is 5 years.

In our fact pattern, the lessee's investment in the leasehold improvement does not create a significant economic penalty that would affect the lease term for accounting purposes. That is, the economic penalty of abandoning the leasehold improvement at the end of the non-cancellable term of the lease is not so significant as to make exercise of the renewal option reasonably certain.

The relevant requirements may be subject to two different interpretations:

Approach (1):

The lessee may depreciate the leasehold improvements over a period that is the shorter of the lease term or the assets' useful life (i.e., the lessee depreciates the leasehold improvement over the lease term of 5 years in the fact pattern).

This approach is based on the following interpretation: In this fact pattern, at the commencement date of the lease, the lessee appropriately considered all relevant facts and circumstances (including the economic penalty associated with abandoning the leasehold improvements) and concluded it expects but is not reasonably certain to exercise the option to extend the lease. Therefore, for the purpose of Section 20 of FRS 102, the lease term is 5 years. [FRS 102 Appendix I]. One of the factors in determining the useful life of the leasehold improvement is the expiry date of the related lease. [FRS 102 Appendix I, FRS 102.17.21(d)]. The expected utility of the leasehold improvement must be consistent with the lease term as determined in accordance with Section 20. Therefore, the useful life of the leasehold improvements is 5 years.

Approach (2):

The lessee may depreciate the leasehold improvements over the expected useful life of the leasehold improvement (i.e., the lessee depreciates the leasehold improvement over 7 years in the fact pattern).

While paragraph 21(d) of Section 17 must be considered when determining the asset's useful life, the factor regarding "expected usage of the asset ..." in paragraph 21(a) of Section 17 is equally relevant. The condition contained in paragraph 21(d) reflects the necessity to consider the existence of legal or other externally imposed limitations on an asset's useful life. However, in the fact pattern, the ability to extend the lease term is within the control of the lessee and is at market rates so there are no significant costs or impediments to renewal.

In this fact pattern, after considering the potential economic penalty associated with the loss of the leasehold improvements, the lease term as determined in accordance with Section 20 does not include the extension period because, at the commencement date of the lease, the lessee determined it is not reasonably certain it will exercise the renewal option. However, a different threshold (i.e., the expected usage of the asset) is used for the determination of the useful life of an asset in the scope of Section 20 (i.e., the leasehold improvement).

The term 'expected usage of the asset' for the determination of useful life of an asset indicates a lower threshold than the 'reasonably certain' threshold for including the extension period in the lease term for accounting purposes. As a result, although the accounting lease term is 5 years, the leasehold improvement is depreciated over the period over which the lessee expects to use the asset (as it expects to extend the lease to 10 years), which is 7 years.

The determination of the useful life and lease term may require significant judgement. Hence, it is important to ensure that all facts and circumstances are taken into account when determining the useful life of the leasehold improvement and the lease term based on the relevant guidance under Section 17 and Section 20 respectively and each conclusion needs to be supported with appropriate evidence.

For instance, if approach (2) is adopted in Illustration 3-6 above, the entity would have to carefully evaluate the reason to construct leasehold improvements with significant expected economic value at the end of 5 years, and yet conclude that the economic penalty associated with abandoning such assets at the end of year 5 is not so significant that it renders the renewal option reasonably certain of exercise.

In an example where the leasehold improvements are non-removable, the useful life of the leasehold improvement generally would not exceed the total of the non-cancellable period and the period covered by renewal option(s) (i.e., 10 years in the fact pattern).

3.5.3.E The effects of climate change

Climate change, including associated legislation, may affect how and for how long items of PP&E are used. Entities will need to consider climate-related factors when determining the expected useful life of their assets. An entity would need to assess whether it expects, for example, the early closure of fossil-fuel producing assets (e.g., coal producing assets) or continued use of carbon-emitting assets (e.g., high emission ships). Similarly, an entity would need to consider if its PP&E assets could be indirectly affected if, for example, it is used to provide services to customers in high emission industries.

3.5.4 When depreciation starts and ceases

Section 17 is clear on when depreciation must start and finish, and sets out the requirements as follows:

- Depreciation of an item of PP&E begins when it is available for use, which is defined as occurring when the asset is in the location and condition necessary for it to be capable of operating in the manner intended by management. This is the point at which capitalisation of costs relating to the asset ceases. In contrast, depreciation of a right-of-use asset begins from the commencement date of the lease. [FRS 102.20.58].
- Depreciation of an asset ceases when the asset is derecognised. [FRS 102.17.20].

Therefore, an entity does not stop depreciating an asset merely because it has become idle or has been retired from active use, unless the asset is fully depreciated. However, if the entity is using a usage method of depreciation (e.g., the units of production method) the depreciation charge can be zero while there is no production. [FRS 102.17.20]. Of course, a prolonged period in which there is no production may raise questions as to whether the asset is impaired: an asset becoming idle is a specific example of an indication of impairment in Section 27 (see Chapter 29). [FRS 102.17.26, FRS 102.27.9(f)].

3.5.5 Depreciation methods

There are a variety of depreciation methods that can be used to allocate the depreciable amount of an asset on a systematic basis over its useful life, and Section 17 does not prescribe a particular method. It simply states that “an entity must select the depreciation method that reflects the pattern in which it expects to consume the asset’s future economic benefits”, mentioning straight-line, diminishing balance and units of production methods as possibilities. [FRS 102.17.22]. The overriding requirement is that the depreciation charge reflects the pattern of consumption of the benefits the asset brings over its useful life, and is applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits. [FRS 102.17.22, FRS 102.17.23].

The essence of choosing a fair depreciation method is to reflect the consumption of economic benefits provided by the asset concerned. In most cases the straight-line basis will give perfectly acceptable results, and the majority of entities use this method. There are instances, such as the extraction of a known proportion of a mineral resource, or the use of a certain amount of the total available number of working hours of a machine, where it may be that a unit of production method will give fairer results. When assessing the appropriateness of any method, entities must consider how the economic benefits of a particular asset are consumed, for example, through wear and tear, output produced or other factors such as technological obsolescence.

Section 17 contains an explicit requirement that the depreciation method be reviewed if there is an indication that there has been a significant change since the last annual reporting date in the pattern by which an entity expects to consume an asset’s future economic benefits. [FRS 102.17.23]. This could mean, for example, concluding that the straight-line method was no longer appropriate and changing to a diminishing balance method. If there has been such a change, the depreciation method must be changed to reflect it. Under paragraphs 14D to 18 of Section 10 (see Chapter 9), this change is a change in accounting estimate and not a change in accounting policy. [FRS 102.17.23]. This means that the consequent depreciation adjustment must be made prospectively, i.e., the asset’s depreciable amount must be written off over current and future periods. [FRS 102.10.16].

Some industries use revenue as a practical basis to depreciate PP&E. These industries argue that there is a linear relationship between revenue and the units of production method (discussed below at 3.5.5.C). Unlike IFRS, FRS 102 does not explicitly prohibit the use of revenue as the basis to depreciate assets. However, it is important to remain mindful that the depreciation method selected must reflect the pattern

in which the entity expects to consume the asset's future economic benefits. Revenue reflects the output of the asset, but may also reflect other factors that do not affect depreciation, such as changes in sales volumes and selling prices, the effects of selling activities and other inputs and processes. Therefore, a revenue-based method of depreciation may not faithfully reflect how the asset is used or consumed.

3.5.5.A Straight-line method

The straight-line method of depreciation is well-known and understood. Its simplicity makes it the most commonly-used method in practice. The method is time-based and involves the use of a fixed percentage of the original cost of the asset in spreading the depreciable amount evenly over the useful life of the asset resulting in a constant depreciation charge over such period. It is considered the most appropriate method to use when the pattern of consumption of future economic benefits of an asset is expected to be constant year-on-year or when such pattern cannot be readily determined. Depreciation on a straight-line basis is explained in Illustration 3-7:

Illustration 3-7: Straight-line depreciation

An asset costs CU12,000 and has a useful life of five years and a residual value of CU1,000. The depreciable amount is CU11,000 (CU12,000 - CU1,000). The annual depreciation charge under the straight-line method is calculated at 2,200 (CU11,000/5).

		CU
Year 1	Cost	12,000
	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	9,800
Year 2	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	7,600
Year 3	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	5,400
Year 4	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	3,200
Year 5	Depreciation at 1/5 of 11,000	(2,200)
	Net book value	1,000

3.5.5.B Diminishing balance method

The diminishing balance method involves determining a percentage depreciation that will write off the asset's depreciable amount over its useful life. This involves calculating a rate that will reduce the asset's carrying amount to its residual value at the end of the useful life. One approach to applying the diminishing balance method is shown in Illustration 3-8:

Illustration 3-8: Diminishing balance depreciation

An asset costs £6,000 and has a life of four years and a residual value of £1,500. It calculates that the appropriate depreciation rate on the declining balance is 29% and that the depreciation charge in years 1-4 will be as follows:

		£
Year 1	Cost	6,000
	Depreciation at 29.3% of £6,000	1,757
	Carrying amount	4,243
Year 2	Depreciation at 29.3% of £4,243	1,243
	Carrying amount	3,000
Year 3	Depreciation at 29.3% of £3,000	879
	Carrying amount	2,121
Year 4	Depreciation at 29.3% of £2,121	621
	Carrying amount	1,500

The sum of digits method is another form of the diminishing balance method, and is a method that can easily be applied if the asset has a residual value. If an asset has an estimated useful life of four years then the digits 1, 2, 3, and 4 are added together, giving a total of 10. Depreciation of four-tenths, three-tenths and so on, of the cost of the asset, less any residual value, will be charged in the respective years. The method is sometimes called the 'rule of 78', 78 being the sum of the digits 1 to 12. Illustration 3-9 demonstrate the application of the sum of digits method:

Illustration 3-9: Sum of the digits depreciation

An asset costs £10,000 and is expected to be sold for £2,000 after four years. The depreciable amount is £8,000 (£10,000 - £2,000). Depreciation is to be provided over four years using the sum of the digits method.

		£
Year 1	Cost	10,000
	Depreciation at 4/10 of £8,000	3,200
	Carrying amount	6,800
Year 2	Depreciation at 3/10 of £8,000	2,400
	Carrying amount	4,400
Year 3	Depreciation at 2/10 of £8,000	1,600
	Carrying amount	2,800
Year 4	Depreciation at 1/10 of £8,000	800
	Carrying amount	2,000

3.5.5.C Units of production method

Under this method, the asset is written off in line with its estimated total output. By relating depreciation to the proportion of productive capacity utilised to date, it reflects the fact that the useful economic life of certain assets, principally machinery, is more closely linked to its usage and output than to time. This method is often used in extractive industries, for example, to amortise the costs of development of productive oil and gas facilities.

3.5.6 Impairment

All items of PP&E accounted for under Section 17 are subject to the impairment requirements of Section 27. That section explains when and how an entity reviews the carrying amount of its assets, how it determines the recoverable amount of an asset, and when it recognises or reverses an impairment loss. [FRS 102.17.24]. Impairment is discussed in Chapter 29.

FRS 102 does not require items of PP&E that have indefinite lives to be subject to automatic annual impairment testing.

3.5.6.A Compensation for impairment

The question has arisen about the treatment of any compensation an entity may be due to receive as a result of an asset being impaired. For example, an asset that is insured might be destroyed in a fire, so repayment from an insurance company might be expected. These events - the impairment or losses of items of PP&E, the related claims for or payments of compensation from third parties and any subsequent purchase or construction of replacement assets - are separate economic events and must be accounted for separately as follows:

- Impairments of PP&E are recognised in accordance with Section 27 (see Chapter 29).
 - Derecognition of items retired or disposed of must be recognised in accordance with Section 17 (derecognition is discussed at 3.7 below).
- And
- Compensation from third parties for PP&E that is impaired, lost or given up is included in profit and loss only when the compensation is virtually certain. [FRS 102.17.25].

The cost of items of PP&E restored, purchased or constructed as replacements is determined in accordance with Section 17 (see sections 3.2 and 3.3 above)

3.5.6.B PP&E held for sale

An entity's plan to dispose of an asset before the previously expected date is an indicator of impairment that triggers the calculation of the asset's recoverable amount for the purpose of determining whether the asset is impaired. [FRS 102.17.26, FRS 102.27.9(f)]. If the asset is impaired, then the carrying amount of the asset must be written down to its recoverable amount.

Although the entity plans to dispose of the asset, depreciation must continue until the asset is disposed. In addition, the plan to dispose an asset might indicate that the residual value or the remaining life of the asset needs adjustment even if there is no impairment.

PP&E held for sale is an area of difference between FRS 102 and IFRS, as discussed at 2.1 above.

3.6 Measurement after initial recognition: revaluation model

As discussed at section 3.4 above, after initial recognition, an accounting policy choice exists which is available to all entities (by class of asset) to measure PP&E using either the cost model or the revaluation model at the end of subsequent reporting periods. If the revaluation model is adopted, PP&E is initially recognised at cost and subsequently measured at a revalued amount, being its fair value (if it can be measured reliably) at the date of the revaluation, less subsequent accumulated depreciation and impairment losses. [FRS 102.17.15B]. Fair value is determined in accordance with the requirements of Section 2A and is usually the market value of the items of PP&E. [FRS 102.17.15C]. The meaning of fair value is discussed further at section 3.6.1 below.

The use of the revaluation model can result in deferred taxation complexities. Examples in this chapter ignore the effects of deferred tax. See Chapter 31 at 7.2 for guidance on recognition of deferred tax in respect of assets carried at fair value or revalued amount.

In practice, 'fair value' will usually be the market value of the asset. There is no requirement for a professional external valuation or even for a professionally qualified valuer to perform the appraisal, although in practice professional advice is often sought.

Section 17 does not prescribe the frequency of revaluations and simply states that revaluations are to be made with sufficient regularity to ensure that the carrying amount does not differ materially from the fair value at the end of the reporting period. [FRS 102.17.15B]. When the fair value of a revalued asset differs materially from its carrying amount, a further revaluation is necessary. As some items of PP&E have frequent and volatile changes in fair value, these would need to be revalued more frequently (e.g., annually).

If the revaluation model is adopted, all items within a class of assets are to be revalued simultaneously. This prevents selective revaluations particularly choosing to revalue only those assets that have significantly increased in value. A class of PP&E is a grouping of assets of a similar nature, function or use in an entity's business. [FRS 102.17.15]. This is not a precise definition. The following could be examples of separate classes of asset:

- Land
- Land and buildings
- Machinery
- Ship
- Aircraft
- Motor vehicles
- Furniture and fixtures
- And
- Office equipment

These are very broad categories of asset and it is possible for them to be classified further into groupings of assets of a similar nature and use. For example, office buildings and factories or hotels and fitness centres, could be separate classes of asset.

If the entity used the same type of asset in two different geographical locations, e.g., clothing manufacturing facilities for similar products or products with similar markets, say in the United Kingdom and the Republic of Ireland, it is likely that these would be seen as part of the same class of asset. However, if the entity manufactured pharmaceuticals and clothing, both in European facilities, then few would argue that these could be assets with a sufficiently different nature and use to be a separate class. Ultimately, it must be a matter of judgement in the context of the specific operations of individual entities.

How we see it

In our view, a rolling valuation of a class of assets could be made provided that the class is revalued over a short period of time and the valuations are kept up to date. This approach is explicitly permitted under IAS 16. [IAS 16.38]. In practice, a rolling valuation is usually performed if the value of the assets changes very insignificantly (in which case the valuations may only be performed less frequently) because if a significant change is revealed then a new revaluation for the entire class is required to keep the valuation up to date.

3.6.1 The meaning of fair value

Fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of FRS 102, the guidance in Section 2A must be used in determining fair value (see Chapter 10). [FRS 102 Appendix I]. Section 2A does not prescribe when to measure fair value but provides guidance on how to measure it when fair value is required or permitted by FRS 102.

Section 17 describes the process of determining fair value for assets within its scope. For land and buildings, fair value is usually determined from market-based evidence by appraisal that is normally undertaken by professionally qualified valuers (although income or depreciated replacement cost approaches are permitted if no such evidence is available because of the specialised nature of the item of PP&E - see 3.6.2 below). For other items of PP&E, the fair value is usually their market value determined by appraisal. [FRS 102.17.15C, FRS 102.17.15D]. Section 17 does not imply that fair value and market value are synonymous, although it states that the fair value of items of PP&E is usually their market value determined by appraisal. [FRS 102.17.15C].

Section 2A specifies that “fair value is a market-based measurement, not an entity-specific measurement ...”. [FRS 102.2A.3]. The following sections consider some of the key considerations when measuring the fair value of an item of PP&E under Section 2A, including the concept of highest and best use and the focus of the methodology on the inputs used in valuation techniques.

3.6.1.A Highest and best use

Extract from Section 2A

2A.9 A fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use.

This evaluation will include uses that are “physically possible, legally permissible and financially feasible”. [FRS 102.2A.10].

The highest and best use is determined from the perspective of market participants that would be acquiring the asset, but the starting point is the asset's current use. It is presumed that an entity's current use of the asset is the asset's highest and best use, unless market or other factors suggest that a different use of the asset by market participants would maximise its value. [FRS 102.2A.11].

As discussed above, Section 17 itself does not imply that fair value and market value are synonymous, and prior to the introduction of Section 2A (which was introduced as part of the 2024 Periodic Review amendments), FRS 102 may have allowed a broader meaning of the term ‘fair value’. The term could have been interpreted as encompassing the following two commonly used, market derived, valuation bases:

- Market value in existing use, an entry value for property in continuing use in the business which is based on the concept of net current replacement cost.
- Or
- Open market value, which is an exit value and based on the amount that a property that is surplus to requirements could reach when sold.

Both of these bases are market-derived, yet they can differ for a variety of reasons. A property may have a higher value on the open market if it could be redeployed to a more valuable use. On the other hand, the present owner may enjoy some benefits that could not be passed on in a sale, such as planning consents that are personal to the present occupier. Market value in existing use will be presumed to be fair value under Section 2A for many types of business property unless market or other factors suggest that open market value is higher (i.e., open market value represents highest and best use). For most retail sites market value in existing use will be fair value. However, if there is market evidence that certain types of

property have an alternative use with a higher value, e.g., pubs or warehouses that can be converted to residential use, this will have to be taken into account. In summary, the introduction of Section 2A makes clear that fair value is an exit price, and for non-financial assets such as PP&E, must take into account a market participant's ability to generate economic benefits by using the asset in its highest and best use.

The fair value of an item of PP&E will either be measured based on the value it would derive on a stand-alone basis or, if the highest and best use of the item is or would be achieved through its use in combination with other assets (and liabilities) as a group, the fair value measurement of the item of PP&E must reflect that use, by assuming that a market participant already holds the complementary assets and the associated liabilities. [FRS 102.2A.12].

The following Illustration is derived from IFRS 13, upon which Section 2A is based, and shows highest and best use in establishing fair value. [IFRS 13.IE7, IFRS 13.IE8].

Illustration 3-10: Highest and best use

An entity acquires land in a business combination. The land is currently developed for industrial use as a site for a factory. The current use of land is presumed to be its highest and best use unless market or other factors suggest evidence for a different use.

Scenario (1):

In the particular jurisdiction, it can be difficult to obtain consents to change use from industrial to residential use for the land and there is no evidence that the area is becoming desirable for residential development. The fair value is based on the current industrial use of the land.

Scenario (2):

Nearby sites have recently been developed for residential use as sites for high-rise apartment buildings. On the basis of that development and recent zoning and other changes that facilitated the residential development, the entity determines that the land currently used as a site for a factory could also be developed as a site for residential use because market participants would take into account the potential to develop the site for residential use when pricing the land.

3.6.1.B Valuation approaches

As discussed at 3.6.1 above, Section 17 states that the fair value of land and buildings is usually determined from market-based evidence by appraisal that is normally undertaken by professionally qualified valuers. The fair value of items of plant and equipment is usually their market value determined by appraisal. [FRS 102.17.15C].

Section 2A then provides further guidance on determining fair value.

Section 2A does not prescribe the types of valuation techniques an entity might use to measure fair value but instead focuses on the types of inputs that will be used. Section 2A requires the entity to use the valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value, maximising the use of inputs determined by reference to a market price in an active market. [FRS 102.2A.15].

The objective is that the best available inputs must be used in valuing the assets. These inputs could be used in any valuation technique provided they are consistent with the three valuation approaches in the standard: the market approach, the cost approach and the income approach. [FRS 102.2A.16]. However, as set out previously, Section 17 itself indicates that where there is market-based evidence of fair value, a market approach would be most common for PP&E.

Extract from Section 2A

2A.16 An entity shall use valuation techniques consistent with one or more of these approaches:

- a) the market approach uses prices and other relevant information generated by market transactions involving identical or comparable assets, liabilities or a group of assets and liabilities, such as a business.
- b) the cost approach reflects the amount that would be required currently to replace the service capacity of an asset (often referred to as current replacement cost).
- c) the income approach reflects expectations of future performance (eg cash flows or income and expenses). Valuation techniques using the income approach include present value techniques, option pricing models, and the multi-period excess earnings method.

Section 2A does not elaborate further on these three approaches, but IFRS 13 does provide some further guidance which an entity may wish to consider.

For PP&E, market techniques will usually involve market transactions in comparable assets or, for certain assets valued as businesses, market multiples derived from comparable transactions. [IFRS 13.B6]. Income or depreciated replacement cost approaches may be required where there is no market-based evidence of fair value, and are discussed further at 3.6.2 below.

Valuation techniques must be applied consistently. However, a change in a valuation technique or its application is appropriate if the change results in a measurement that is equally or more representative of fair value. A change in a valuation technique is considered a change in an accounting estimate in accordance with Section 10, although an entity need not provide the disclosures required by paragraph 18. [FRS 102.2A.17].

Section 2A sets out a methodology that entities must apply to estimate fair value, based on the fair value hierarchy established in IFRS 13. Under this methodology:

- a) The best evidence of fair value is an unadjusted quoted price for an identical or comparable asset or liability in an active market at the measurement date.
- b) When an unadjusted quoted price is not available, the price of a recent orderly transaction between market participants for an identical or comparable asset or liability provides evidence of fair value, although the standard notes that this may not provide a reliable estimate of fair value if there has been a significant change in economic circumstances or a significant period of time has elapsed since the date of the transaction.
- c) If neither (a) nor (b) above are available or reliable, the fair value must be estimated using another valuation technique. [FRS 102.2A.15].

The valuation techniques, referred to above, will use a combination of inputs to determine the fair value of the asset. Land and buildings are the most commonly revalued items of PP&E. These types of assets use a variety of inputs such as other sales, multiples or discounted cash flows.

3.6.2 Fair value in the absence of market-based evidence

If there is no market-based evidence of fair value because of the specialised nature of the item of PP&E and the item is rarely sold, except as part of a continuing business, an entity may need to estimate fair value using an income or a depreciated replacement cost (DRC) approach (see 3.6.1.B above and 3.6.2.A and 3.6.2.B below). [FRS 102.17.15D].

The basis underlying the income or DRC approach is that the asset is so specialised that there is no market value for it. There are three main subsets of such assets: (a) those that are only ever sold as part of a business; (b) assets primarily used to provide services to the public (whether on a paying or non-paying basis); and (c) assets that are so specialised by nature of their size or location or similar features that there is no market for them.

Examples of specialised properties include:

- Oil refineries and chemical works where, usually, the buildings are no more than housings or cladding for highly specialised plant.
 - Power stations and dock installations where the building and site engineering works are related directly to the business of the owner, it being highly unlikely that they would have a value to anyone other than a company acquiring the business.
 - Schools, colleges, universities and research establishments where there is no competing market demand from other organisations using these types of property in the locality.
 - Hospitals, other specialised health care premises and leisure centres where there is no competing market demand from other organisations wishing to use these types of property in the locality.
- And
- Museums, libraries, and other similar premises provided by the public sector.

In addition, there may be no market-based evidence for properties of such specialised construction, arrangement, size or specification that it is unlikely that there would be a single purchaser. The same may be the case even for standard properties in geographical areas remote from main business centres, perhaps originally located there for operational or business reasons that no longer exist. This could occur if the buildings were of such an abnormal size for the district that no market for them would exist.

3.6.2.A Income approach to fair value

The income approach reflects expectations of future performance (e.g., cash flows or income and expenses). [FRS 102.2A.16]. Such techniques convert those future cash flows or income and expenses to a single discounted amount. The fair value reflects current market expectations about those future amounts. In the case of PP&E, this will usually mean using a discounted cash flow technique.

Further discussion of this valuation technique can be found at section 4.11.3 in Chapter 10.

3.6.2.B Depreciated replacement cost

DRC is defined as the most economic cost required for the entity to replace the service potential of an asset (including the amount that the entity will receive from its disposal at the end of its useful life) at the reporting date. [FRS 102 Appendix I]. The objective of DRC is to make a realistic estimate of the current cost of constructing an asset that has the same service potential as the existing asset. DRC approaches are often applied to the valuation of plant and machinery, as distinct from property assets, where there is rarely a market from which to derive a fair value.

Neither Section 17 nor Section 2A provide additional guidance on determining DRC, but we note that Section 2A, consistent with IFRS 13, requires that fair value be determined using the assumptions that market participants would use when pricing the asset or liability. Entities may look to the guidance in IFRS 13, which states that, from a market participants perspective, the price that would be received for the asset is based on the cost to a market participant buyer to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. That is because a market participant buyer would not pay more for an asset than the amount for which it could replace the service capacity of that asset.

To ensure that a valuation on a depreciated replacement cost basis is consistent with the requirements of Section 2A, an entity must ensure that both:

- The highest and best use (see 3.6.1.A above) of the assets is consistent with their current use.
- And
- The exit market for the asset (i.e., the principal market or in its absence, the most advantageous market) is the same as the entry market (i.e., the market in which the asset was/will be purchased).

The principal market is the market for the asset that has the greatest volume or level of activity for the asset or liability. The most advantageous market is the one that maximises the amount that would be received to sell the asset or minimises the amount that would be paid to transfer the liability, after considering transaction costs and transport costs. [FRS 102 Appendix I]. See Chapter 10.

The resulting depreciated replacement cost must also be assessed to ensure market participants would actually transact for the asset in its current condition and location at this price. In particular, an entity must ensure that both:

- The inputs used to determine replacement cost are consistent with what market participant buyers would pay to acquire or construct a substitute asset of comparable utility.
- And
- The replacement cost has been adjusted for obsolescence that market participant buyers would consider so that the adjustment reflects all forms of obsolescence (i.e., physical deterioration, technological (functional) and economic obsolescence and environmental factors), which is broader than depreciation calculated in accordance with Section 17.

3.6.3 Accounting for revaluation surpluses and deficits

The revaluation of PP&E under Section 17 of FRS 102 is an application of the 'alternative accounting rules'. The alternative accounting rules are contained in Schedule 1 of The Large and Medium Sized Companies and Groups (Accounts and Reports) Regulations 2008 ('the Regulations'), and under those rules tangible fixed assets may be included at a market value determined as at the date of their last valuation. [1 Sch 32(2)]. Those rules also set out that the amount of any profit or loss arising from the revaluation of those assets must be credited or (as the case may be) debited to a separate reserve ('the revaluation reserve').

[1 Sch 35(1)].

Accordingly, increases in the carrying amount of PP&E as a result of revaluations are recognised in OCI and accumulated in equity i.e., the revaluation reserve, except to the extent that a revaluation increase of an asset reverses a revaluation decrease of the same asset that was previously recognised as an expense in profit or loss, whereby such increase must be credited to income in profit or loss. [FRS 102.17.15E]. Decreases as a result of revaluation are recognised in OCI to the extent of any previously recognised revaluation increase accumulated in revaluation reserve in respect of the same asset. If a revaluation decrease exceeds

the revaluation gains accumulated in revaluation reserve in respect of that asset, the excess is recognised in profit or loss. [FRS 102.17.15F]. This means that it is not permissible under Section 17 to carry a negative revaluation reserve in respect of any individual item of PP&E.

The same rules apply to impairment losses. Any impairment loss of a revalued asset must be treated as a revaluation decrease in accordance with Section 17. [FRS 102.27.6].

3.6.3.A Depreciation of revalued assets

The fundamental objective of depreciation is to reflect in operating profit the cost of use of an item of PP&E (i.e., the amount of economic benefits consumed) in the period. This requires a charge to operating profit even if the asset has changed in value or has been revalued.

Section 17 is not specific as to the base amount of an item of PP&E to be used when computing the depreciation charge for the period. It might be best to use the average carrying value during the year, or else, the opening or closing balance may be used provided that it is used consistently in each period. In practice, the depreciation charge is generally based on the opening value and the written down asset is revalued as at the end of accounting period. The depreciation charge must be recognised as an expense, unless it qualifies to be capitalised as part of another asset (see discussion at 3.5 above).

Amounts taken to OCI as a result of revaluations are not subsequently recognised in the profit and loss account (a process commonly referred to as 'recycling' under IFRS). However, while not explicitly addressed in Section 17, the revaluation surplus included in OCI may be transferred directly to retained earnings as the surplus is realised. [1 Sch 35(3)]. A revaluation surplus may become realised as a result of the related asset being disposed of in exchange for 'qualifying consideration', or as a result of a realised loss being recognised in respect of the asset, for example as a result of write downs for depreciation and impairment (see TECH 02/17BL, paragraph 3.9).

Accordingly, the revaluation surplus included within equity in respect of an item of PP&E may be transferred directly to retained earnings when the asset is derecognised (i.e., transferring the whole of the surplus when the asset is retired or disposed of). In addition, some of the revaluation surplus may be transferred to retained earnings as the asset is used by an entity. In such a case, the difference between depreciation based on the revalued carrying amount of the asset and depreciation based on its original cost may be transferred from the revaluation reserve to retained earnings. This recognises that any depreciation of the revalued part of an asset's carrying value is considered realised by being charged to profit or loss. Thus, a transfer may be made of an equivalent amount from the revaluation surplus to retained earnings. This is shown in Illustration 3-10 below. Any remaining balance may be transferred from revaluation reserve to retained earnings when the asset is derecognised (see 3.7 below). Revaluation gains or losses arising from the disposal of PP&E are not subsequently recognised ('recycled') in profit or loss. Illustration 3-11 shows the effect of depreciation on the revaluation reserve, including the possible transfer directly between the revaluation and the profit and loss reserve:

Illustration 3-11: Effect of depreciation on the revaluation reserve

On 1 January 20X5 an entity acquired an asset for £1,000. The asset has an economic life of ten years and is depreciated on a straight-line basis. The residual value is assumed to be £nil. At 31 December 20X8 (when the cost net of accumulated depreciation is £600) the asset is valued at £900. The entity accounts for the revaluation by debiting the carrying value of the asset (using either of the methods discussed below) £300 and crediting £300 to the revaluation reserve. At 31 December 20X8 the useful life of the asset is considered to be the remainder of its original life (i.e., six years) and its residual value is still considered to be £nil. In the year ended 31 December 20X9 and in later years, the depreciation charged to profit or loss is £150 (£900/6 years remaining).

Accordingly, the treatment thereafter for each of the remaining 6 years of the asset's life, is to transfer £50 (£300/6 years) each year from the revaluation reserve to retained earnings (not through profit or loss). This avoids the revaluation reserve being maintained indefinitely even after the asset ceases to exist, which does not seem sensible. This treatment is also permitted by Companies Act which allows amounts to be transferred to the profit and loss account reserve if the amount has previously been charged in that account or is a realised profit. A transfer is possible because the amount of £50 is a realised profit in terms of the Companies Act. [s841(5), 1 Sch 35(3)].

The effect on taxation, both current and deferred, of a policy of revaluing assets is recognised and disclosed in accordance with Section 29 *Income Tax*. This is dealt with in Chapter 31.

When an item of PP&E is revalued, the carrying amount of that asset is adjusted to the revalued amount. FRS 102 does not provide specific guidance on accounting for accumulated depreciation when an item of PP&E is revalued, but there are two usual methods of adjusting the carrying amount. At the date of revaluation, the asset is treated in one of the following ways:

- The accumulated depreciation is eliminated against gross carrying amount of the asset and the carrying amount is then restated to the revalued amount of the asset.
- The gross carrying amount is adjusted in a manner that is consistent with the revaluation of the carrying amount of the asset. For example, the gross carrying amount may be restated by reference to observable market data or it may be restated proportionately to the change in the carrying amount of the asset. The accumulated depreciation at the date of the revaluation is adjusted to equal the difference between the gross carrying amount and the carrying amount of the asset after taking into account accumulated impairment losses.

The first method available eliminates the amount of accumulated depreciation to the extent of the difference between the revalued amount and the carrying amount of the asset immediately before revaluation. This is shown in Illustration 3-12:

Illustration 3-12: Revaluation by eliminating accumulated depreciation

On 31 December, a building has a carrying amount of £40,000, being the original cost of £70,000 less accumulated depreciation of £30,000. A revaluation is performed and the fair value of the asset is £50,000. The entity would record the following journal entries:

Dr	Accumulated depreciation	£30,000	
	Cr Building		£20,000
	Cr Asset revaluation reserve (through OCI)		£10,000

	Before	After
	£	£
Building at cost	70,000	
Building at valuation		50,000
Accumulated depreciation	30,000	-
Net book value	40,000	50,000

Illustrations 3-13 and 3-14 provide two alternative approaches to recognising the revaluation of the asset by adjusting the gross carrying amount in a manner that is consistent with the revaluation of the carrying amount of the asset. In Illustration 3-13, the gross carrying amount is restated by reference to observable market data:

Illustration 3-13: Revaluation by restating the gross carrying amount by reference to observable market data

As in Illustration 3-12, on 31 December, a building has a carrying amount of £40,000, being the original cost of £70,000 less accumulated depreciation of £30,000. A revaluation is performed, and the fair value of the asset is £50,000.

Rather than accounting for the revaluation by eliminating the accumulated depreciation against gross carrying amount of the asset, the gross carrying amount is restated to £75,000 by reference to observable market data. The accumulated depreciation then has to be adjusted to £25,000 (i.e., the gross carrying amount of £75,000 less the carrying amount adjusted to its revalued amount of £50,000). As such, the entity would record the following journal entry:

Dr	Accumulated depreciation	£5,000	
Dr	Building	£5,000	
	Cr Asset revaluation reserve (through OCI)		£10,000

	Before	After
	£	£
Building at cost	70,000	
Building at valuation		75,000
Accumulated depreciation	30,000	25,000
Net book value	40,000	50,000

Illustration 3-14 provides another possible approach to recognising the revaluation of the asset by adjusting the gross carrying amount in a manner that is consistent with the revaluation of the carrying amount of the asset. In this case, the gross carrying amount is restated proportionately to the change in the carrying amount:

Illustration 3-14: Revaluation by restating the gross proportionately to the change in the carrying amount

As in Illustrations 3-12 and 3-13, on 31 December, a building has a carrying amount of £40,000, being the original cost of £70,000 less accumulated depreciation of £30,000. A revaluation is performed, and the fair value of the asset is £50,000.

In this case, the revaluation is recorded by restating gross carrying amount proportionately to the change in carrying amount. As the fair value of the asset is £50,000 and the carrying amount is £40,000 at the date of the revaluation, this gives rise to a 25% uplift. This method results in the same revaluation gain as the methods in Illustrations 3-12 and 3-13 above but the cost and accumulated depreciation carried forward reflect the gross cost of the asset of £87,500 and accumulated depreciation of £37,500. This method may be used if an asset is revalued using an index to determine its depreciated replacement cost.

As such, the entity would record the following journal entry:

Dr	Building	£17,500	
	Cr	Accumulated depreciation	£7,500
	Cr	Asset revaluation reserve (through OCI)	£10,000

	Before	After
	£	£
Building at cost	70,000	
Building at valuation		87,500
Accumulated depreciation	30,000	37,500
Net book value	40,000	50,000

Notice that the revaluation gain recognised remained at £10,000 whichever method described above is used.

3.6.4 Reversals of downward valuations

Section 17 requires that, if an asset's carrying amount is increased as a result of a revaluation, the increase must be credited directly to OCI and accumulated in equity. However, the increase must be recognised in profit or loss to the extent that it reverses a revaluation decrease of the same asset previously recognised in profit or loss. [FRS 102.17.15E].

How we see it

If the revalued asset is being depreciated, we consider that the full amount of any reversal is not taken to profit or loss. Rather, the reversal must take account of the depreciation that would have been charged on the previously higher book value.

The text of Section 17 does not specify this treatment, but such treatment is consistent with Section 27, which states:

Extract from Section 27

27.30(c) The reversal of an impairment loss shall not exceed the carrying amount of the asset above the carrying amount that would have been determined (net of amortisation or depreciation) had no impairment loss been recognised for the asset in prior years.

The following Illustration demonstrates a way in which this could be applied:

Illustration 3-15 Reversal of a downward valuation

An asset has a cost of £1,000,000, a life of 10 years and a residual value of £nil. At the end of year 3, when the asset's depreciated cost is £700,000, it is revalued to £350,000. This write down below cost of £350,000 is taken through profit or loss.

The entity then depreciates the asset by £50,000 per annum, so as to depreciate the revalued carrying amount of £350,000 over the remaining 7 years.

At the end of year 6, the asset's carrying amount is £200,000 but it is now revalued to £500,000. The effect on the entity's asset is as follows:

	£000
<i>Valuation</i>	
At the beginning of year 6	350
Surplus on revaluation	<u>150</u>
At the end of the year	500
<i>Accumulated depreciation</i>	
At beginning of year 6*	100
Charge for the year	50
Accumulated depreciation written back on revaluation	<u>(150)</u>
At the end of the year	-
Carrying amount at the end of year 6	500
Carrying amount at the beginning of year 6	250

* Two years' depreciation (years 4 and 5) at £50,000 per annum.

Upon the revaluation in year 6 the total uplift in the asset's carrying amount is £300,000 (i.e., £500,000 less £200,000). This is because the reversal recognised in profit and loss is restricted to take account of the depreciation that would have been charged on the previously higher book value, achieving the same overall effect that would have been reached had the original downward revaluation not occurred.

In this case, had the previous downwards revaluation not occurred, the total cumulative charges reported in profit or loss at the end of year 6 would have been CU600,000 (comprising 6 years of depreciation at CU100,000 per annum), and the carrying value of the asset would have been CU400,000.

Instead, a total of CU800,000 has been recognised in profit or loss, reflecting the CU350,000 downwards revaluation and a total of CU450,000 of depreciation (comprising 3 years of depreciation at CU100,000 per annum and 3 years at the reduced amount of CU50,000 per annum). Therefore, the total reversal through profit or loss is restricted to the difference between these two figures of CU200,000. The remaining CU100,000 will be credited to OCI and taken to the revaluation surplus.

From the beginning of year 7 the £500,000 asset value will be written off over the remaining four years at £125,000 per annum.

In Illustration 3-15 above, the amount of the revaluation that is credited to the revaluation surplus in OCI represents the difference between the carrying amount that would have resulted had the asset always been held on a cost basis since initial recognition (£400,000) and the carrying amount on a revalued basis (£500,000).

This might be considered as an extreme example. Most assets that are subject to a policy of revaluation would not show such marked changes in value and it would be expected that there would be valuation movements in the intervening years rather than dramatic losses and gains in years 3 and 6. However, we consider that in principle this is the way in which downward valuations must be recognised.

There may be major practical difficulties for any entity that finds itself in the position of reversing revaluation deficits on depreciating assets, although whether in practice this eventuality often occurs is open to doubt. If there is any chance that it is likely to occur, the business would need to continue to maintain asset registers on the original, pre-write down, basis.

3.6.5 Adopting a policy of revaluation

Although the adoption of a policy of revaluation by an entity that has previously used the cost model is a change in accounting policy, it is not dealt with as a prior year adjustment in accordance with Section 10. Instead, the change is treated as a revaluation during the year, as described at 3.6.3 and 3.6.4 above. [FRS 102.10.10A]. This means that the entity is not required to obtain valuation information about comparative periods.

This is an exception to the general principle in Section 10 of FRS 102 (whereby changes in accounting policy must be recognised retrospectively), and it only applies to a change to a policy of revaluation. If an entity changes its accounting policy from the revaluation model to the cost model, the usual requirements to changes in accounting policies apply, meaning the effect of the change is calculated retrospectively as if the cost model had always been applied. For further discussion of changes in accounting policy, see Chapter 9 at 3.3.

3.6.6 Assets held under leases

Under Section 20 lessees are required to recognise most leases in their statement of financial position as lease liabilities with corresponding right-of-use assets. A lessee subsequently measures the right-of-use asset using a cost model under Section 20 (applying the depreciation requirements in Section 17, but subject to the specific requirements in paragraph 58 of Section 20), unless it applies one of the following measurement models allowed by Section 20 (see Chapter 23 at 6.3.1.B):

- The fair value model in Section 16 applied to right-of-use assets that meet the definition of investment property, unless applying the exemption in paragraph 16.4A(b)(ii).
Or
- If the lessee applies the revaluation model in Section 17 to a class of PP&E, the lessee would also have the option to revalue all the right-of-use assets that relate to that class of PP&E. [FRS 102.20.60, FRS 102.20.61].

3.7 Derecognition

Derecognition i.e., removal of the carrying amount of the item from the financial statements of the entity, occurs when an item of PP&E is either disposed of, or when no further economic benefits are expected to flow from its use or disposal. [FRS 102.17.27]. The disposal of an item of PP&E may occur in a variety of ways (e.g., by sale, by entering into a finance lease or by donation). The actual date of disposal of an item of PP&E is the date the recipient obtains control of that item in accordance with the requirements in Section 23 for determining when a performance obligation is satisfied. Section 20 applies to disposal by way of a sale and leaseback. [FRS 102.17.29]. Revenue recognition under Section 23 is discussed in Chapter 25.

All gains and losses on derecognition must be included in profit and loss for the period (although, except as discussed in 3.7.1 below, gains must not be classified as revenue) when the item is derecognised, unless another standard applies, e.g., under Section 20, a sale and leaseback transaction might not give rise to a gain. [FRS 102.17.28]. See Chapter 23 for more detail.

Gains and losses are to be calculated as the difference between any net disposal proceeds and the carrying value of the item of PP&E. [FRS 102.17.30]. This means that any revaluation surplus relating to the asset disposed of is transferred directly to retained earnings when the asset is derecognised and not reflected in profit or loss.

Replacement of 'parts' of an asset requires derecognition of the carrying value of the original part, even if that part was not being depreciated separately. In these circumstances, it might be acceptable to estimate using the cost of a replacement part to be a guide to the original cost of the replaced part, if that cannot be determined. See discussion at 3.2.3 above.

Section 17 does not provide further guidance on how the disposal proceeds must be determined. Entities may look to the requirements in IAS 16, under which the amount of consideration to be included in the gain or loss arising from the derecognition of an item of PP&E is required to be determined in accordance with the requirements for determining the transaction price in paragraphs 47 to 72 of IFRS 15. Similar requirements in FRS 102 are contained in paragraphs 41 to 64 of Section 23 (see Chapter 25). Similarly, entities could look to IFRS for guidance on the accounting for any subsequent changes to the estimated amount of the consideration. Under IAS 16, subsequent changes to the estimated amount of the consideration included in the gain or loss are accounted for in accordance with the requirements for

changes in the transaction price in paragraphs 87 to 90 of IFRS 15. Similar requirements in FRS 102 are contained in paragraphs 75 to 77 of Section 23 (see Chapter 25).

There could be a few fully depreciated assets still in use. For those fully depreciated assets that are no longer in use, it may be practical to derecognise them, rather than continue to carry them at their gross cost and accumulated depreciation.

3.7.1 Sale of assets held for rental

If an entity, in the course of its ordinary activities, routinely sells PP&E that it has held for rental to others, it must transfer such assets to inventories at their carrying amount when they cease to be rented and are then held for sale. Accordingly, the proceeds from the sale of such assets must be recognised as revenue. While this is not specified in Section 17, this treatment appears reasonable and is consistent with the specific provisions in IAS 16 paragraph 68A. In contrast, the sale of investment property is generally not recognised as revenue.

A number of entities sell assets that have previously been held for rental, for example, car rental companies that may acquire vehicles with the intention of holding them as rental cars for a limited period and then selling them. One issue is whether the sale of such assets, which arguably have a dual purpose of being rented out and then sold, must be presented gross (revenue and cost of sales) or net (gain or loss) in profit or loss.

It would be reasonable to consider the IFRS conclusion in this scenario. The IASB concluded that the presentation of gross revenue, rather than a net gain or loss, would better reflect the ordinary activities of some such entities. [IAS 16.BC35C]. Accordingly, when preparing a statement of cash flows, both (i) the cash payments to manufacture or acquire assets held for rental and subsequently held for sale; and (ii) the cash receipts from rentals and sales of such assets would be presented as from operating activities. [IAS 7.14]. This is intended to avoid initial expenditure on purchases of assets being classified as investing activities while inflows from sales are recorded within operating activities.

3.7.2 Partial disposals and undivided interests

Section 17 requires an entity to derecognise 'an item' of PP&E on disposal or when it expects no future economic benefits from its use or disposal. [FRS 102.17.27].

Items of PP&E are recognised when their costs can be measured reliably, and it is probable that future benefits associated with the asset will flow to the entity. [FRS 102.17.4]. Section 17 does not prescribe the unit of measurement for recognition, i.e., what constitutes an item of PP&E.

However, items that are derecognised were not necessarily items that were identified separately on initial recognition. The item that is being disposed of may be part of a larger 'item' bought in a single transaction that can be subdivided into parts (i.e., separate items) for separate disposal; an obvious example is land or many types of property. The principle is the same as for the replacement of parts, which may only be identified and derecognised so that the cost of the replacement part may be recognised (see 3.2.3 above). The entity needs to identify the cost of the part disposed of by allocating the carrying value on a systematic and appropriate basis.

Section 17 assumes that disposal will be of a physical part (except in the specific case of major inspections and overhauls - see 3.2.3.B above). However, some entities enter into arrangements in which they dispose of part of the benefits that will be derived from the assets.

Although Section 17 defines an asset by reference to the future economic benefits that will be controlled by the entity as a result of the acquisition, it does not address disposals of a proportion of these benefits. An entity may dispose of an undivided interest in the whole asset (sometimes called an ownership 'in common' of the asset). This means that all owners have a proportionate share of the entire asset (e.g., the purchaser of a 25% undivided interest in 100 acres of land owns 25% of the whole 100 acres). These arrangements are common in, but are not restricted to, the extractive and property sectors. Vendors have to determine how to account for the consideration they have received from the purchaser. This will depend on the details of the arrangement and, in particular, whether the entity continues to control the asset or if there is joint control.

3.7.2.A Joint control

In some cases, after a partial disposal of an item of PP&E, there may be joint control over the asset (e.g., sale of an asset to a joint venture), in which case the arrangement will be within scope of Section 15 *Investments in Joint Ventures* which will determine how to account for the disposal and the subsequent accounting. Joint control is discussed in Chapter 18.

The retained interest will be analysed as a jointly controlled operation (JCO), a jointly controlled assets (JCA) or a jointly controlled entity (JCE). Undivided interests cannot be accounted for as joint ventures in the absence of joint control.

3.7.2.B Vendor retains control

If the asset is not jointly controlled in the subsequent arrangement, the vendor might retain control over the asset. The vendor will recognise revenue, or it will be a financing arrangement. If it is the former, then the issue is the period and pattern over which revenue is recognised.

If the vendor retains control, then it will not meet the criteria in Section 23 for treating the transaction as a sale, i.e., recognising revenue at a point in time on entering into the arrangement. As discussed in Chapter 20, Section 23 requires that revenue (and a gain or loss on disposal of a non-current asset not in the ordinary course of business) be recognised upon satisfaction of a performance obligation by transferring a promised good to a customer. A good is transferred when the customer obtains control (see Chapter 25). [FRS 102.23.78].

The arrangement could be akin to a lease, especially if the disposal is for a period of time. However, arrangements are only within the scope of Section 20 if they relate to a specified asset. Generally, a portion of a larger asset that is not physically distinct is not considered to be a specified asset. The related requirements of Section 20 are discussed in Chapter 23.

If it is not a lease and the vendor continues to control the asset, the arrangement might be best characterised as akin to a performance obligation for services to be spread over the term of the arrangement. That is, the initial receipt would be a liability and recognised in profit and loss over time.

Alternatively, it could be a financing-type arrangement, in which case the proceeds would be classified as a financial liability. In effect, the vendor is trading a share of any revenue to which it is entitled in exchange for funding by the purchaser of one or more activities relating to the asset. The purchaser receives a return that is comparable to a lender's rate of return out of the proceeds of production. This could be by receiving a disproportionate share of output until it has recovered its costs (the financing it has provided) as well as the agreed rate of return for the funding. These arrangements are found in the extractive sector, e.g., carried interests and farm-outs (see Chapter 36). In the development stage of a project, the asset in question will be classified as PP&E or as an intangible asset under Section 18. Under a carried interest arrangement the carried party transfers a portion of the risks and rewards of a property, in exchange for a funding commitment from the carrying party.

3.7.2.C Sale or partial sale of a single-asset entity

Certain assets, particularly properties, may be bought and sold by transferring ownership of a separate legal entity formed to hold the asset (a 'single-asset' entity) rather than the asset itself. The asset could be realised through either an outright sale or partial disposal.

In consolidated financial statements, Section 9 *Consolidated and Separate Financial Statements* states that where a parent disposes of an interest in a subsidiary resulting in a loss of control, the gain or loss on disposal is the difference between:

- The proceeds from the disposal.
- And
- The proportion of the carrying amount of the subsidiary's net assets, including any related goodwill, disposed of (or lost) as at the date of disposal. [FRS 102.9.18A].

Therefore, if a single-asset subsidiary is disposed of in its entirety (and no interest in either the entity, or the underlying asset held by the entity, is retained), the gain or loss on disposal in the consolidated financial statements is the difference between the disposal proceeds and the carrying amount of the asset held by the single asset entity. This is consistent with the normal derecognition requirements for PP&E in Section 17 which state that the gain or loss arising from the derecognition of an item of PP&E is calculated as the difference between the net disposal proceeds, if any, and the carrying amount of the item.

[FRS 102.17.30].

A scenario such as this, in which a wholly owned single-asset entity is disposed of in its entirety, may be straight-forward, but scenarios involving a partial disposal of an investment in a single-asset entity that results in a loss of control can give rise to complexities, and the type of investment that is retained will need to be considered in determining the appropriate accounting for the retained interest and the gain or loss on disposal. Possible scenarios which may arise include:

- The retained interest is an investment in either an associate or a jointly controlled entity. In such a case, that retained interest will be accounted for using the equity method under Section 14 *Investments in Associates*. The carrying amount of the net assets attributable to the investment at the date of the disposal is regarded as the cost on initial measurement of the investment in associate or jointly controlled entity, as appropriate. See Chapter 17.
- The retained interest is an investment in an entity that is not an associate or jointly controlled entity. In such a case, that investment will be accounted for as a financial asset in accordance with Section 11 *Basic Financial Instruments* or Section 12 from the date of the partial disposal. The carrying amount of the net assets attributable to the investment at the date of the disposal is regarded as the cost on initial measurement of the financial asset. See Chapter 13. [FRS 102.9.19, FRS 102.15.18].

3.8 Presentation of PP&E

An entity reporting under Schedule 1 using the 'statutory formats' (see Chapter 6) is required to present PP&E on the face of statement of financial position. The main heading must be 'Tangible assets'. The following required subheadings may be shown either on the face of the statement of financial position or in the notes:

- Land and buildings
- Plant and machinery
- Fixtures, fittings, tools and equipment
- And
- Payments on account and assets in course of construction

Subheadings may not be limited to those above.

A Schedule 1 entity using the 'adapted formats' (see Chapter 6) is required to present PP&E as a separate line item on the statement of financial position. FRS 102 also requires that sub-classifications of PP&E that are appropriate to the entity are presented, either on the face of the statement of financial position or in the notes. [FRS 102.4.2B(a)].

FRS 102 does not include the concept in IFRS of non-current assets and disposal groups held for sale, and the 'adapted formats', therefore, do not require separate presentation for such items. FRS 102 also does not address whether items such as PP&E must be reclassified as current if expected to be realised within twelve months after the reporting period.

How we see it

In our view, an entity should generally continue to classify PP&E intended to be disposed of as non-current unless it is expected to be realised within 12 months after the reporting period (in which case it must be classified as current).

However, an entity that, in the course of its ordinary activities, routinely sells items of PP&E that it has held for rental to others, must transfer such assets to inventory when they cease to be rented and become held for sale, consistent with IFRS requirements. [IAS 16.68A]. See 3.7.1 above. The inventory must then be classified as current or non-current in accordance with the definitions set out in Chapter 6, with particular reference to item (a) of the definition of non-current asset.

3.9 Disclosures

The main disclosure requirements of Section 17 are set out at 3.9.1 below. Other disclosures required by other sections of FRS 102 and Companies Act in respect of PP&E are included in 3.9.2 and 3.9.3 below, respectively.

3.9.1 Disclosures required by Section 17

For each class of PP&E the following must be disclosed in the financial statements:

- The measurement bases used for determining the gross carrying amount (e.g., cost or revaluation)
- The depreciation methods used
- The useful lives or the depreciation rates used
- The gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the reporting period

And

- A reconciliation of the carrying amount at the beginning and end of the reporting period, which need not be presented for prior periods, showing separately the following:
 - Additions
 - Disposals
 - Acquisitions through business combinations
 - Revaluations
 - Transfers to or from investment property
 - Impairment losses recognised or reversed in profit or loss during the period under Section 27
 - Depreciation for the period
- And
- Other changes *[FRS 102.17.31]*

Where an entity has chosen to account for investment properties rented to other group entities using the cost model it should disclose their carrying amount at the end of the reporting period. *[FRS 102.17.31A]*.

An entity should also disclose the following:

- The existence and carrying amounts of PP&E to which the entity has restricted title or that is pledged as security for liabilities.

And

- The amount of contractual commitments for the acquisition of PP&E. *[FRS 102.17.32]*.

In addition to above disclosures, if items of PP&E are stated at revalued amounts, the following should be disclosed:

- The effective date of the revaluation.
- Whether an independent valuer was involved.
- The methods and significant assumptions applied in estimating the items' fair values.

And

- For each revalued class of PP&E, the carrying amount that would have been recognised had the assets been carried under the cost model. *[FRS 102.17.32A]*.

The requirement under the last bullet point above can be quite onerous for entities, as it involves maintaining asset register information in some detail in order to meet it.

When both the cost model and the revaluation model have been used, the gross carrying amount for that basis in each category will have to be disclosed (however the standard requires that if revaluation is adopted the entire class of PP&E must be revalued - see 3.6 above). The selection of the depreciation method, useful lives or depreciation rates used is a matter of judgement and the disclosure must provide information to allow users to review the policies selected by management and to compare them with other entities.

All of the disclosures above (other than those related to fair value measurement) are also relevant to an entity that chooses to measure investment properties rented to another group entity under the cost model. *[FRS 102.17.30A]*.

3.9.2 Disclosures required by other sections of FRS 102 in respect of PP&E

In addition to the above disclosures, other sections of FRS 102 require disclosures of specific information relating to PP&E:

- If, at the reporting date, an entity has a binding sale agreement for a major disposal of assets (i.e., PP&E held for sale), a description of the facts and circumstances of the planned sale, and the carrying amount of the assets, is required to be disclosed. [FRS 102.4.14]. See Chapter 6 for further details.
- In accordance with Section 10, the nature and effect of any changes in accounting estimate (e.g., depreciation methods, useful lives, residual values, estimated cost of dismantling, removing or restoring items of PP&E) that have a material effect on the current or future periods must be disclosed. [FRS 102.10.18]. See Chapter 9 for further details.
- Disclosures required for lessees and lessors in respect of items of PP&E subject to lease agreements are covered by Section 20. See Chapter 23 for details.
- In the case of PP&E that is impaired, disclosures are required by Section 27. See Chapter 29 for further details.
- Disclosures in relation to borrowing costs that are capitalised as part of the cost of an item of PP&E are required by Section 25. See Chapter 27 for details.

3.9.3 Additional disclosures required by the Companies Act and the Regulations

The following disclosures are required by the Companies Act and the Regulations in respect of PP&E in addition to those disclosures required by FRS 102:

- An analysis of freehold, long leasehold and short leasehold in respect of disclosures of land and buildings. [1 Sch 53]. For this purpose, a 'lease' is defined to include an agreement for a lease and a 'long lease' as a lease which has 50 years or more to run at the end of the financial year in question, otherwise, it would be a 'short lease'. [10 Sch 7].
- In addition to the disclosures described at 3.9.1 above, the following information must be given for any PP&E that are measured using the revaluation model (i.e., alternative accounting rules) and that have been valued during the financial year:
 - The year of valuation and the amounts of the revaluation.
 - In the year of valuation, the names of the persons who valued them or particulars of their qualifications for doing so.

And

 - The bases of valuation used by them. [1 Sch 52].
- The treatment for taxation purposes of amounts credited or debited to the revaluation reserve must be disclosed in a note to the accounts. [1 Sch 35(6)].
- Where an entity has determined the purchase price or production cost of any asset for the first time using the value ascribed to it in the earliest available record of its value made on or after its acquisition or production by the company, this fact must be disclosed in the notes to its financial statements. [1 Sch 64(1)].

4 Summary of GAAP differences

The key differences between FRS 102 and IFRS in accounting for PP&E are set out below.

	FRS 102	IFRS
Scope	Applies to all items of PP&E except for biological assets related to agricultural activity, heritage assets, mineral rights and reserves and PP&E classified as held for sale. Investment properties rented to another group entity where (as permitted by paragraph 4A of Section 16) the reporting entity chooses to apply the cost model (see 3.1 and 3.4 above) are within the scope of Section 17. A plan to dispose of an asset (i.e., held-for-sale asset) before the previously expected date is an indicator of impairment (i.e., no reclassification or suspension of depreciation - although see 2.1 above).	Applies to all items of PP&E except PP&E classified as held for sale, biological assets related to agricultural activity, mineral rights and reserves and investment properties held at fair value. Recognition and measurement of exploration and evaluation assets are also excluded from its scope. Entities using the cost model for investment properties (including investment properties under construction) use the cost method as prescribed in IAS 16. PP&E classified as held for sale is accounted for under IFRS 5.
	Section 34 does not make a distinction between biological assets and bearer plants. Therefore, bearer plants are treated as biological assets and accounted for in accordance with Section 34.	Biological assets meeting the definition of 'bearer plants' are within the scope of IAS 16.
Classification of computer software	Section 18 sets out that entities are required to use judgement to assess which element is more significant when an asset incorporates both tangible and intangible elements. Operating systems and software without which a machine could not operate is an integral part of the related hardware and is treated as PP&E. When the software is not an integral part of the related hardware, the software is treated as an intangible asset. (see 3.2.1.D above).	Required to use judgement to assess which element is more significant when an asset incorporates both tangible and intangible elements. Software that is not integral to related hardware is treated as an intangible asset. Software which is not an integral part of the related hardware is treated as an intangible asset. Computer software that is an integral part of the related hardware is treated as PP&E.
Cost	If payment for the asset is deferred beyond normal credit terms, the cost is the present value of all future payments (although expected to be materially similar, it is not the cash price equivalent at the recognition date like in IAS 16).	If payment for the asset is deferred beyond normal credit terms, interest is recognised over the period of credit (unless capitalised per IAS 23 - <i>Borrowing Costs</i>) i.e., the measurement of cost of a PP&E is the cash price equivalent at the recognition date.
	Capitalisation of directly attributable borrowing costs in respect of a qualifying asset is permitted but not required.	Borrowing costs related to a qualifying asset must be capitalised.
	Subject to conditions (e.g., transaction has economic substance, and fair value is reliably measurable), FRS 102	Subject to conditions (e.g., transaction has economic substance, and fair value is reliably measurable), IAS 16 requires

	FRS 102	IFRS
	requires all acquisitions of PP&E in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value. Any resulting gain or loss is likely to be an unrealised profit or loss and would be reported in OCI.	all acquisitions of PP&E in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value. Any resulting gain or loss is reported in the income statement.
	If income is generated wholly and necessarily as a result of the process of bringing the asset into the location and condition for its intended use, for example from the sale of samples produced when testing the equipment concerned to determine whether the asset is functioning properly, then the income must be credited to the cost of the asset. It will be a matter of judgement as to when the asset is in the location and condition intended by management, but capitalisation (including the recording of income as a credit to the cost of the asset) ceases when the asset is fully operational, regardless of whether or not it is yet achieving its targeted levels of production or profitability.	IAS 16 requires that the proceeds from selling items produced whilst bringing an item of PP&E into the location and condition necessary for it to be capable of operating in the manner intended by management, and the cost of those items, are recognised in profit or loss. The cost of those items is determined by applying the measurement requirements of IAS 2 <i>Inventories</i>.
Revaluation model	Section 17 does not have detailed guidance on accumulated depreciation when assets are revalued. However, we expect that FRS 102 adopters will follow the approach similar to IFRS (see 3.6.3.A above).	IAS 16 provides detailed guidance on accumulated depreciation when assets are revalued.
	Section 17 is silent on transfers of a revaluation surplus to retained earnings. However, the Regulations permit such transfers of amounts if the amount represents realised profit (see 3.6.3.A above).	IAS 16 provides detailed guidance on transfers of revaluation surplus to retained earnings - i.e., as the asset is used by an entity or when the related asset is derecognised.
Depreciation of assets/impairment	Depreciation ceases at the end of the useful life or on disposal of the asset.	Depreciation of an asset ceases when the asset is either classified as held for sale or derecognised.
	No equivalent guidance in respect of non-depreciation if an asset's residual value is equal to or exceeds its carrying amount. However, we expect that FRS 102 adopters will follow an approach similar to IFRS (see 3.5 above).	If an asset's residual value is equal to or exceeds its carrying amount the asset is not depreciated until its residual value subsequently decreases to an amount below the assets' carrying amount.
	There is no explicit prohibition of the use of 'revenue expected to be generated' as the basis to depreciate PP&E. However, under Section 17, the depreciation method selected must reflect the pattern in which the asset's	The use of revenue-based depreciation is inappropriate and thus, prohibited.

FRS 102		IFRS
	future economic benefits are expected to be consumed, and whilst revenue reflects the output of the asset, it also reflects other factors that do not affect depreciation. Therefore, despite the fact that revenue-based depreciation is not explicitly prohibited under FRS 102, a revenue-based depreciation method is not appropriate where it does not reflect the consumption of the economic benefits of the asset.	
	Reassessment of depreciation methods and residual values are only required if there is an indication that it has changed since the most recent annual reporting date.	Depreciation methods and residual value must be reassessed at least annually. Depreciation methods are changed if there is a significant change in the expected pattern of consumption.
Disposal of PP&E	Under FRS 102 gains and losses on disposal are to be calculated as the difference between any net disposal proceeds and the carrying value of the item of PP&E. <i>[FRS 102.17.30]</i> . Section 17 does not provide further guidance on how the disposal proceeds must be determined.	IAS 16 requires that the amount of consideration on disposal to be included in the gain or loss on derecognition of PP&E must be determined in accordance with the requirements for determining the transaction price in IFRS 15. In addition, subsequent changes to the estimated amount of consideration included in the gain or loss must be accounted for in accordance with the requirements for changes in transaction price in IFRS 15. <i>[IAS 16.72]</i>
Disclosures	Reconciliation disclosure (i.e., opening balances to ending balances) required only for the current period.	Reconciliation disclosure (i.e., opening balances to ending balances) required for both current and comparative period.
	Where an entity has chosen to account for investment properties rented to other group entities using the cost model it must disclose their carrying amount at the end of the reporting period (see 3.9.1 above).	Disclosure requirement is not applicable as this accounting policy choice is not available under IFRS.

Appendix A - Defined terms

Extract from FRS 102

Appendix I

Glossary

borrowing costs	Interest and other costs incurred by an entity in connection with the borrowing of funds
carrying amount	The amount at which an asset or liability is recognised in the statement of financial position
depreciable amount	The cost of an asset, or other amount substituted for cost (in the financial statements), less its residual value
depreciated replacement cost	The most economic cost required for the entity to replace the service potential of an asset (including the amount that the entity will receive from its disposal at the end of its useful life) at the reporting date.
depreciation	The systematic allocation of the depreciable amount of an asset over its useful life.
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in Section 2A <i>Fair Value Measurement</i> shall be used in determining fair value.
property, plant and equipment	Tangible assets that: a) are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes; and b) are expected to be used during more than one period.
recoverable amount	The higher of an asset's (or cash-generating unit's) fair value less costs to sell and its value in use.
residual value	The estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.
useful life	The period over which an asset is expected to be available for use by an entity, or the number of production or similar units expected to be obtained from the asset by an entity.

Overview

This chapter deals with the requirements of Section 18 *Intangible Assets other than Goodwill*. Section 18 addresses the nature, recognition and measurement of intangible assets other than goodwill.

Section 18 applies to all intangible assets, other than the following:

- Goodwill
- Intangible assets held for sale in the ordinary course of business
- Assets arising from contracts with customers that are recognised in accordance with Section 23 *Revenue from Contracts with Customers* (see Chapter 25)
- Financial assets
- Heritage assets
- Exploration for and evaluation of mineral resources, such as oil, natural gas and similar non-regenerative resources and expenditure on the development and extraction of such resources
- And
- Deferred acquisition costs and intangible assets arising from contracts in the scope of FRS 103 *Insurance Contracts* (see Chapter 38). However, the disclosure requirements of Section 18 apply to intangible assets arising from contracts in the scope of FRS 103.

What you need to know

- An intangible asset is defined as an identifiable non-monetary asset without physical substance.
- The essential characteristics of intangible assets are therefore that they are identifiable, lack physical substance, are controlled by the entity, and will give rise to future economic benefits for the entity.
- The recognition and measurement rules differ depending on whether an intangible asset is acquired separately, acquired as part of a business combination, or is internally generated by an entity.
- After initial recognition, intangible assets are subsequently measured using either the cost model, or the revaluation model.
- Intangible assets are amortised over a finite useful life. If an entity is unable to make a reliable estimate of the useful life of an intangible asset, the life must not exceed ten years.
- Section 18 specifies that certain costs must be expensed, including start-up costs, training costs, advertising and promotional costs (unless it meets the definition of inventories held for distribution at no or nominal consideration), and relocation and reorganisation costs.
- The accounting for goodwill is addressed in Section 19 *Business Combinations and Goodwill* (see Chapter 22), and the impairment of intangible assets is also outside the scope of Section 18 and is instead dealt with in Section 27 *Impairment of Assets* (see Chapter 29).

1 Introduction

Intangible assets represent a significant class of assets for a wide range of entities. The existence of a corporate identity or brand; intellectual property rights protecting an entity's knowledge, products and processes; or contractual and other rights to exploit both physical and intellectual resources can be as important to an entity's success as its physical asset base and infrastructure. The cost and uncertainty of outcomes associated with developing these types of assets from scratch contribute in part to the premiums paid by acquirers of businesses that already have these attributes. Accordingly, there has for some time been a strong link between accounting for intangible assets and accounting for business combinations.

Section 18 addresses the nature, recognition and measurement of intangible assets other than goodwill. It also sets out the disclosure requirements. The accounting for goodwill is addressed in Section 19 (see Chapter 22). Section 18 does not address the impairment of intangible assets, which is dealt with in Section 27 (see Chapter 29).

There were no major changes introduced by the Periodic Review 2024 to Section 18 (effective 1 January 2026). Certain minor changes and clarifications have been made to reflect amendments made to other sections of FRS 102 or to align FRS 102 more closely with IFRS. For example, guidance has been added to state that an entity uses its judgement to assess whether an asset that incorporates both intangible and tangible elements are within the scope of Section 17 *Property, Plant and Equipment* or Section 18 (see 3.1.2 below). [FRS 102.18.3B]. Guidance was also added to explain the need for judgement in determining whether the acquisition of an intangible asset is the acquisition of an asset or a group of assets, or a business combination (see 3.1 below). [FRS 102.18.3A].

Cloud computing arrangements, which are becoming increasingly common as an alternative to on-site software and computing infrastructure, are discussed at 4.2 below.

There are some differences between the accounting for intangible assets under Section 18 compared to IFRS (see 5 below). The key differences are discussed at 2 below.

2 Comparison between Section 18 and IFRS

2.1 Intangible assets acquired in a business combination

Entities applying FRS 102 are required to recognise fewer intangible assets acquired in a business combination separately from goodwill than under IFRS, although they may voluntarily adopt an accounting policy to separately recognise additional intangible assets in business combinations, provided that this policy is applied consistently to the relevant class of intangible assets.

Under FRS 102, entities must recognise intangible assets in business combinations separately from goodwill when all of the following three conditions are satisfied:

- (a) The recognition criteria in paragraph 4 of Section 18 of the standard are met (see 3.2 below).
 - (b) The intangible asset arises from contractual or other legal rights.
- And
- (c) The intangible asset is separable (i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged either individually or together with a related contract, asset or liability). [FRS 102.18.8].

This requirement is more restrictive than IAS 38 *Intangible Assets* which requires intangible assets to be recognised separately from goodwill where they are either separable or arise from contractual or other legal rights. [IAS 38.33]. However, entities applying FRS 102 can choose to adopt an accounting policy to recognise intangible assets separately from goodwill where the recognition criteria in paragraph 4 of Section 18 of the standard are met and only one of conditions (b) or (c) above is met, [FRS 102.18.8], resulting in an approach closer to that required by IAS 38. The requirements of FRS 102 in respect of intangible assets acquired in a business combination are discussed at 3.2.2.A below.

2.2 Indefinite lived intangible assets

Under FRS 102 all intangible assets are considered to have a finite life. [FRS 102.18.19]. If an entity cannot make a reliable estimate of the useful life of an intangible asset, the life must not exceed ten years. Section 18 explicitly states that an entity is expected to be unable to make a reliable estimate of the useful life of an intangible asset only 'in exceptional cases'. [FRS 102.18.20].

IAS 38 requires an intangible asset to be regarded as having an indefinite life when there is no foreseeable limit to the period over which the asset is expected to generate net cash inflows for the entity. [IAS 38.88]. Intangible assets with indefinite useful lives are not amortised. [IAS 38.107].

2.3 Development costs

Section 18 allows an entity to capitalise expenditure incurred in developing an intangible asset, provided certain criteria are met. [FRS 102.18.8H]. Alternatively, an entity may choose to expense development expenditure as incurred. The policy adopted must be applied consistently to all development projects. [FRS 102.18.8K].

IAS 38 does not allow an accounting policy choice as to whether development costs can be capitalised or expensed. An intangible asset arising from the development phase of a project must be capitalised if certain criteria (the same as those in Section 18) are met. [IAS 38.57].

2.4 Advertising and promotional activities

Under FRS 102, promotional stocks, such as catalogues and other promotional material may be recognised as an asset if they meet the definition of inventories held for distribution at no or nominal consideration (see Chapter 16 at 3.2.11). [FRS 102.18.8C].

IAS 38 does not allow entities to capitalise expenditure on advertising and promotional activities, including mail order catalogues. [IAS 38.69(c)].

2.5 Intangible assets acquired by way of government grant

Section 18 requires intangible assets acquired by way of a grant to be recorded at fair value at the date the grant is received or receivable. *[FRS 102.18.12]*.

IAS 38, in contrast, permits an accounting policy choice between recognising the intangible asset at fair value or at a nominal amount. *[IAS 38.44, IAS 20.23]*.

2.6 Disclosures

There are some differences between the disclosure requirements of Section 18 and IFRS. These are discussed at 5 below.

3 Requirements of Section 18 for intangible assets other than goodwill

3.1 Scope and definition

Section 18 applies to all intangible assets, other than the following:

- Goodwill (dealt with by Section 19). [FRS 102.18.1]. See Chapter 22.
- Intangible assets held for sale in the ordinary course of business (dealt with by Section 13 *Inventories* and assets arising from contracts with customers that are recognised in accordance with Section 23). [FRS 102.18.1]. See Chapter 16 and Chapter 25 respectively.
- Financial assets (dealt with by Section 11 *Basic Financial Instruments* and Section 12 *Other Financial Instruments Issues*). [FRS 102.18.3(a)]. See Chapters 11, 12, 13 and 14.
- Heritage assets (dealt with by Section 34 *Specialised Activities*). [FRS 102.18.3(b)]. See Chapter 36.
- Exploration for and evaluation of mineral resources, such as oil, natural gas and similar non-regenerative resources (dealt with by Section 34) and expenditure on the development and extraction of such resources. [FRS 102.18.3(c)]. See Chapter 36.

And

- Deferred acquisition costs and intangible assets arising from contracts in the scope of FRS 103. However, the disclosure requirements of Section 18 apply to intangible assets arising from contracts in the scope of FRS 103. [FRS 102.18.3(d)]. See Chapter 38.

FRS 102 defines an intangible asset as “an identifiable non-monetary asset without physical substance”. [FRS 102 Appendix I]. For the purposes of this section, an asset is a resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity. [FRS 102.18.4A]. The essential characteristics of intangible assets are therefore that they:

- Are identifiable (see 3.1.1 below)
- Lack physical substance (see 3.1.2 below)
- Are controlled by the entity (see 3.1.3 below)

And

- Will give rise to future economic benefits for the entity (see 3.1.4 below)

However, in order to determine whether an intangible asset that meets all of these criteria is required to be recognised, an entity must also consider whether it satisfies the applicable recognition criteria set out within Section 18. The principles for the recognition of intangible assets are discussed at 3.2 below.

An entity may also need to use its judgement to determine whether the acquisition of an intangible asset is the acquisition of an asset or a group of assets, or a business combination within the scope of Section 19 (see Chapter 22). The separate application of both sections is required in determining whether a specific transaction meets the definition of a business combination as defined in Section 19 and includes an intangible asset as defined in this section. [FRS 102.18.3A].

3.1.1 Identifiability

An asset is identifiable when it:

- (a) Is separable, i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, asset or liability.

Or

- (b) Arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations. [FRS 102 Appendix I].

Applying this definition means that assets arising from contractual rights alone may meet the definition of an intangible asset under FRS 102. One example of such an asset is a licence that, legally, is not transferable except by sale of the entity as a whole. However, preparers must not restrict their search for intangible assets to those embodied in contractual or other legal rights. Non-contractual rights may also meet the definition of an intangible asset if the right could be sold, transferred, licensed, rented or exchanged.

3.1.2 Lack of physical substance

The definition of an intangible asset requires that it lacks physical substance. However, some intangible assets may be contained in or on a physical substance. In determining whether an asset that incorporates both intangible and tangible elements is within the scope of Section 17 or this section, an entity uses judgement to assess which element is more significant. FRS 102 provides the following examples:

[FRS 102.18.3B]

- Software without which a machine could not operate is an integral part of the related hardware and it is treated as property, plant and equipment.
- The operating system of a computer or mobile device is normally integral to the computer or mobile device and is included in property, plant and equipment.
- Software which is not an integral part of the related hardware is treated as an intangible asset.

IAS 38 also provides guidance in relation to research and development activities which may be relevant to FRS 102 reporters in applying the judgement discussed above. Paragraph 5 of IAS 38 notes that research and development expenditure may result in an asset with physical substance (e.g., a prototype), but as the physical element is secondary to its intangible component, the related knowledge, it is treated as an intangible asset. [IAS 38.5].

The 'parts approach' in Section 17 requires an entity to account for significant components of an asset separately if they have significantly different patterns of consumption of economic benefits. [FRS 102.17.6]. This raises 'boundary' problems between Section 17 and Section 18 when software and similar expenditure is involved.

How we see it

Where Section 17 requires an entity to identify parts of an asset and account for them separately, the entity needs to evaluate whether any intangible-type part is integral to the larger asset or whether it is really a separate asset. The intangible part is more likely to be an asset if it was developed separately or if it can be used independently of the item of property, plant and equipment of which it apparently forms a part of.

3.1.3 Control

In the context of intangible assets, control normally results from legal rights, in the way that copyright, a restraint of trade agreement or a legal duty on employees to maintain confidentiality would protect the economic benefits arising from market and technical knowledge. While it will be more difficult to demonstrate control in the absence of legal rights, legal enforceability of a right is not a necessary condition for control. An entity may be able to control the future economic benefits in some other way, for example, through custody. However, determining that this is the case in the absence of observable contractual or other legal rights requires the exercise of judgement based on an understanding of the specific facts and circumstances involved.

For example, an entity usually has insufficient control over the future economic benefits arising from an assembled workforce (i.e., a team of skilled workers, or specific management or technical talent) or from training for these items to meet the definition of an intangible asset. There would have to be other legal rights before control could be demonstrated.

Similarly, an entity would not usually be able to recognise an asset for an assembled portfolio of customers or a market share. In the absence of legal rights to protect or other ways to control the relationships with customers or the loyalty of its customers, the entity usually has insufficient control over the expected economic benefits from these items to meet the definition of an intangible asset.

3.1.4 Future economic benefits

The future economic benefit of an asset is its potential to contribute, directly or indirectly, to the flow of cash and cash equivalents to the entity. Those cash flows may come from using the asset or from disposing of it.

Future economic benefits include not only future revenues from the sale of products or services but also cost savings or other benefits resulting from the use of the asset by the entity. For example, the use of intellectual property in a production process may create future economic benefits by reducing future production costs rather than increasing future revenues.

3.2 Recognition and initial measurement of an intangible asset

An item that meets the definition of an intangible asset (see 3.1 above) is recognised if and only if, certain recognition criteria are satisfied. These requirements are shown in the extract below.

Extract from Section 18

- 18.4** An entity shall recognise an intangible asset as an asset if, and only if:
- (a) it is probable that the expected future economic benefits that are attributable to the asset will flow to the entity; and
 - (b) the cost or value of the asset can be measured reliably. *[FRS 102.18.4]*

The term 'asset' is used in this section in a different way to that in paragraph 33 of section 2 of the standard and the Glossary. For the purposes of this section, an asset is a resource controlled by an entity as a result of past events and from which future economic benefits are expected to flow to the entity.

[FRS 102.18.4A].

'Probable' is defined as 'more likely than not'. *[FRS 102 Appendix I]*. In assessing whether expected future economic benefits are probable, the entity must use reasonable and supportable assumptions representing management's best estimate of the set of economic conditions that will exist over the useful life of the asset. *[FRS 102.18.5]*. In making the judgement over the degree of certainty attached to the flow of future economic benefits attributable to the use of the asset, the entity considers the evidence available at the time of initial recognition, giving greater weight to external evidence. *[FRS 102.18.6]*.

The test that the item meets both the definition of an intangible asset and the criteria for recognition is performed at the time of initial recognition of the expenditure. On initial recognition, any intangible asset meeting these criteria must be measured at cost. *[FRS 102.18.9]*. If these criteria are not met at the time the expenditure is incurred, an expense is recognised and it is never reinstated as an asset. *[FRS 102.18.17]*.

The guidance in Section 18 on the recognition and initial measurement of intangible assets takes account of the way in which an entity obtained the asset. Separate rules for recognition and initial measurement apply for intangible assets depending on whether they were:

- Acquired separately (see 3.2.1 below)
 - Acquired as part of a business combination (see 3.2.2 below)
 - Generated internally (see 3.2.3 below)
 - Acquired by way of government grant (see 3.2.4 below)
- Or
- Obtained in an exchange of assets (see 3.2.5 below)

3.2.1 Separately acquired intangible assets

3.2.1.A Recognition of separately acquired intangible assets

Separately acquired intangible rights will normally be recognised as assets, provided that they meet the definition of an intangible asset in Section 18.

The criteria for recognising an intangible asset are set out at 3.2 above. The probability recognition criterion in (a) at 3.2 above is always considered satisfied for intangible assets that are separately acquired. *[FRS 102.18.7]*. It is assumed that the price paid to acquire an intangible asset separately usually reflects expectations about the probability that the future economic benefits embodied in it will flow to the entity. In other words, the entity always expects there to be a flow of economic benefits, even if it is uncertain about the timing or amount. In addition, the cost of a separately acquired intangible asset can usually be measured reliably, as required in recognition criterion (b) at 3.2 above, especially in the case of a monetary purchase consideration.

However, not all external costs incurred to secure intangible rights automatically qualify for capitalisation as separately acquired assets, because they do not meet the definition of an intangible asset in the first place. An entity that subcontracts the development of intangible assets (e.g., development-and-supply contracts or R&D contracts) to other parties (its suppliers) must exercise judgement in determining whether it is acquiring an intangible asset or whether it is obtaining goods and services that are being used in the development of an intangible asset by the entity itself. For example, if the entity pays a supplier upfront or by milestone payments during the course of a project, it will not necessarily recognise an intangible asset on the basis of those payments. Only those costs that are incurred after it becomes probable that economic benefits are expected to flow to the entity will be part of the cost of an intangible asset. If a supplier is working on an internal project for the entity, costs can only be capitalised after the criteria have been met for recognising an internally developed intangible asset (see 3.2.3 below).

In determining whether a supplier is providing services to develop an internally generated intangible asset, it can be useful to consider the terms of the supply agreement, in particular whether the supplier is bearing a significant proportion of the risks associated with a failure of the project. For example, if the supplier is always compensated under a development-and-supply contract for development services and tool costs irrespective of the project's outcome, the entity on whose behalf the development is undertaken should account for those activities as its own.

3.2.1.B Initial measurement of separately acquired intangible assets

The standard sets out what comprises the cost of a separately acquired intangible asset as follows:

Extract from Section 18

- 18.10** The cost of a separately acquired intangible asset comprises:
- (a) its purchase price, including import duties and non-refundable purchase taxes, after deducting trade discounts and rebates; and
 - (b) any directly attributable cost of preparing the asset for its intended use. [FRS 102.18.10]

Section 18 does not elaborate on what costs may be directly attributable to preparing a separately acquired intangible asset for its intended use. However, based on the guidance included in paragraph 28 of IAS 38, examples may include:

- Costs of employee benefits arising directly from bringing the asset to its working condition.
- Professional fees arising directly from bringing the asset to its working condition.

And

- Costs of testing whether the asset is functioning properly.

Consistent with the requirements in paragraph 32 of IAS 38, capitalisation of expenditure must cease when the asset is in the condition necessary for it to be capable of operating in the manner intended by management. This may well be before the date on which it is brought into use.

3.2.1.C Variable and contingent consideration

The purchase price of an intangible asset (or component thereof) might include variable or contingent amounts. The final purchase price of the intangible asset is not known when the terms include a variable or contingent amount that is linked to future events that cannot be determined at the date of acquisition. The total consideration could vary based on the performance of an asset - for example, the revenue or EBITDA generated, for a specified future period, by the asset or a business in which the asset is used. Some arrangements can contain more than one source of variability.

Generally, where the payment of variable or contingent consideration is outside the control of both the buyer and the seller, we expect that the obligation to make the payment(s) would meet the definition of a financial liability, to be accounted for by applying Section 12 and shall be recognised when the intangible asset is purchased. [FRS 102.22.3A]. This means that any measurement changes to that liability would be recorded in the statement of profit or loss. However, in some instances contracts are more complex and it can be argued that the subsequent changes to the initial estimate of the purchase price should be capitalised as part of the cost of the asset. Further, many consider that these are executory payments that are not recognised until incurred.

How we see it

In the absence of specific guidance, an entity develops an accounting policy for variable consideration relating to the purchase of an intangible asset in accordance with the hierarchy in Section 10 *Accounting Policies, Estimates and Errors*. An entity must exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in its particular circumstances.

In practice, there are different approaches for treating the estimated future variable payments. Some entities do not capitalise these amounts upon initial recognition of the asset and then either expense or capitalise any payments as they are incurred. Other entities include an estimate of future amounts payable on initial recognition with a corresponding liability being recorded. Under this approach subsequent changes in the liability are either capitalised or expensed.

3.2.2 Intangible assets acquired as part of a business combination

3.2.2.A Recognition of intangible assets acquired as part of a business combination

An entity must use judgement to determine whether the acquisition of an intangible asset is the acquisition of an asset or a group of assets, or a business combination within the scope of Section 19. *[FRS 102.18.3A]*.

FRS 102 states:

Extract from Section 18

- 18.8** Intangible assets that are acquired in a business combination must be recognised separately from goodwill when all of the following three conditions are met:
- (a) the recognition criteria in paragraph 4 of Section 18 are met (see 3.2 above);
 - (b) the intangible asset arises from contractual or other legal rights; and
 - (c) the intangible asset is separable (i.e., capable of being separated or divided from the entity and sold, transferred, licenced, rented or exchanged either individually or together with a related contract, asset or liability). *[FRS 102.18.8]*

In addition, an entity can choose to recognise intangible assets separately from goodwill for which the recognition criteria in paragraph 4 of Section 18 of the standard are satisfied and only one of conditions (b) or (c) above is met. *[FRS 102.18.8]*.

Where an entity chooses to recognise such additional intangible assets, this policy must be applied to all intangible assets in the same class (i.e., having a similar nature, function or use in the business), and must be applied consistently to all business combinations. Section 18 adds that licences are an example of a category of intangible asset that may be treated as a separate class, however, further subdivision may be appropriate, for example, where different types of licences have different functions within the business. *[FRS 102.18.8]*. When this accounting policy choice is adopted, the acquirer is required to disclose the nature of those additional intangible assets and to explain why they have been separated from goodwill. *[FRS 102.18.28A]*.

If an intangible asset is acquired in a business combination, the cost of that intangible asset is its fair value at the acquisition date. *[FRS 102.18.11]*. As the fair value of an intangible asset must reflect expectations about the probability that the future economic benefits embodied in it will flow to the entity, the probability criterion is always assumed to be satisfied for intangible assets acquired as part of a business combination. In other words, the existence of a fair value means that an inflow of economic benefits is considered to be probable, in spite of any uncertainties about timing or amount.

The analysis of technical issues in Part B of the Basis for Conclusions provides examples of intangible assets that would normally satisfy all three criteria for separate recognition in a business combination. These include licences, copyrights, trademarks, internet domain names, patented technology and legally protected trade secrets. Examples of intangible assets that would not normally satisfy all three criteria include customer lists, customer relationships and unprotected trade secrets (such as recipes or formulae), as no contractual or legal right exists that would give rise to expected future economic benefits. *[FRS 102.BC.B18.10]*.

The separability criterion of Section 18 requires an acquired intangible asset to be 'capable' of being separated or divided from the acquiree. *[FRS 102.18.8(c)]*. This is regardless of the intentions of the acquirer. An intangible asset that is not individually separable from the acquiree or combined entity can still be recognised separately from goodwill if it could be separable in combination with a related contract, identifiable asset or liability. *[FRS 102.18.8(c)]*. For example, an acquiree owns a registered trademark and documented but unpatented technical expertise used to manufacture the trademarked product. The entity could not transfer ownership of the trademark without everything else necessary for the new owner to produce an identical product or service. Because the unpatented technical expertise must be transferred if the related trademark is sold, it is separable. In this example, the asset is separable but not contractual, such that the unpatented technical expertise would only be recognised separately from goodwill under FRS 102 where the acquirer applies a policy of recognising intangible assets separately from goodwill for which the recognition criteria in paragraph 4 of Section 18 of the standard are satisfied and only one of the conditions (b) or (c) above are met.

The process of identifying intangible assets in a business combination might involve, for example:

- Determining whether the entity has chosen to recognise additional intangible assets, or to restrict recognition only to those that meet all three recognition criteria noted above.
- Reviewing the list of items that the FRC believes would usually meet the recognition criteria for an intangible asset referred to above.
- Examining documents such as those related to the acquisition, other internal documents produced by the entity, public filings, press releases, analysts' reports, and other externally available documents.

And

- Comparing the acquired business to similar businesses and their intangible assets

Intangible assets differ considerably between industries and between individual entities. Therefore, considerable expertise and careful judgement is required in determining whether there are intangible assets that need to be recognised and valued separately.

3.2.2.B Initial measurement of intangible assets acquired as part of a business combination

The cost of an intangible asset acquired in a business combination is its fair value at the acquisition date. [FRS 102.18.11]. Section 18 provides no specific guidance on how to determine the fair value of intangible assets acquired in a business combination. Therefore, the requirements in Section 2A *Fair Value Measurement* must be applied. [FRS 102 Appendix I]. The requirements in Section 2A are discussed in Chapter 10, and specific recognition and initial measurement requirements for intangible assets acquired in a business combination are discussed further in Chapter 22 at 2.8.

3.2.3 Internally generated intangible assets

It may be difficult to decide whether an internally generated intangible asset qualifies for recognition because of problems in:

- (a) Confirming whether and when there is an identifiable asset that will generate expected future economic benefits.

And

- (b) Determining the cost of the asset reliably, especially in cases where the cost of generating an intangible asset internally cannot be distinguished from the cost of maintaining or enhancing the entity's internally generated goodwill or of running day-to-day operations.

To avoid the inappropriate recognition of an asset, Section 18 requires that internally generated intangible assets are not only tested against the general requirements for recognition and initial measurement (discussed at 3.1 above), but also meet criteria which confirm that the related activity or project is at a sufficiently advanced stage of development, is both technically and commercially viable and includes only directly attributable costs. Those criteria comprise guidance on accounting for intangible assets in the research phase (see 3.2.3.A below), the development phase (see 3.2.3.B below) and on measurement of an internally generated intangible asset (see 3.2.3.C below).

To assess whether an internally generated asset meets the criteria for recognition, an entity classifies the generation of the asset into a research phase and a development phase. [FRS 102.18.8A]. If an entity cannot distinguish the research phase from the development phase, then all expenditure is treated as research and is recognised as an expense when it is incurred. [FRS 102.18.8B].

3.2.3.A Research

Section 18 provides the following examples of research activities:

Extract from Section 18

18.8G Examples of research activities are:

- (a) Activities aimed at obtaining new knowledge.
- (b) The search for, evaluation and final selection of, applications of research findings and other knowledge.
- (c) The search for alternatives for materials, devices, products, processes, systems or services.
- (d) The formulation, design, evaluation and final selection of possible alternatives for new or improved material, devices, projects, processes, systems or services. [FRS 102.18.8G]

An entity cannot recognise an intangible asset arising from research or from the research phase of an internal project. Instead, any expenditure on research or the research phase of an internal project must be expensed as incurred. [FRS 102.18.8E]. In the research phase of an internal project, the entity cannot demonstrate that there is an intangible asset that will generate probable future economic benefits. [FRS 102.18.8F].

If an entity cannot distinguish the research phase from the development phase, it must treat the expenditure on that project as if it were incurred in the research phase only and recognise an expense accordingly. [FRS 102.18.8B].

3.2.3.B Development

Section 18 provides the following examples of development activities:

Extract from Section 18

18.8J Examples of development activities are:

- (a) The design, construction and testing of pre-production or pre-use prototypes and models.
- (b) The design of tools, jigs, moulds and dies involving new technology.
- (c) The design, construction and operation of a pilot plant that is not of a scale economically feasible for commercial production.
- (d) The design, construction and testing of a chosen alternative for new or improved materials, devices, products, processes, systems or services. [FRS 102.18.8J]

In the development phase of an internal project, an entity can, in some instances, identify an intangible asset and demonstrate that the asset will generate probable future economic benefits. This is because the development phase of a project is further advanced than the research phase. [FRS 102.18.8I].

Entities have an accounting policy choice of whether or not to capitalise qualifying development expenditure. Entities must either recognise an internally generated intangible asset arising from the development phase of a project (provided that specific recognition criteria are met, see below) or recognise the expenditure in profit or loss as incurred. Where an entity adopts a policy of capitalising expenditure in the development phase, the policy must be applied consistently to all expenditure that meets the recognition criteria set out in Section 18. Expenditure that does not meet the conditions for capitalisation must be expensed as incurred. [FRS 102.18.8K].

An intangible asset arising from development can be recognised if, and only if, the entity is able to demonstrate that all of the following criteria set out in the extract from the standard below have been met.

Extract from Section 18

18.8H An entity may recognise an intangible asset arising from development (or from the development phase of an internal project) if, and only if, an entity can demonstrate all of the following:

- (a) The technical feasibility of completing the intangible asset so that it will be available for use or sale.
- (b) Its intention to complete the intangible asset and use or sell it.
- (c) Its ability to use or sell the intangible asset.
- (d) How the intangible asset will generate probable future economic benefits. Among other things, the entity can demonstrate the existence of a market for the output of the intangible asset or the intangible asset itself or, if it is to be used internally, the usefulness of the intangible asset.
- (e) The availability of adequate technical, financial and other resources to complete the development and to use or sell the intangible asset.
- (f) Its ability to measure reliably the expenditure attributable to the intangible asset during its development. [FRS 102.18.8H]

It may be challenging to demonstrate each of the above conditions because:

- Condition (b) relies on management intent.
And
- Conditions (c), (e) and (f) are entity-specific, i.e., whether development expenditure meets any of these conditions depends both on the nature of the development activity itself and the financial position of the entity.

Evidence demonstrating the availability of resources to complete, use and sell the intangible asset may be available in the form of:

- A business plan showing the technical, financial and other resources needed and the entity's ability to secure those resources.
- A lender's indication of its willingness to fund the plan confirming the availability of external finance.
And
- Detailed project information demonstrating that an entity's costing systems can measure reliably the cost of generating an intangible asset internally, such as salary and other expenditure incurred in securing copyrights or licences or developing computer software.

In any case, an entity must maintain books and records in sufficient detail that allow it to prove whether it meets the conditions set out in (a) to (f) above. Certain types of products (e.g., pharmaceuticals, aircraft and electrical equipment) require regulatory approval before they can be sold. Regulatory approval is not one of the criteria for recognition and therefore entities are not prohibited from capitalising development costs in advance of approval. However, in some industries regulatory approval is vital to commercial success and its absence indicates significant uncertainty around the possible future economic benefits. This is the case in the pharmaceuticals industry, where it is rarely possible to determine whether a new drug will secure regulatory approval until it is actually granted. Accordingly, it is common practice in this industry for costs to be expensed until such approval is obtained.

3.2.3.C Measurement of internally generated intangible assets

The cost of an internally generated intangible asset is the sum of the expenditure incurred from the date when the intangible asset first meets the recognition criteria in Section 18 set out at 3.2 above and the conditions for capitalising development costs set out at 3.2.3.B above. [FRS 102.18.10A].

Costs incurred before these criteria are met are expensed and cannot be reinstated retrospectively. [FRS 102.18.17].

The cost of an internally generated intangible asset comprises all directly attributable costs necessary to create, produce, and prepare the asset to be capable of operating in the manner intended by management. Examples of directly attributable costs are: [FRS 102.18.10B]

- (a) Costs of materials and services used or consumed in generating the intangible asset
- (b) Costs of employee benefits arising from the generation of the intangible asset
- (c) Fees to register a legal right
And

- (d) Amortisation of patents and licences that are used to generate the intangible asset.

Borrowing costs eligible for capitalisation under Section 25 *Borrowing Costs* may be recognised as an element of the cost of an internally generated intangible asset, provided the entity adopts an accounting policy of capitalising eligible borrowing costs. See Chapter 27.

Paragraph 67 of IAS 38 specifically prohibits recognition of the following items as a component of cost because they are not directly attributable costs:

- (a) Selling, administrative and other general overhead expenditure unless this expenditure can be directly attributed to preparing the asset for use.
- (b) Identified inefficiencies and initial operating losses incurred before the asset achieves planned performance.
And
- (c) Expenditure on training staff to operate the asset.

These costs would also not be considered directly attributable costs eligible for recognition as part of the cost of an internally generated intangible asset under Section 18.

An example of indirect and other general overhead expenditure that may be considered directly attributable to preparing an asset for use would be the depreciation of a research and development facility and the associated overheads such as electricity or insurance, if this facility was used in the creation of internally generated intangible assets.

3.2.3.D Expenditure that does not qualify for recognition as an internally generated intangible asset

In some cases, expenditure is incurred that does not meet the criteria for recognition as part of an internally generated intangible asset, for example because there is no intangible asset that can be recognised in accordance with the criteria set out at 3.2.3.B above or because the costs cannot be distinguished from the cost of developing the business as a whole. Expenditure on the following items must be recognised as an expense and must not be recognised as intangible assets: *[FRS 102.18.8C]*

- (a) Internally generated brands, logos, publishing titles, customer lists and items similar in substance.
 - (b) Start-up activities (i.e., start-up costs), which include establishment costs such as legal and secretarial costs incurred in establishing a legal entity, expenditure to open a new facility or business (i.e., pre-opening costs) and expenditure for starting new operations or launching new products or processes (i.e., pre-operating costs).
 - (c) Training activities.
 - (d) Advertising and promotional activities (unless it meets the definition of inventories held for distribution at no or nominal consideration. See 3.2.3.E below).
 - (e) Relocating or reorganising part or all of an entity.
- And
- (f) Internally generated goodwill.

For these purposes no distinction is made between costs that are incurred directly by the entity and those that relate to services provided by third parties. However, Section 18 does not prevent an entity from recording a prepayment as an asset if it pays for the delivery of goods before obtaining a right to access those goods. Similarly, a prepayment can be recognised when payment is made before services are received. *[FRS 102.18.8D]*.

3.2.3.E Measurement of intangible assets: income from incidental operations while an asset is being developed

When an entity generates income while it is developing or constructing an asset, the question arises as to whether this income reduces the initial carrying value of the asset being developed or must be recognised in profit or loss. Section 18 is silent on this issue. For IFRS reporters, IAS 38 requires the entity to consider whether the activity giving rise to income is necessary to bring the asset to the condition necessary for it to be capable of operating in the manner intended by management, or not. Entities reporting under FRS 102 may consider applying a similar assessment using the GAAP hierarchy in Section 10. IAS 38 requires the income and related expenses of incidental operations (being those not necessary to develop the asset for its intended use) be recognised immediately in profit or loss and included in their respective classifications of income and expense. *[IAS 38.31]*.

Whilst IAS 38 is not explicit on the matter, it follows that when the activity is determined to be necessary to bring the intangible asset into its intended use, any income must be deducted from the cost of the asset. An example would be where income is generated from the sale of samples produced during the testing of a new process or from the sale of a production prototype. However, care must be taken to confirm whether the incidence of income indicates that the intangible asset is ready for its intended use, in which case capitalisation of costs would cease, income would be recognised in profit or loss and the related costs of the activity would include a measure of amortisation of the asset.

3.2.3.F Advertising and promotional expenditure

As set out at 3.2.3.D above, FRS 102 generally requires expenditure on advertising and promotional activities to be recognised as an expense as incurred. However, Section 18 gives an exception for advertising and promotional activities that meet the definition of inventories held for distribution at no or nominal consideration. *[FRS 102.18.8C(d)]*.

Items covered by this definition may include stocks of brochures and other marketing material. Advertising and promotional expenditure that meets the definition of inventories held for distribution at no or nominal consideration must be included within inventories. This is discussed further in Chapter 16 at 3.2.11.

3.2.4 Intangible assets acquired by way of a grant

An intangible asset may sometimes be acquired free of charge, or for nominal consideration, by way of a government grant. Governments frequently allocate airport-landing rights, licences to operate radio or television stations, emission rights, import licences or quotas, or rights to access other restricted resources.

Section 18 does not set out any separate recognition criteria for intangible assets acquired by way of a grant. The recognition criteria for government grants are set out in Section 24 *Government Grants* (see Chapter 26).

The cost of an intangible asset acquired by way of a grant is its fair value at the date the grant is received or receivable in accordance with Section 24 *Government Grants* in respect of government grants or, for public benefit entities, Section 34 (see Chapter 36) in respect of incoming resources from non-exchange transactions as appropriate. [FRS 102.18.12]. Some permits allocated by government, such as milk quotas, are freely traded and therefore have a readily ascertainable fair value. However, it may be difficult to reliably measure the fair value of every kind of permit allocated by government because they may have been allocated for nil consideration, may not be transferable and may only be bought and sold as part of a business. Despite this, FRS 102 does not permit entities to recognise intangible assets acquired by way of government grant at a nominal value.

3.2.5 Exchanges of assets

An entity might swap certain intangible assets that it does not require or is no longer allowed to use for those of a counterparty that has other surplus assets. For example, it is not uncommon for airlines and media groups to exchange landing slots and newspaper titles, respectively, to meet demands of competition authorities.

Section 18 requires intangible assets acquired in exchange for non-monetary assets, or a combination of monetary and non-monetary assets, to be measured at fair value unless: [FRS 102.18.13]

(a) The exchange transaction lacks commercial substance.

Or

(b) The fair value of neither the asset received, nor the asset given up is reliably measurable.

If the fair value of neither the asset received, nor the asset given up, can be measured reliably the acquired intangible asset is measured at the carrying amount of the asset given up. [FRS 102.18.13(b)].

The acquired intangible asset must also be measured at the carrying amount of the asset given up if the exchange transaction lacks commercial substance. This is because it would not be appropriate to recognise a gain or loss on a transaction that lacks commercial substance. FRS 102 provides no guidance to assist entities in assessing whether a transaction has commercial substance. Under IFRS, IAS 38 requires that an entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows are expected to change as a result of the transaction. [IAS 38.46]. A similar assessment may need to be made under Section 18. In some cases, the assessment may be clear without an entity having to perform detailed calculations.

3.3 Subsequent measurement

Section 18 permits an entity to choose between two alternative treatments for the subsequent measurement of intangible assets: [FRS 102.18.18]

- The cost model

Or

- The revaluation model

When the revaluation model is selected, it must be applied to all intangible assets in the same class of asset. If an intangible asset in a class of revalued intangible assets cannot be revalued because there is no active market for this asset, the asset is carried at its cost less any accumulated amortisation and impairment losses. [FRS 102.18.18]. A class of assets is a grouping of assets of a similar nature and use in an entity's operations. [FRS 102 Appendix I]. Examples of separate classes of intangible asset may include:

- (a) Brand names
- (b) Mastheads and publishing titles
- (c) Computer software
- (d) Licences and franchises

- (e) Copyrights, patents and other industrial property rights, service and operating rights
- (f) Recipes, formulae, models, designs and prototypes
- And
- (g) Intangible assets under development

3.3.1 Cost model for measurement of intangible assets

Under the cost model, an entity must measure its intangible assets at cost less accumulated amortisation and any accumulated impairment losses. *[FRS 102.18.18A]*. The rules on amortisation of intangible assets are discussed at 3.3.3 below and impairment is discussed at 3.3.5 below.

3.3.2 Revaluation model for measurement of intangible assets

The revaluation model is only available if there is an active market for the intangible asset. *[FRS 102.18.18B]*. This will only rarely be the case (see 3.3.2.A below). Accordingly, Section 18 does not allow fair value to be determined indirectly, for example by using the same valuation techniques applied to estimate the fair value of intangible assets acquired in a business combination.

After initial recognition an intangible asset must be carried at a revalued amount, which is its fair value at the date of the revaluation less any subsequent accumulated amortisation and subsequent accumulated impairment losses. *[FRS 102.18.18B]*. To prevent an entity from circumventing the recognition rules of Section 18, the revaluation model does not allow: *[FRS 102.18.18C]*

- The revaluation of intangible assets that have not previously been recognised as assets.

Or

- The initial recognition of intangible assets at amounts other than cost.

These rules are designed to prevent an entity from recognising at a 'revalued' amount an intangible asset that was never recorded because its costs were expensed as they did not, at the time, meet the recognition criteria. Section 18 does not permit recognition of past expenses as an intangible asset at a later date.

[FRS 102.18.17].

However, an entity is permitted to apply the revaluation model to the whole of an intangible asset even if only part of its cost was originally recognised as an asset because it did not meet the criteria for recognition until part of the way through the development process. *[FRS 102.18.18F]*.

Where the revaluation model is applied, assets in the same class must be revalued at the same time. To do otherwise would allow selective revaluation of assets and the reporting of a mixture of costs and values as at different dates within the same asset class.

3.3.2.A Revaluation is allowed only if there is an active market

An entity can only elect to apply the revaluation model if the fair value can be determined by reference to an active market for the intangible asset. *[FRS 102.18.18B]*. An active market is a market in which all the transactions for the asset or liabilities take place with sufficient frequency and volume to provide pricing information on an ongoing basis. *[FRS 102 Appendix I]*.

Few intangible assets will be eligible for revaluation as such an active market would be uncommon. By their very nature most intangible assets are unique or entity specific. Intangible assets such as brands, newspaper mastheads, music and film publishing rights, patents or trademarks are ineligible for revaluation because each such asset is unique. The existence of a previous sale and purchase transaction is not sufficient evidence for the market to be regarded as active because of the requirement in the definition for a sufficient frequency and volume of transactions to allow the provision of ongoing pricing information. In addition, if prices are not available to the public, this is evidence that an active market does not exist.

If an intangible asset in a class of revalued intangible assets cannot be revalued because there is no active market for that particular asset, the asset must be carried at its cost less any accumulated amortisation and impairment losses. *[FRS 102.18.18J]*.

If the fair value of a previously revalued intangible asset can no longer be determined by reference to an active market, the valuation is 'frozen' at the date of the last revaluation by reference to the active market. The carrying amount of the asset is reduced thereafter by subsequent accumulated amortisation and any subsequent accumulated impairment losses. *[FRS 102.18.18E]*.

3.3.2.B Frequency of revaluations

If there is an active market, Section 18 requires revaluation to be performed “with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using fair value at the end of the reporting period”. [FRS 102.18.18D]. Section 18 lets entities judge for themselves the frequency of revaluations depending on the volatility of the fair values of the underlying intangible assets. Significant and volatile movements in quoted prices may necessitate annual revaluation, whereas a less frequent update would be required for intangibles whose price is subject only to insignificant movements. Nevertheless, since an entity can only revalue assets for which a price is quoted in an active market, there is no impediment to updating that valuation at each reporting date. As noted at 3.3.2 above, where the revaluation model is applied, assets in the same class must be revalued at the same time.

3.3.2.C Accounting for gains and losses on revaluations

Increases in an intangible asset’s carrying amount as a result of a revaluation must be recognised in other comprehensive income and accumulated in equity, except to the extent that the revaluation reverses previous revaluation decreases of the same asset that were recognised in profit or loss. In this case, the increases must be recognised in profit or loss. [FRS 102.18.18G]. Conversely, decreases in an intangible asset’s carrying amount as a result of a revaluation must be recognised in other comprehensive income to the extent of any previous revaluation increases of the same asset that are accumulated in equity. Any excess revaluation loss must be recognised in profit or loss. [FRS 102.18.18H].

For UK entities, the Regulations require that revaluation surpluses, net of provisions for amortisation or impairment, must be shown in the balance sheet within a separate reserve (the revaluation reserve) and not within retained earnings. [1 Sch 35].

3.3.3 Amortisation of intangible assets

After initial recognition, Section 18 requires an entity to allocate the depreciable amount of an intangible asset on a systematic basis over its useful life. [FRS 102.18.21]. Depreciable amount is the cost, or other amount substituted for cost, of the intangible asset, less its residual value. [FRS 102 Appendix I]. The amortisation charge for each period depends on the useful life of the intangible asset, the amortisation method applied and the residual value of the intangible asset. These factors are discussed at 3.3.3.A, 3.3.3.B and 3.3.3.C below.

The amortisation charge for each period must be recognised in profit or loss, unless another section of FRS 102 requires the cost to be recognised as part of the cost of an asset. For example, the amortisation of an intangible asset must be included in the costs of inventories or property, plant and equipment.

[FRS 102.18.21].

Amortisation must be charged on all intangible assets. This requirement applies even to intangible assets measured under the revaluation model. For guidance on depreciation of revalued assets see Chapter 20 at 3.7.3.A.

3.3.3.A Assessing the useful life of an intangible asset

The useful life of an intangible asset is: [FRS 102 Appendix I]

(a) The period over which an asset is expected to be available for use by an entity.

Or

(b) The number of production or similar units expected to be obtained from the asset by an entity.

Thus, if appropriate, the useful life of an intangible asset is expressed as a number of production or similar units rather than a period of time.

For the purposes of FRS 102, all intangible assets including those under the revaluation model, must be considered to have a finite useful life. [FRS 102.18.19].

Where an intangible asset arises from contractual or other legal rights, its useful life is the shorter of:

- The period of the contractual or other legal rights.
- And
- The period over which the entity expects to use the asset. [FRS 102.18.19].

If the contractual or other legal rights can be renewed, the useful life of the intangible asset will include the renewal period only if there is evidence to support renewal by the entity without significant cost.

[FRS 102.18.19]. An entity needs to exercise judgement in assessing what it regards as a significant cost. The following factors that are set out in paragraph 96 of IAS 38 may indicate that an entity is able to renew the contractual or other legal rights without significant cost: [IAS 38.96]

- (a) There is evidence, possibly based on experience, that the contractual or other legal rights will be renewed. If renewal is contingent upon the consent of a third party, this includes evidence that the third party will give its consent.
- (b) There is evidence that any conditions necessary to obtain renewal will be satisfied.

And

- (c) The cost to the entity of renewal is not significant when compared with the future economic benefits expected to flow to the entity from renewal.

If there is no evidence to support renewal of the contractual or legal rights by the entity without significant cost, then the useful life of the intangible asset must not include the renewal period. In this case, the original asset's useful life ends at the contractual renewal date. If the rights are then renewed at the renewal date, we would expect the renewal cost to be treated as the cost to acquire a new intangible asset.

How we see it

In our view, a number of factors may be considered in estimating the useful life of an intangible asset, including:

- (a) The expected usage of the asset by the entity and whether the asset could be managed efficiently by another management team.
- (b) Typical product life cycles for the asset and public information on estimates of useful lives of similar assets that are used in a similar way.
- (c) Technical, technological, commercial or other types of obsolescence.
- (d) The stability of the industry in which the asset operates and changes in the market demand for the products or services output from the asset.
- (e) Expected actions by competitors or potential competitors.
- (f) The level of maintenance expenditure required to obtain the expected future economic benefits from the asset and the entity's ability and intention to reach such a level.
- (g) The period of control over the asset and legal or similar limits on the use of the asset, such as the expiry dates of related leases.

And

- (h) Whether the useful life of the asset is dependent on the useful life of other assets of the entity.

If an entity is unable to make a reliable estimate of the useful life of an intangible asset, the life must not exceed ten years. [FRS 102.18.20]. However, this must not be considered an automatic default. Entities must not underestimate the useful life of an intangible asset on the basis of this requirement. Similarly, it must not be used to justify a useful life of ten years for an intangible asset for which a shorter useful life may be appropriate. Section 18 states that an entity is only expected to be unable to make a reliable estimate of the useful life of an intangible asset 'in exceptional cases'. [FRS 102.18.20].

Where an intangible asset is acquired in a business combination, but the acquiring entity does not intend to use it to generate future cash flows, it is unlikely that it could have anything other than a finite useful life.

How we see it

In our view, where an intangible asset is acquired in a business combination, but the acquiring entity does not intend to use it to generate future cash flows, an entity would not recognise an immediate impairment loss on acquisition. However, the estimated useful life of the asset is likely to be relatively short.

3.3.3.B Amortisation method

An entity must choose an amortisation method that reflects the pattern in which it expects to consume the asset's future economic benefits. If the entity cannot determine that pattern reliably, it must use the straight-line method. [FRS 102.18.22]. A variety of amortisation methods may be used to depreciate an intangible asset on a systematic basis over its useful life. The straight-line method is the most common seen in practice. The unit of production method or reducing balance method are also sometimes seen. Whilst an amortisation method based on estimated total output (a unit of production method) may be appropriate, an amortisation method based on the pattern of expected revenues is not. This is because a revenue-based method reflects a pattern of generation of economic benefits from operating the business (of which the asset is a part), rather than the consumption of the economic benefits embodied in the asset itself. The difference is more obvious when unit prices are expected to increase over time.

In selecting an appropriate amortisation method for intangible assets acquired in a business combination, entities must ensure consistency with any assumptions that were used in determining the fair value of the asset. For example, a customer relationship asset may be valued by taking into account an assumed churn-rate that implies a higher level of customer relationships ending in the earlier periods following the business combination. These factors may indicate that a straight-line method of amortisation is not the most appropriate method to reflect the pattern of consumption of the economic benefits that the intangible asset provides, as the valuation assumed that benefit to be frontloaded.

Amortisation begins when the intangible asset is available for use, i.e., when it is in the location and condition necessary for it to be usable in the manner intended by management. Therefore, even if an entity is not using the asset, it must still be amortised if it is available for use. Amortisation will cease when the asset is derecognised (see 3.3.6 below). [FRS 102.18.22].

3.3.3.C Residual value

Section 18 requires entities to assume a residual value of zero for an intangible asset, unless there is a commitment by a third party to purchase the asset at the end of its useful life or there is an active market for the asset from which to determine its residual value and it is probable that such a market will exist at the end of the asset's useful life. [FRS 102.18.23].

Given the definition of 'active market' (see 3.3.2.A above) it seems unlikely that an entity will be able to prove that the residual value of an intangible asset is other than zero.

3.3.3.D Amortisation of intangible assets with a residual value

The Note on Legal Requirements to FRS 102 provides guidance on the amortisation of intangible assets which have a residual value. When an intangible asset has a residual value, it is the depreciable amount that is amortised. [FRS 102.A3.37A]. See 3.3.3 above. As noted at 3.3.3.C above, the FRC believes that it is uncommon for an intangible asset to have a residual value and FRS 102 requires an entity to assume that the residual value is zero unless there is a commitment by a third party to purchase the asset at the end of its useful life or there is an active market for the asset from which to determine its residual value and it is probable that such a market will exist at the end of the asset's useful life. [FRS 102.18.23].

However, in those cases where an intangible asset does have a residual value that is not zero, the amortisation of the depreciable amount of the asset over its useful economic life is a departure from the requirements of paragraph 22 of Schedule 1 to the Regulations (and its equivalents in Schedules 2 and 3 to the Regulations and to the LLP Regulations respectively) since the regulations require intangible assets to be written off over their useful economic lives. In those circumstances, the FRC states that entities must invoke a true and fair override and make the disclosures required by paragraph 10(2) of Schedule 1 to the Regulations for the use of a true and fair override. [FRS 102.A3.37A].

3.3.3.E Review of amortisation period and amortisation method

Factors such as a change in how an intangible asset is used, technological advancement, or changes in market prices may indicate that the residual value or useful life of an intangible asset has changed since the most recent annual reporting date. If such indicators are present, management must review previous estimates and, if current expectations differ, amend the residual value, amortisation method or useful life to reflect current expectations. [FRS 102.18.24].

Changes in residual value, amortisation method or useful life must be accounted for prospectively as a change in accounting estimate in accordance with Section 10 of FRS 102. [FRS 102.18.24].

If the residual value of an intangible asset increases to an amount greater than the asset's carrying amount, the asset's amortisation charge would be zero until its residual value decreases to an amount below the asset's carrying amount.

3.3.4 Subsequent expenditure

Entities may sometimes incur expenditure on an acquired intangible asset after its initial recognition or on an internally generated intangible asset after its completion.

Section 18 provides no separate rules on the recognition of subsequent expenditure on intangible assets. Instead, subsequent expenditure that meets the general recognition criteria for intangible assets, discussed at 3.2 above, may be recognised as an addition to an intangible asset. Paragraph 20 of IAS 38 notes that in practice, most subsequent expenditure on intangible assets will maintain the expected future economic benefits embodied in the existing intangible asset and will not satisfy the recognition criteria in IAS 38. In addition, this paragraph notes that it is often difficult to attribute subsequent expenditure directly to an individual intangible asset rather than to the whole business. The same challenges equally apply under Section 18 and therefore, only rarely would we expect subsequent expenditure to be recognised in the carrying amount of an asset.

3.3.5 Impairment losses

Entities must refer to the requirements of Section 27 to determine whether an intangible asset is impaired. [FRS 102.18.25]. See Chapter 29.

Section 27 requires entities to assess at each reporting date whether there is any indication that an intangible asset may be impaired. If there are indicators of impairment, the entity must estimate the recoverable amount of the intangible asset. [FRS 102.27.7]. Section 27 explains how the entity does this and when it recognises or reverses an impairment loss. [FRS 102.18.25].

If there are indicators that an intangible asset is impaired, this could indicate that the entity must review the remaining useful life, amortisation method or residual value of the intangible asset, even if no impairment loss is recognised for the asset. [FRS 102.27.10].

3.3.6 Retirements and disposals

An intangible asset must be derecognised on disposal or when no future economic benefits are expected from its use or disposal. [FRS 102.18.26].

The gain or loss on derecognition, being the difference between the net disposal proceeds and the carrying amount of the asset must be accounted for in profit or loss. [FRS 102.18.26]. This means that any revaluation surplus relating to the asset disposed of is transferred directly to retained earnings and not reflected in profit or loss.

3.4 Presentation and disclosure

The main requirements of Section 18 are set out below, but it may be necessary to refer also to the disclosure requirements of Section 27 in the event of an impairment of an intangible asset (see Chapter 29).

3.4.1 Presentation of intangible assets

Entities are required by Schedule 1 of the Regulations to present a separate heading for intangible assets on the face of the balance sheet. Intangible assets must be analysed into the following sub-headings, either on the face of the balance sheet, or within the notes to the accounts:

- Development costs
- Concessions, patents, licenses, trademarks and similar rights and assets
- Goodwill
- And
- Payments on account

However, company law permits all entities to adapt the subheadings set out above to suit the nature of the entity's business. [1 Sch 4(1)].

3.4.2 General disclosures

Section 18 requires certain disclosures to be presented by class of intangible assets.

The extract below, specifies the disclosures for each class of intangible assets identified.

Extract from Section 18

18.27 An entity shall disclose the following for each class of intangible assets:

- (a) the useful lives or the amortisation rates used and the reasons for choosing those periods;
- (b) the amortisation methods used;
- (c) the gross carrying amount and any accumulated amortisation (aggregated with accumulated impairment losses) at the beginning and end of the reporting period;
- (d) the line item(s) in the statement of comprehensive income (or in the income statement, if presented) in which any amortisation of intangible assets is included; and
- (e) a reconciliation of the carrying amount at the beginning and end of the reporting period showing separately:
 - (i) additions, indicating separately those from internal development and those acquired separately;
 - (ii) disposals;
 - (iii) acquisitions through business combinations;
 - (iv) revaluations;
 - (v) amortisation;
 - (vi) impairment losses recognised or reversed in profit or loss in accordance with Section 27 *Impairment of Assets*; and
 - (vii) other changes.
- (f) The reconciliation need not be presented for prior periods. *[FRS 102.18.27]*

In addition to the disclosures required above, any impairment of intangible assets is to be disclosed in accordance with Section 27. *[FRS 102.27.33(d)]*. The nature and effect of any change in useful life, amortisation method or residual value estimates must be disclosed. *[FRS 102.10.18]*.

Entities are also required to provide the information per the extract below, to the extent that it applies:

Extract from Section 18

18.28 An entity shall also disclose:

- (a) a description, the carrying amount and remaining amortisation period of any individual intangible asset that is material to the entity's financial statements;
 - (b) for intangible assets acquired by way of a grant and initially recognised at fair value (see paragraph 18.12):
 - (i) the fair value initially recognised for these assets; and
 - (ii) their carrying amounts.
 - (c) the existence and carrying amounts of intangible assets to which the entity has restricted title or that are pledged as security for liabilities; and
 - (d) the amount of contractual commitments for the acquisition of intangible assets.
- [FRS 102.18.28]*

3.4.3 Disclosure of research and development expenditure

Entities must disclose the aggregate amount of research and development expenditure recognised as an expense during the period (i.e., the amount of expenditure incurred internally on research and development that has not been capitalised as an intangible asset or as part of the cost of another asset that meets the recognition criteria of FRS 102). *[FRS 102.18.29]*.

Where an entity has elected to capitalise development costs, company law requires disclosure of:

[1 Sch 21(2)]

(a) The period over which the amount of the costs that were originally capitalised is being written off.

And

(b) The reasons for capitalising the development costs.

Unamortised development costs included as an asset in a company's accounts must be treated as a realised loss for the purpose of calculating a company's distributable profits. However, in special circumstances directors may be able to justify a decision that unamortised development costs included as an asset in a company's accounts must not be treated as a realised loss. In such cases, the circumstances relied upon by the directors in reaching this justification must be disclosed. [s844].

3.4.4 Additional disclosures when the revaluation model is applied

If intangible assets are accounted for at revalued amounts, an entity must disclose the following listed in the extract below:

Extract from Section 18

18.29A If intangible assets are accounted for at revalued amounts, an entity shall disclose the following:

- (a) the effective date of the revaluation;
- (b) whether an independent valuer was involved;
- (c) the methods and significant assumptions applied in estimating the assets' fair values; and
- (d) for each revalued class of intangible assets, the carrying amount that would have been recognised had the assets been carried under the cost model. [FRS 102.18.29A]

UK Company law requires the following additional disclosures:

- (a) The years in which the intangible assets were separately valued (so far as known to the directors) and the separate values. [1 Sch 52].
- (b) For intangible assets that have been revalued in the financial year, the names of the persons who valued them or particulars of their qualifications for doing so, and the basis of valuation used by them. [1 Sch 52]. However, as FRS 102 allows the use of the revaluation model only where fair value can be determined by reference to an active market, this company law requirement is likely to be of limited relevance to FRS 102 reporters.

And

- (c) Separate disclosure of the revaluation reserve on the company balance sheet. [1 Sch 35(2)].

3.4.5 Disclosures for additional intangible assets recognised as part of a business combination

When, as part of a business combination, an acquirer elects to recognise intangible assets separately from goodwill for which the recognition criteria in paragraph 4 of Section 18 are satisfied and only one of condition (b) or (c) above is met (see 3.2.2.A above), the nature of those additional intangible assets and the reason why they have been separated from goodwill must be disclosed. [FRS 102.18.28A].

4 Practical issues

4.1 Website costs

There is no specific guidance on the accounting for website development costs under FRS 102. Given their lack of physical substance, it is likely that these costs would be classified as intangible assets under FRS 102 (see 3.1.2 above). However, certain elements related to developing a website, such as web servers, do have physical substance. Entities may therefore have to exercise judgement in determining whether to apply Section 18 or Section 17 to the elements of a website with physical substance.

Website costs classified as intangible assets would be subject to the specific recognition requirements for internally generated intangible assets within Section 18.

4.2 Cloud computing arrangements

As the use of technology, data and connectivity expands, cloud computing arrangements are becoming more common. Cloud computing arrangements are arrangements in which the customer does not currently have possession of the underlying software used in the arrangement. Rather, the customer accesses and uses the software on an as-needed basis (e.g., through the internet, or via a dedicated line). Examples of cloud computing arrangements include software as a service, platform as a service, infrastructure as a service and other hosting arrangements. FRS 102 does not contain explicit guidance on a customer's accounting for cloud computing arrangements or the costs to implement them.

IFRS IC agenda decisions were issued in March 2019¹⁰² and March 2021¹⁰³ which provided additional guidance for IFRS reporters to apply when accounting for cloud computing arrangements. We do not expect an FRS 102 reporter to automatically refer to an IFRS IC agenda decision on all occasions. Instead, management should firstly assess whether there are any conflicts with the requirements of FRS 102 (including the definitions, recognition criteria, measurement concepts and pervasive principles in Section 2). If no conflict exists, management should consider whether the accounting policy adopted complies with the requirements of FRS 102 in the light of the guidance provided in the agenda decisions. This would include, if necessary, consideration of the hierarchy in the Section 10 of FRS 102, discussed in Chapter 9 at 3.1. Where the hierarchy is being applied to develop an accounting policy based on IFRS, a summary of the applicable guidance and how to apply it, can be found in our publication, *Applying IFRS: Accounting for cloud computing costs*.¹⁰⁴

4.3 Industry specific practical issues

Entities in certain industries may encounter issues in accounting for intangible assets that are common across the industry. Industry specific issues are not explicitly addressed by Section 18. Entities encountering the following industry specific issues may wish to consider guidance in the EY publication, International GAAP® in formulating appropriate accounting policies under FRS 102:

- Research and development in the pharmaceutical industry
- Agile software development
- Rate-regulated activities
- Emission trading schemes
- Accounting for green certificates or renewable energy certificates
- Accounting considerations for voluntary carbon credits
- Accounting for REACH costs
- Crypto-assets
- And
- Television and telecommunications programme and broadcast rights

¹⁰³ [IFRIC Update](#), March 2021, available on the IFRS Foundation's website (accessed on 2 October 2025)

¹⁰⁴ [Applying IFRS: Accounting for cloud computing costs](#) (accessed on 2 October 2025)

5 Summary of GAAP differences

The following table shows the differences between FRS 102 and IFRS.

	FRS 102	IFRS
Cost of separately acquired intangible assets	Comprises purchase price, import duties and non-refundable taxes, trade discounts and rebates; and directly attributable costs of preparing the asset for its intended use. See 3.2.1.B above	Similar to FRS 102, with additional guidance provided.
Intangible assets acquired in a business combination	Required only to recognise separately from goodwill those intangible assets that satisfy the general recognition criteria (see 3.2 above), and both of the following conditions are met: (a) The intangible asset arises from contractual or other legal rights. And (b) The intangible asset is separable. Entities can voluntarily adopt an accounting policy to recognise additional intangible assets of a particular class separately from goodwill where only one of conditions (a) or (b) are met. See 3.3.2.A above.	Must recognise separately from goodwill where the intangible asset meets the general recognition criteria in IAS 38 and either: (a) The intangible asset arises from contractual or other legal rights. Or (b) The intangible asset is separable (i.e., capable of being separated or divided from the entity and sold, transferred, licenced, rented or exchanged either individually or together with a related contract, asset or liability).
Intangible assets acquired by government grant	Cost of the asset is its fair value at the date the grant is received or receivable. See 3.2.4 above.	Accounting policy choice - measure at fair value or a nominal amount.
Advertising and promotional expenditure	Certain advertising and promotional expenditure must be carried as an asset within inventories. See 3.2.3.F above.	Expenditure on advertising and promotional activities is recognised as an expense when it is incurred.
Development expenditure	Accounting policy choice - an entity may recognise an intangible asset arising from development or from the development phase of an internal project if certain criteria are met. See 2.3 above.	An entity must recognise an intangible asset arising from development or from the development phase of an internal project if certain criteria (which are consistent with FRS 102) are met.
Amortisation	Intangible assets are amortised over a finite useful life. If an entity is unable to make a reliable estimate, the useful life must not exceed ten years.	Intangible assets with finite useful lives are amortised over their useful lives. An intangible asset with an indefinite useful life is not amortised.
	Renewal periods are included in the useful life of intangible assets that arise from contractual or legal right conveyed for a finite term only if	Consistent with FRS 102. Additionally, IAS 38 provides examples of indicators that an entity could renew

FRS 102		IFRS
	there is evidence to support renewal by the entity without significant cost.	the contractual or legal rights without significant cost.
	Review the amortisation method, useful life and residual value of intangible assets if there are indicators that any of these have changed. See 3.3.3 above.	Review the amortisation method, useful life and residual value of intangible assets at least at each financial year end.
Impairment reviews	Required if there are indicators of impairment. See 3.3.5 above.	Consistent with FRS 102 except impairment reviews required annually, and whenever indicators of impairment, for indefinite lived intangibles and intangible assets not yet available for use.
Intangible assets acquired in exchange for non-monetary assets	Measured at fair value unless the exchange transaction lacks commercial substance; or the fair value of neither the asset received nor the asset given up is reliably measurable. In that case, the asset's cost is measured at the carrying amount of the asset given up. See 3.2.5 above.	Similar to FRS 102. IAS 38 additionally provides guidance on determining whether a transaction has commercial substance.
Disclosures	The disclosures required by FRS 102 are set out at 3.4 above. The reconciliation table (i.e., opening balances to ending balances) is required only for current period.	Similar to FRS 102. IFRS requires a reconciliation of the carrying amount of intangible assets at the beginning and end of the reporting period for both the current and comparative period. In addition, there are some differences in the items to be included in the reconciliation table

Appendix A - Defined terms

Extracts from FRS 102

Appendix I Glossary

active market	A market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on ongoing basis.
amortisation	The systematic allocation of the depreciable amount of an asset over its useful life.
asset	A present economic resource controlled by the entity as a result of past events.
control	The power to govern the financial and operating policies of an entity so as to obtain benefits from its activities.
class of assets	A grouping of assets of a similar nature and use in an entity's operations.
depreciable amount	The cost of an asset, or other amount substituted for cost (in the financial statements), less its residual value.
development	The application of research findings or other knowledge to a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services before the start of commercial production or use.
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants. In the absence of any specific guidance provided in the relevant section of FRS 102, the guidance in Section 2A <i>Fair Value Measurement</i> shall be used in determining fair value.
identifiable	An asset is identifiable when: (a) it is separable, i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, asset or liability; or (b) it arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.
impairment loss	For assets other than inventories, the amount by which the carrying amount of an asset exceeds its recoverable amount.
intangible asset	An identifiable non-monetary asset without physical substance. Such an asset is identifiable when: (a) it is separable, i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, asset or liability; or (b) it arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.
inventories held for distribution at no or nominal consideration	Assets that are: (a) held for distribution at no or nominal consideration in the ordinary course of operations; (b) in the process of production for distribution at no or nominal consideration in the ordinary course of operations; or (c) in the form of material or supplies to be consumed in the production process or in the rendering of services at no or nominal consideration.

monetary items	Units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency.
non-exchange transaction	A transaction whereby an entity receives value from another entity without directly giving approximately equal value in exchange or gives value to another entity without directly receiving approximately equal value in exchange.
public benefit entity	An entity whose primary objective is to provide goods or services for the general public, community or social benefit and where equity is provided with a view to supporting the entity's primary objectives rather than with a view to providing a financial return to equity providers, shareholders or members.
research	Original and planned investigation undertaken with the prospect of gaining new scientific or technical knowledge and understanding.
residual value	The estimated amount that an entity would currently obtain from disposal of an asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.
useful life	The period over which an asset is expected to be available for use by an entity or the number of production or similar units expected to be obtained from the asset by an entity.

Chapter 22 Business combinations and goodwill

Contents

Overview	864
1 Introduction	865
2 Key differences between Section 19 and IFRS	866
2.1 Method of accounting	866
2.2 Definition of a business combination	866
2.3 Definition of a business	866
2.4 Identifying an acquirer	867
2.5 Cost of a business combination	867
2.5.1 Acquisition expenses	867
2.5.2 Contingent consideration	868
2.5.3 Contingent payments to employees or selling shareholders (and other transactions separate from the business combination)	868
2.6 Measurement period	868
2.7 Initial measurement of acquiree's assets, liabilities and contingent liabilities	869
2.8 Recognising intangible assets separately from goodwill	869
2.9 Deferred tax	870
2.10 Step acquisitions	870
2.11 Non-controlling interests in a business combination	871
2.12 Subsequent accounting for goodwill	871
2.13 Disclosures	871
3 Requirements of Section 19 for business combinations and goodwill	873
3.1 Scope of Section 19	873
3.1.1 Application of the purchase method	875
3.2 Identifying a business combination	875
3.2.1 Business combination defined	875
3.2.2 Inputs, processes and outputs	875
3.2.3 Differing combination structures	877
3.3 The purchase method (acquisition accounting)	877
3.3.1 Interaction with UK company law	878
3.4 Identifying an acquirer	878
3.4.1 Reverse acquisitions	879
3.4.2 Newly incorporated entities ('Newcos') formed to effect a business combination	879

3.5	Determining the acquisition date	881
3.6	Measuring the cost of the business combination	882
3.6.1	Costs directly attributable to the combination	883
3.6.2	Adjustments to the cost of a business combination contingent on future events ('Contingent consideration')	884
3.6.2.A	Contingent consideration to be settled by equity instruments	885
3.6.2.B	Distinguishing 'contingent consideration' from other arrangements	888
3.6.2.C	Contingent consideration relating to future services	889
3.6.3	Assessing what arrangements are included in the cost of the business combination	890
3.7	Allocating the cost of the business combination to the assets acquired and liabilities and contingent liabilities assumed	891
3.7.1	Recognition exceptions	891
3.7.1.A	Provisions and contingencies	891
3.7.2	Recognition and measurement exceptions	893
3.7.2.A	Deferred tax assets and liabilities	893
3.7.2.B	Employee benefit assets and liabilities	893
3.7.2.C	Share-based payment transactions	894
3.7.2.D	Leases in which the acquiree is the lessee	894

Overview

This chapter discusses the principles and requirements that an acquirer applies in accounting for a business combination under Section 19 *Business Combinations and Goodwill*, including the initial recognition and measurement requirements for non-controlling interest and goodwill. A business combination is defined as "...the bringing together of separate entities or businesses into one reporting entity". [FRS 102.19.3, FRS 102 Appendix I]

Section 19 also addresses group reconstructions (as defined) but scopes out the formation of a joint venture in the financial statements of the joint venture itself (which is discussed in Chapter 18 at 3.8 and Chapter 8 at 3.8), and the acquisition of an asset or a group of assets that does not constitute a business (see 3.1 below). In addition, Section 34 *Specialised Activities* addresses public benefit entity combinations (see Chapter 36).

What you need to know

- Section 19 requires an entity to determine whether a transaction or event is a business combination. Judgement may be required to determine whether the transaction or event is the acquisition of a business or a group of assets.
- A business combination (with limited exceptions) is accounted for by applying the purchase method. The exceptions are for group reconstructions meeting specified criteria and for public benefit entity combinations that are in substance a gift or that are a merger.
- The application of the purchase method involves identifying an acquirer; determining the acquisition date; measuring the cost of the business combination; allocating the cost of the business combination to the identifiable assets acquired, and liabilities and provisions for contingent liabilities assumed (by recognising these at acquisition-date fair values, with limited exceptions) and recognising and measuring any non-controlling interest in the acquiree; and recognising and measuring goodwill or negative goodwill.
- Goodwill is amortised on a systematic basis over a finite useful life in line with the principles of Section 18 *Intangible Assets other than Goodwill* and assessed for impairment in line with the principles of Section 27 *Impairment of Assets*.
- If negative goodwill is recognised, it is recognised on the face of the statement of financial position and an amount up to the fair value of the non-monetary assets acquired is recognised in profit or loss in the periods in which the non-monetary assets are recovered. Any negative goodwill in excess of the fair values of non-monetary assets acquired is released in profit and loss in the periods expected to benefit.
- If the assets acquired and liabilities assumed do not constitute a business, the transaction is to be accounted for as an acquisition of a group of assets (see 3.1 below).
- Section 19 also addresses the accounting for group reorganisations. It permits the use of the merger method of accounting for group reorganisations meeting specified criteria.

1 Introduction

Section 19 applies to the accounting for business combinations. A business combination is defined as “...the bringing together of separate entities or businesses into one reporting entity”. [FRS 102.19.3, FRS 102 Appendix I]. While this chapter is written primarily in the context of an entity becoming a subsidiary of another, the guidance also applies to individual financial statements in situations where an entity purchases (or combines with) an unincorporated business, for example, through the acquisition of the trade and net assets, including goodwill, of another entity.

Section 19 requires all business combinations (with limited exceptions) to be accounted for by applying the purchase method. The exceptions are for group reconstructions meeting specified criteria (see 5 below), and for public benefit entity combinations that are in substance a gift or that are a merger (dealt with by Section 34- see Chapter 36 at 6).

Section 19 provides guidance on the most common issues facing preparers in relation to the accounting for business combinations - namely, defining a business combination, identifying the acquirer, determining the acquisition date, measuring the cost of the business combination, and then allocating that cost to the acquirer's interest in the identifiable assets and liabilities (and provisions for contingent liabilities) of the acquiree. It also addresses the initial and subsequent accounting treatment of goodwill or any excess over cost of the acquirer's interest in the identifiable assets and liabilities of the acquiree (negative goodwill).

Section 19 also addresses the accounting for group reorganisations. It permits the use of the merger method of accounting for group reorganisations meeting specified criteria. Group reorganisations generally involve the restructuring of the relationships between companies in a group by, for example, setting up a new holding company, changing the direct ownership of a subsidiary within a group, or transferring businesses from one company to another. Most of these changes have no impact on the consolidated financial statements of the ultimate parent (provided there are no non-controlling interests affected), because they are purely internal and cannot affect the group when it is being portrayed as a single entity.

However, such transactions may impact the consolidated financial statements (if prepared) of a parent (at a lower level in the group) that did not previously control the subsidiaries or businesses transferred. Such transactions can also have a significant impact on the financial statements of the individual companies in the group. This chapter addresses only the accounting in individual financial statements for the transfer of a business from another group company. The accounting in individual financial statements for the transfer of an investment in subsidiary is addressed in Chapter 8 at 4.2 to 4.4.

Section 9 *Consolidated and Separate Financial Statements*, which is dealt with in Chapter 8 of this publication, addresses the preparation of consolidated financial statements by parents. Its focus is on matters such as when consolidated financial statements must be prepared, what entities are considered to be part of the group for the purposes of inclusion therein, and the mechanics of how such entities must be dealt with in the consolidated financial statements. It also deals with the accounting for the loss of control of subsidiaries, and increases/decreases of interests in existing subsidiaries of the group (with no loss of control). Section 9 specifically addresses the accounting in the consolidated financial statements where a reporting entity exchanges a business (or other non-monetary assets) for an interest in another entity that thereby becomes a subsidiary, jointly-controlled entity or associate of the reporting entity (see Chapter 8 at 3.8). [FRS 102.9.31, FRS 102.9.32].

2 Key differences between Section 19 and IFRS

2.1 Method of accounting

IFRS 3 *Business Combinations* requires all business combinations within its scope to be accounted for using the purchase method and excludes business combinations under common control, whereas FRS 102 specifically caters for group reconstructions (allowing group reconstructions meeting specified criteria to be accounted for using the merger method of accounting). Appendix B of IFRS 3, however, provides further guidance to determine when a business combination is regarded as a business combination under common control. What constitutes a 'business combination under common control' under IFRS 3, however, is different from what meets the definition of a 'group reconstruction' under FRS 102 (see 5.1 below). Additionally, IFRS 3 makes no special provisions for business combinations involving public benefit entities. Another difference is that the 'purchase method' required by FRS 102 is conceptually different from that in IFRS 3. FRS 102 is a 'cost-based' approach, whereby the cost of the business combination is allocated to the acquirer's interest in the identifiable assets acquired and liabilities (and provisions for contingent liabilities) assumed. In contrast, IFRS 3 adopts an approach whereby the various components of a business combination are measured at their acquisition-date fair values (albeit with a number of exceptions). This results in a number of the differences, which are identified below.

2.2 Definition of a business combination

The definition of a business combination in FRS 102 is "the bringing together of separate entities or businesses into one reporting entity". [FRS 102.19.3, FRS 102 Appendix I].

IFRS 3 defines a business combination as: "A transaction or other event in which an acquirer obtains control of one or more businesses". [IFRS 3 Appendix A]. It is notable that the Basis of Conclusions accompanying IFRS 3 identifies that the definition is intended to include all the types of transactions and other events initially included in the scope of the predecessor standard, IFRS 3 *Business Combinations* (as issued in 2004). [IFRS 3.BC11].

FRS 102's definition is identical to that in IFRS 3 *Business Combinations* (as issued in 2004), so it follows that there are not likely to be differences in practice as a result of the differing definitions of a 'business combination'. However, differences could arise as a result of the definition of a 'business' which are discussed below.

2.3 Definition of a business

Like FRS 102, IFRS 3 includes an explicit definition of what constitutes a business. However, by inclusion of the additional italicised words in the definition of a business - "An integrated set of activities and assets *that is capable of being* conducted and managed ..." (emphasis added) [IFRS 3 Appendix A] - IFRS 3's definition of a business is wider than that in FRS 102.

Additionally, FRS 102 indicates that a business generally consists of three different elements - (1) inputs, (2) processes applied to those inputs, and (3) resulting outputs which are, or will be, used to generate revenues. [FRS 102 Appendix I].

IFRS 3 further defines these elements and clarifies that a business would be required to have only the first two of these three elements (i.e., inputs and processes), which together have the ability to create outputs. Furthermore, a business does not need to include all the inputs and processes but, to be considered a business, an integrated set of activities and assets must include as a minimum an input and a substantive process that together significantly contribute to the ability to create output. [IFRS 3.B7, IFRS 3.B8]. As such, although businesses usually have outputs, under IFRS 3 they would not need to be present for an integrated set of activities and assets to be a business.

Furthermore, under IFRS 3, there is an optional 'concentration test' designed to simplify the evaluation of whether an integrated set of activities and assets constitutes a business. An integrated set of activities and assets is not a business if substantially all of the fair value of the gross assets acquired (excluding cash and cash equivalents, deferred tax assets and goodwill resulting from the effects of deferred tax liabilities) is concentrated in a single identifiable asset or group of similar identifiable assets. If this concentration test, which is optional on a transaction-by-transaction basis, is applied and the set of activities and assets is determined not to be a business, no further assessment is needed. [IFRS 3.B7-IFRS 3.B12D].

Consequently, there are scenarios in which the definition of a business differs between IFRS 3 and FRS 102. In addition, IFRS 3 contains application guidance on the definition of a business, which FRS 102 does not.

2.4 Identifying an acquirer

FRS 102 includes as an explicit step in applying the purchase method ‘identifying an acquirer’, [FRS 102.19.7(a)], and states that the acquirer is the combining entity that obtains control of the other combining entities or businesses. [FRS 102.19.8].

In identifying the acquirer, Section 19 in the first instance refers to the guidance in Section 9 (see 3.4 below and Chapter 8 at 3.2), and failing a clear indication from Section 9, sets out specific factors to consider in the Appendix to Section 19 *Guidance on identifying the acquirer*. [FRS 102.19.10, FRS 102.19A.1-FRS 102.19A.6].

IFRS 3 likewise explicitly requires that, for each business combination, one of the combining entities be identified as the acquirer, i.e., the entity that obtains control of another entity, the acquiree. [IFRS 3.6]. As for guidance on identifying that acquirer, IFRS 3 in the first instance similarly refers to the guidance in IFRS 10 *Consolidated Financial Statements*; and failing a clear indication from IFRS 10, sets out specific factors to be considered. [IFRS 3.6, IFRS 3.7, IFRS 3.B14-IFRS 3.B18].

The overriding requirement of both Section 19 and IFRS 3 is to determine which entity (if any) has control; however, the definition of control under Section 9 and IFRS 10 differs. The difference in the definition of control (and the related application guidance discussed below) means that there could be circumstances when an entity is controlled by a parent under FRS 102 and not controlled under IFRS 10 (and *vice versa*). Likely areas of difference include potential voting rights, where control is exercised through an agent, control of special purpose entities, interests held as trustee or fiduciary and *de facto* control. See Chapter 8 at 2.3.

Since the amendments to FRS 102 as part of the Periodic Review 2024, there is now a high degree of consistency between the guidance on identifying an acquirer contained in the Appendix to Section 19 of FRS 102 and in IFRS 3. However, differences in the guidance include:

- The application guidance in FRS 102 states that if a new entity is formed to issue equity instruments to effect a business combination it is likely that the acquirer is one of the pre-existing combining entities, whereas paragraph B18 of IFRS 3 states that one of the pre-existing combining entities “shall be identified as the acquirer” by applying the guidance in paragraphs B13 to B17 of IFRS 3. Both FRS 102 and IFRS 3 recognise that a new entity transferring cash or other assets or incurring liabilities could be the acquirer. [FRS 102.19A.5, IFRS 3.B18].
- The application guidance in FRS 102 states that an acquirer is usually the combining entity whose owners as a group retain or receive the largest portion of the voting rights in the combined entity. IFRS 3 has the same guidance but expands on this to say that an entity must consider the existence of any unusual or special voting arrangements and option, warrants or convertible securities. [FRS 102.19A.2(a), IFRS 3.B15(a)]. According to IFRS 10, potential voting rights are considered only if the rights are substantive. [IFRS 10.B47]. Although the application guidance in FRS 102 does not mention potential voting rights, paragraph 9.6 of FRS 102 states that control can be achieved by having currently exercisable options or convertible instruments. [FRS 102.9.6]. There may be a difference in what is deemed to be a ‘currently exercisable’ option under FRS 102 and a right that is deemed to be ‘substantive’ under IFRS 10.

And

- While FRS 102 acknowledges that an acquirer may be the entity whose equity instruments are acquired (the legal acquiree), also known as a ‘reverse acquisition’, IFRS 3 contains specific accounting guidance about reverse acquisition accounting and provides an example illustrating the accounting for a reverse acquisition. [FRS 102.19A.6, IFRS 3.B19-B27, IFRS 3.IE1-IE15].

2.5 Cost of a business combination

2.5.1 Acquisition expenses

The inclusion of directly attributable costs within the cost of a business combination (effectively reflecting them within goodwill) under FRS 102 differs significantly from IFRS 3, which requires that acquisition-related transaction costs are expensed. [FRS 102.19.11(b), IFRS 3.53].

2.5.2 Contingent consideration

FRS 102 requires recognition of any contingent consideration to be made at the acquisition date if the adjustment is “probable and can be measured reliably”. [FRS 102.19.12]. If the potential adjustment is not recognised at the acquisition date, but subsequently becomes probable and can be measured reliably, the additional consideration is treated as an adjustment to the cost of the combination. [FRS 102.19.13]. Similarly, if the future events that, at the acquisition date, were expected to occur do not occur, or the estimate needs to be revised, the cost of the business combination is adjusted accordingly. [FRS 102.19.13A]. Any subsequent adjustments in respect of contingent consideration will consequently be reflected in the carrying amount of goodwill.

In contrast, under IFRS 3, the acquisition-date fair value of any contingent consideration is recognised as part of the consideration transferred in acquiring the business - regardless of whether payment is probable or can be measured reliably. The obligation for the contingent consideration is classified as equity or a financial liability based on the definition of an equity instrument and a financial liability in IAS 32 *Financial Instruments: Presentation*. Contingent consideration that is classified as equity is not remeasured. [IFRS 3.58]. This contrasts with FRS 102, under which, we believe that contingent consideration classified as equity would be adjusted for the number of equity instruments issued but not changes to their fair value, i.e., the share price (see 3.6.2.A below).

Under IFRS 3, subsequent changes in the fair value of the contingent consideration classified as a financial liability are not accounted for as adjustments to the consideration transferred but are reflected in profit or loss - they therefore do not result in changes to goodwill as they would under FRS 102. [IFRS 3.58].

2.5.3 Contingent payments to employees or selling shareholders (and other transactions separate from the business combination)

FRS 102, along with IFRS 3, specifically identifies a transaction that remunerates employees or former owners of the acquiree for future services as not part of the cost of the business combination. [FRS 102.19.11B, IFRS 3.52(b)]. Therefore, where selling shareholders are also continuing employees, it is necessary to determine whether payments are made to them in their capacity as selling shareholders or as employees. Whether contingent payments are contingent consideration or separate transactions (e.g., remuneration) depends on the nature of the arrangements. Understanding the reasons, who initiated the arrangement and when the parties entered into it can be helpful in making the assessment. [FRS 102.19.11B, FRS 102.19.15, IFRS 3.50, IFRS 3.51, IFRS 3.B52]. FRS 102 makes clear that the substance of the arrangement must be considered when determining what is part of the cost of the business combination. [FRS 102.19.11B]. IFRS 3 contains more extensive application guidance to assist in the determination of whether arrangements for contingent payments to employees or selling shareholders are contingent consideration in the business combination or are separate transactions. [IFRS 3.B54, IFRS 3.B55]. Furthermore, IFRS 3 specifically states that: “A contingent consideration arrangement in which the payments are automatically forfeited if employment terminates is remuneration for post-combination services”. [IFRS 3.B55(a)]. FRS 102 does not contain such a requirement.

Both FRS 102 and IFRS 3 acknowledge that there may be arrangements that are not part of what the acquirer and the acquiree (or its former owners) exchanged in the business combination which need to be accounted for separately from the business combination. IFRS 3 explains that a transaction entered into by or on behalf of the acquirer or primarily for the benefit of the acquirer (or combined entity), is likely to be a separate transaction. IFRS 3 includes, as examples of separate transactions, a transaction that in effect settles pre-existing relationships between the acquirer and acquiree, a transaction that remunerates employees or former owners of the acquiree for future services (as discussed above), and a transaction that reimburses the acquiree or its former owners for paying the acquirer’s acquisition-related costs. IFRS 3 includes extensive application guidance on determining what is part of a business combination. [FRS 102.19.15, IFRS 3.51, IFRS 3.52, IFRS 3.B50-B62]. Further discussion on this can be found at 3.6.2.B, 3.6.2.C and 3.6.3 below.

2.6 Measurement period

Under FRS 102, provisional amounts in the first post-acquisition financial statements are to be finalised within twelve months after the acquisition date. If amendments are required to those provisional amounts, they are made retrospectively by restating comparatives, i.e., by accounting for them as if they were made at the acquisition date. Beyond twelve months after the acquisition date, retrospective adjustments to the initial accounting are recognised only to correct a material error in accordance with Section 10 *Accounting Policies, Estimates and Errors*. [FRS 102.19.19].

These FRS 102 provisions are broadly consistent with IFRS 3; one nuance being the measurement period afforded by IFRS 3 ends at the sooner of: (i) one year from the acquisition date; and (ii) when the acquirer receives the information it was seeking about the facts and circumstances that existed as of the acquisition date or learns that it cannot obtain more information. [IFRS 3.45]. This distinction may have little practical difference.

2.7 Initial measurement of acquiree's assets, liabilities and contingent liabilities

FRS 102 requires the acquiree's identifiable assets and liabilities and a provision for those contingent liabilities, that satisfy the recognition criteria, to be measured at their acquisition-date fair values (except for deferred tax, employee benefit arrangements and share-based payments, which are to be recognised and measured in accordance with the respective section of FRS 102). [FRS 102.19.14]. There is also specific recognition and measurement guidance on leases in which the acquiree is the lessee, provisions and contingencies and the recognition of intangibles (see 2.8 below for more detail on the recognition of intangibles). [FRS 102.19.15D, FRS 102.19.15E, FRS 102.19.15F, FRS 102.19.15G, FRS 102.19.19A].

IFRS 3 includes a similar requirement to measure the identifiable assets acquired and liabilities assumed at their acquisition-date fair values. [IFRS 3.18]. Consistent with FRS 102, there is specific recognition and/or measurement guidance for deferred tax, employee benefits, share-based payments, leases in which the acquiree is the lessee, and provisions and contingencies. [IFRS 3.21]. However, unlike FRS 102, IFRS 3 additionally includes specific guidance on the recognition and/or measurement of indemnification assets, [IFRS 3.27, IFRS 3.28], re-acquired rights, [IFRS 3.29], assets held for sale, [IFRS 3.31], insurance contracts, [IFRS 3.31A], and intangible assets (see 2.8 below). [IFRS 3.14, IFRS 3.B31, IFRS 3.B40].

Section 19 offers no guidance on how to derive the acquisition date fair values. FRS 102 Appendix I defines fair value as: "The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in Section 2A *Fair Value Measurement* shall be used in determining fair value". [FRS 102 Appendix I]. Fair value measurement under FRS 102 must be reliable, otherwise recognition of the identifiable asset, liability or provision for contingent liability is not permitted. [FRS 102.19.15].

For the purpose of IFRS 3, the definition of 'fair value' is that in IFRS 13 *Fair Value Measurement*, being "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date." [IFRS 13.9]. Where IFRS 3 requires assets and liabilities to be measured at fair value, the guidance in IFRS 13 would be applied. Unlike FRS 102, IFRS 3 only prohibits recognition of contingent liabilities on the grounds that the fair value cannot be measured with sufficient reliability. [IFRS 3.23]. In practice, the bar for determining that a fair value measurement is not reliably measurable is relatively high, but one area it does impact under FRS 102 is the recognition of intangible assets which is discussed in 2.8 below.

2.8 Recognising intangible assets separately from goodwill

Under FRS 102, an intangible asset acquired in a business combination is separately recognised if it:

- (a) Meets the recognition criteria (i.e., it is probable that the expected future economic benefits attributable to the asset will flow, and that the fair value of the intangible asset can be measured reliably).
 - (b) Arises from contractual or legal rights.
- And
- (c) Is separable (i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged either individually or together with a related contract, asset or liability).

In addition, an entity may choose to recognise additional intangible assets acquired in a business combination separately from goodwill for which (a) is satisfied and only one of (b) or (c) is met. However, where an entity chooses to recognise such additional intangible assets, this policy must be applied to all intangible assets in the same class (i.e., having a similar nature, function and use in the business) and consistently to all business combinations. [FRS 102.18.8]. See 3.7.3.A below.

IFRS 3, in contrast, requires identifiable intangible assets, i.e., those meeting either the separable or contractual-legal criterion (so either (b) or (c) above) to be recognised separately from goodwill. [IFRS 3.14, IFRS 3.B3, IFRS 3.B34]. In addition, the probability and the reliable measurement criterion is always considered to be satisfied for intangible assets in a business combination. [IAS 38.33]. Consequently, FRS 102 does not require intangible assets to be recognised separately in as many situations as IFRS, although entities applying FRS 102 do have a policy choice as to whether to recognise more intangible assets.

The Illustrative Examples accompanying IFRS 3 provide a large number of examples of identifiable intangible assets acquired in a business combination. [IFRS 3.IE16-IFRS 3.IE44].

In the Basis of Conclusions to FRS 102, the FRC has provided examples of intangible assets that would normally meet all three criteria (a) to (c) above, and those that would not. Customer relationships are given as an example of an intangible asset that would not normally satisfy all three criteria “as no contractual or legal right exists that would give rise to expected future economic benefits.” [FRS 102.BC.B18.10]. This is a potential area of difference from IFRS 3, which contains examples of customer relationships that are considered to meet the contractual-legal criterion. [IFRS 3.IE23-IE30]. However, the option under FRS 102 to recognise additional intangible assets satisfying (a) and either (b) or (c) of the criteria above could be used to mitigate any potential difference with IFRS 3 in this regard.

2.9 Deferred tax

FRS 102 requires that when the tax base (i.e., the amount that can be deducted for tax) of an asset (other than goodwill) that is recognised in a business combination is less (more) than the value at which it is recognised, a deferred tax liability (asset) is recognised for the additional tax that will be paid (avoided) in respect of that difference. Similarly, a deferred tax asset (liability) is recognised for the additional tax that will be avoided (paid) because of a difference between the value at which a liability is recognised and its tax base (i.e., the amount that will be assessed for tax). The amount attributed to goodwill is adjusted by the amount of deferred tax recognised. [FRS 102.29.11].

The treatment under FRS 102 in a business combination is largely consistent with the requirements of IAS 12 *Income Taxes*, except in relation to the recognition of deferred taxes on goodwill. Whilst IAS 12 explicitly prohibits the recognition of a deferred tax liability relating to the initial recognition of goodwill, [IAS 12.15(a)], Section 29 prohibits the recognition of both a deferred tax liability and a deferred tax asset on goodwill arising in a business combination. [FRS 102.29.11]. Accordingly, in the (albeit rare) situation where goodwill is tax deductible and the deductible amount exceeds the value recognised in the financial statements no asset would be recognised under FRS 102, whereas a deductible temporary difference may qualify for recognition as a deferred tax asset under IAS 12. See further discussion in Chapter 31 at 2.2.

2.10 Step acquisitions

Where a parent acquires control of a subsidiary following a series of transactions, the cost of the business combination is the aggregate of the fair values of the assets given, liabilities assumed, and equity instruments issued by the acquirer at the date of each transaction in the series, [FRS 102.19.11A]. The accounting for the business combination does not include the recycling of any amounts that were previously taken to other comprehensive income. The ‘normal’ rules on allocating the cost of the business combination to the acquisition-date fair value of the identifiable assets, liabilities and contingent liabilities apply. [FRS 102.19.14].

This approach differs to the requirements under IFRS 3, whereby the acquirer remeasures any previously held equity investment in the acquiree immediately before obtaining control at its acquisition-date fair value and recognises any resulting gain or loss in profit or loss or other comprehensive income, as appropriate. In addition, any change in the value of the acquirer’s equity interest in the acquiree recognised in other comprehensive income is reclassified on the same basis that would be required if the acquirer had directly disposed of the previously held equity investment. [IFRS 3.42]. The acquisition-date fair value of the previously held equity interest is included in the computation of goodwill or gain on bargain purchase recognised under IFRS 3. [IFRS 3.32, IFRS 3.34].

2.11 Non-controlling interests in a business combination

FRS 102 requires that, at the acquisition date, any non-controlling interest in the acquiree is stated at the non-controlling interest's share in the net amount of the identifiable assets, liabilities and contingent liabilities recognised and measured in accordance with Section 19. [FRS 102.9.13(d), FRS 102.19.14A].

This differs from IFRS 3 where, for those non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of liquidation, there is a choice of two methods in measuring non-controlling interests arising in a business combination:

- Option 1, to measure the non-controlling interest at its acquisition date fair value.
- Or
- Option 2, to measure the non-controlling interest at the present ownership instruments' proportionate share of the recognised value of net identifiable assets acquired.

All other non-controlling interests (for example, preference shares not entitled to a *pro rata* share of net assets upon liquidation, the equity component of convertible debt and other compound financial instruments, share warrants, etc.) are measured at their acquisition-date fair value (unless another measurement basis is required by IFRS). [IFRS 3.19]. FRS 102 is silent on the measurement of such components of non-controlling interests, the implication being they are valued at nil if they are not entitled to a present ownership interest.

2.12 Subsequent accounting for goodwill

FRS 102 requires goodwill acquired in a business combination to be recognised as an asset and amortised on a systematic basis over its useful life. FRS 102 mandates that goodwill must have a finite useful life, and further, if in exceptional circumstances the entity is unable to make a reliable estimate of the useful life of goodwill, the life must not exceed 10 years. [FRS 102.19.23].

This contrasts with IFRS 3, under which goodwill is not amortised, but instead subjected to (at least) annual impairment tests under IAS 36 *Impairment of Assets*. [IFRS 3.B63(a)]. FRS 102 requires, instead, a review for impairment indicators at each reporting date, with impairment tests performed only where indications of such impairment exist. [FRS 102.19.23, FRS 102.27.7].

Where negative goodwill arises, FRS 102 requires the acquirer to reassess the identification and measurement of the acquiree's identifiable assets, liabilities and contingent liabilities and the measurement of the cost of the combination. Having undertaken that reassessment, any negative goodwill remaining after that reassessment is required to be recognised and separately disclosed on the face of the statement of financial position on the acquisition date, immediately below goodwill, and followed by a subtotal of the net amount of goodwill and the negative goodwill. Subsequently, negative goodwill up to the fair value of non-monetary assets acquired is recognised in profit or loss in the periods in which the non-monetary assets are recovered. Any negative goodwill in excess of the fair value of non-monetary assets acquired is recognised in profit or loss in the periods expected to benefit. [FRS 102.19.24].

This treatment differs to IFRS 3 whereby any excess of the acquirer's interest in the net fair value of the acquiree's identifiable assets, liabilities and contingent liabilities over cost (i.e., negative goodwill) is recognised by the acquirer immediately in profit or loss. [IFRS 3.34].

2.13 Disclosures

The FRS 102 disclosure requirements set out in Section 19 are considerably less extensive than those under IFRS 3; for example, IFRS 3 requires specific disclosures in respect of the following areas that are not included in FRS 102: [IFRS 3.B64]

- A qualitative description of the factors that make up the goodwill recognised
- The acquisition-date fair value of each major class of consideration (FRS 102 asks for a description of the components of the cost of the combination, such as cash, equity instruments and debt instruments)
- Indemnification assets
- Acquired receivables
- The total amount of goodwill that is expected to be deductible for tax purposes
- Transactions recognised separately from the business combination, including acquisition-related costs
- Bargain purchases
- Non-controlling interests (valuation techniques used for each non-controlling interest measured at fair value - this option is not relevant under FRS 102)

- Business combinations achieved in stages
 - Revenue and profit of the combined entity as though the acquisition date of all business combinations had been at the beginning of the year (FRS 102 requires only revenue and profit or loss of the acquiree since the acquisition date)
 - Provisional amounts and measurement period adjustments (FRS 102 requires disclosure of the fact there are provisional amounts recognised and the impacted line items, whereas in addition to these, IFRS 3 requires the reasons why the initial accounting is incomplete, and the nature and amount of any measurement period adjustments recognised during the reporting period. *[IFRS 3.B67(a), FRS 102.19.25B]*. However, as any subsequent adjustments will be accounted for retrospectively by restating comparatives, we would expect disclosure in FRS 102 financial statements that such adjustments have been made, and the reasons). *[1 Sch 7, 6 Sch 1]*.
 - Adjustments to contingent consideration in subsequent periods *[IFRS 3.B67(b)]*
- And
- An explanation of significant gains or losses relating to the identifiable assets acquired and liabilities assumed in a business combination in the current or previous reporting period *[IFRS 3.B67(e)]*.

There is a requirement in FRS 102 to provide a qualitative description of the nature of intangible assets included in goodwill. *[FRS 102.19.25(fA)]*. This is similar in nature to the requirement in IFRS 3 above, which requires a qualitative description of the factors that make up goodwill. However, the FRS 102 requirement is more specific in actually referring to intangible assets included in goodwill.

FRS 102 also requires disclosure of the useful life of goodwill and, if in exceptional cases, this could not be reliably estimated, reasons for the period chosen in the period of acquisition and future periods. *[FRS 102.19.25(g), FRS 102.19.26B]*. Obviously, this requirement is not applicable under IFRS 3 as goodwill is not amortised. Similarly, not applicable under IFRS 3, is the requirement under FRS 102 to disclose the periods in which the excess recognised as negative goodwill is recognised in profit and loss and a reconciliation of the carrying amount of negative goodwill from the beginning of the reporting period to the end. *[FRS 102.19.25(h), FRS 102.19.26A]*.

For any contingent liabilities not recognised because the fair value cannot be measured reliably, paragraph B64(j)(ii) of IFRS 3 requires the reasons why the liability cannot be measured, to be disclosed. However, this requirement is not included under FRS 102. *[IFRS 3.B64(j)(ii)]*.

IFRS 3 requires disclosure of all of the requirements in paragraph B64 for business combinations effected after the end of the reporting period but before the financial statements are authorised for issue, unless the initial accounting is incomplete, in which case disclosure is required of this fact and the reasons why. *[IFRS 3.B66]*. Section 19 does not have any disclosure requirements for business combinations effected after the end of the accounting period; however non-adjusting event disclosures are specifically required for a major business combination or disposal of a major subsidiary. *[FRS 102.32.11]*. These are less onerous than the disclosure requirements under IFRS 3.

3 Requirements of Section 19 for business combinations and goodwill

A business combination is defined by FRS 102 as “...the bringing together of separate entities or businesses into one reporting entity”. [FRS 102.19.3, FRS 102 Appendix I]. This applies not only when an entity becomes a subsidiary of another, but also when an entity purchases (or combines with) an unincorporated business, for example, through the acquisition of the trade and net assets, including any goodwill, of another entity.

3.1 Scope of Section 19

Extract from FRS 102

Scope of this section

19.1 This section applies to business combinations.

19.2 This section does not apply to:

- (a) the formation of a joint venture, in the financial statements of the joint venture itself; or
- (b) the acquisition of an asset or a group of assets that does not constitute a business.

PBE

19.2A In addition, public benefit entities shall consider the requirements of Section 34 *Specialised Activities* in accounting for public benefit entity combinations.

[FRS 102.19.1, FRS 102.19.2, FRS 102.PBE19.2A]

The first exception above scopes out the requirements of Section 19 for the accounting for the formation of a joint venture in the financial statements of the joint venture itself. In such circumstances, in the financial statements of the newly formed joint venture, that entity would need to determine an appropriate accounting policy to account for the transaction.

If the formation of the joint venture has arisen as a result of the venturer exchanging a business, or other non-monetary asset, for an interest in another entity that becomes a jointly controlled entity of the venturer, the requirements of Section 9 apply to consolidated financial statements prepared by the venturer. As discussed in Chapter 18 at 3.8, these include the requirement to recognise goodwill as the difference between the fair value of the consideration given and the fair value of the reporting entity's share of the pre-transaction identifiable net assets of the other entity. [FRS 102.9.31(b)]. If the formation of the joint venture has not arisen as a result of the venturer exchanging a business, or other non-monetary asset, but the venturer has acquired an investment in a jointly-controlled entity, as discussed in Chapter 18 at 3.6.2, the initial recognition requirements of the equity method apply in terms of accounting for any difference between the cost of acquisition and the investor's share of the fair values of the net identifiable assets of the jointly-controlled entity. [FRS 102.14.8(c)].

The second exception is a truism in that Section 19 applies only to business combinations - if the group of assets is not a business, Section 19 does not apply, nor does it specify how to account for a group of assets. The initial recognition and measurement of the assets acquired will depend on the nature of the particular assets and the requirements of FRS 102 for such assets. Many assets, such as property, plant and equipment, investment property, intangible assets or inventories, are required to be measured initially at cost. Therefore, it will be necessary to make some apportionment of the overall cost of the group of assets to the individual assets.

How we see it

One possible approach to making such an allocation would be to apply the guidance in IFRS 3 for the acquisition of a group of assets that is not a business. In such cases, the acquirer must identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, intangible assets in Section 18) and liabilities assumed and allocate the cost of the group to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase.

There may be other approaches. However, whatever approach is used to allocate the overall cost to the individual assets or liabilities, no goodwill arises since goodwill (positive or negative) is recognised only in a business combination.

When applying the principles of IFRS 3, the IFRS IC noted the requirement of IFRS 3.2(b), as described above, and that other IFRS accounting standards include initial measurement requirements for particular assets and liabilities (e.g., IFRS 9 *Financial Instruments* for financial instruments).

The IFRS IC observed that if an entity initially considers that there might be a difference between the sum of individual fair values of the identifiable assets and liabilities and the transaction price, the entity first reviews the procedures it has used to determine those individual fair values to assess whether such a difference truly exists before allocating the transaction price. The IFRS IC then considered two possible ways of accounting for the acquisition of the group of assets.

Under the first approach an entity:

- Identifies the individual identifiable assets acquired and liabilities assumed that it recognises at the date of the acquisition.
- Determines the individual transaction price for each identifiable asset and liability by allocating the cost of the group based on the relative fair values of those assets and liabilities at the date of the acquisition.

And

- Then applies the initial measurement requirements in applicable standards to each identifiable asset acquired and liability assumed. The entity accounts for any difference between the amount at which the asset or liability is initially measured and its individual transaction price applying the relevant requirements.

Applying the second approach, for any identifiable asset or liability initially measured at an amount other than cost, an entity initially measures that asset or liability at the amount specified by the applicable standard. The entity deducts from the transaction price of the group the amounts allocated to the assets and liabilities initially measured at an amount other than cost, and then allocates the residual transaction price to the remaining identifiable assets and liabilities based on their relative fair values at the date of acquisition.

The IFRS IC concluded that a reasonable reading of the requirements in IFRS 3.2(b) on the acquisition of the group results in one of the two approaches outlined above (i.e., a policy choice) and that an entity would apply its reading of the requirements consistently to all acquisitions of a group of assets that does not constitute a business.¹⁰⁵

If material, disclosure of accounting policy information on acquisition of a group of assets that is not a business and significant judgement made in applying such accounting policy would be required by Section 8. [FRS 102.8.5, FRS 102.8.6].

It may be difficult to determine whether or not an acquired group of assets constitutes a business (see 3.2.1 below for the definition of a business and a business combination), and this decision can have a considerable impact on an entity's reported results and the presentation of its financial statements.

Accounting for a business combination differs considerably from accounting for an asset acquisition in a number of important respects:

- Goodwill (positive or negative) arises only on business combinations.
- Assets acquired and liabilities assumed are generally accounted for at fair value in a business combination, while they are assigned a carrying amount based on an allocation of the overall cost in an asset acquisition.
- Deferred tax assets and liabilities are recognised on the differences between the carrying amounts and tax base of assets (other than goodwill) and liabilities if the transaction is a business combination, but are not recognised if it is an asset acquisition, since a timing difference approach applies to asset acquisitions (see Chapter 31 at 6.6.5). However, tax losses could be recognised in both a business combination and an asset acquisition where the recognition criteria are met.
- Where the consideration is in the form of shares, Section 26 *Share-based Payment* does not apply to a business combination but will apply to an asset acquisition within the scope of Section 26.
- Another difference may arise where the transaction involves contingent consideration. While Section 19 provides guidance on the accounting for contingent consideration in the acquisition of a business (see 3.6.2 below), Section 17 *Property, Plant and Equipment* and Section 18 provide no clear guidance on accounting for contingent consideration in an asset acquisition (see Chapter 20 at 3.4.1.I and Chapter 21 at 3.2.1.C).

And

- Disclosures are more onerous for business combinations than for asset acquisitions.

¹⁰⁵ IFRIC Update, November 2017, available on the IFRS Foundation's website.

3.1.1 Application of the purchase method

Extract from FRS 102

Purchase method

- 19.6** All business combinations shall be accounted for by applying the purchase method, except for:
- (a) group reconstructions which may be accounted for by using the merger accounting method (see paragraphs 19.27 to 19.33); and
 - (b) public benefit entity combinations that are in substance a gift or that are a merger which shall be accounted for in accordance with Section 34.

[FRS 102.19.6]

The remainder of 3 below addresses the accounting for business combinations applying the purchase method, and 4 below addresses the related disclosures.

The definition of and accounting for a group reconstruction under FRS 102 is discussed at 5 below.

Public benefit entity combinations are discussed in Chapter 36. at 6.5.

3.2 Identifying a business combination

3.2.1 Business combination defined

Extract from FRS 102

Business combinations defined

- 19.3** A business combination is the bringing together of separate entities or businesses into one reporting entity. The result of nearly all business combinations is that one entity, the acquirer, obtains control of one or more other businesses, the acquiree. The acquisition date is the date on which the acquirer obtains control of the acquiree. [FRS 102.19.3].

Appendix I

business An integrated set of activities and assets conducted and managed for the purpose of providing:

- (a) a return to investors; or
- (b) lower costs or other economic benefits directly and proportionately to policyholders or participants.

A business generally consists of inputs, processes applied to those inputs, and resulting outputs that are, or will be, used to generate revenues. If goodwill is present in a transferred set of activities and assets, the transferred set shall be presumed to be a business.

[FRS 102.19.3, FRS 102 Appendix I]

3.2.2 Inputs, processes and outputs

FRS 102 does not discuss further the meaning or interaction of inputs, processes or outputs. However, the application guidance to IFRS 3 expands upon them as follows: [IFRS 3.B7]

- **Input:** Any economic resource that creates outputs, or has the ability to contribute to the creation of, outputs when one or more processes are applied to it. Examples of inputs given by IFRS 3 include non-current assets (including intangible assets or rights to use non-current assets), intellectual property, the ability to obtain access to necessary materials or rights and employees.
- **Process:** Any system, standard, protocol, convention or rule is a process if, when applied to an input or inputs, it either creates or has the ability to contribute to the creation of outputs. Examples of processes given by IFRS 3 include strategic management processes, operational processes and resource management processes. These processes typically are documented, but the intellectual capacity of an organised workforce having the necessary skills and experience following rules and conventions may provide the necessary processes that are capable of being applied to inputs to create outputs. Accounting, billing, payroll and other administrative systems typically are not processes used to create outputs so their presence or exclusion generally will not affect whether an acquired set of activities and assets is considered a business.

And

- **Output:** The result of inputs and processes applied to those inputs that provide goods or services to customers, generate investment income (such as dividends or interest) or generate other income from ordinary activities.

Although businesses generally have outputs, there may be situations where development stage entities qualify as businesses because the inputs and processes will be used to generate outputs, despite outputs not being present at the acquisition date.

As noted at 2.3 above, there are scenarios in which the definition of a business may differ between IFRS 3 and FRS 102.

As discussed at 3.1 above, the acquisition of a group of assets - notwithstanding that it may be held within a separate entity or entities - which do not constitute a business is excluded from the scope of Section 19. In some situations, there may be difficulties in determining whether or not an acquisition of a group of assets constitutes a business, and judgement will need to be exercised based on the particular circumstances.

The following are examples from extractive and real estate industries that illustrate the issues.

Illustration 3-1: Extractive industries - definition of a business (1)

E&P Co A (an oil and gas exploration and production company) acquires a mineral interest from E&P Co B, on which it intends to perform exploration activities to determine if reserves exist. The mineral interest is an unproven property and there have been no exploration activities performed on the property.

Inputs - mineral interest

Processes - none

Output - none

Conclusion

In this scenario, we do not believe E&P Co A acquired a business. While E&P Co A acquired an input (mineral interest), it did not acquire any processes and there were no outputs.

Illustration 3-2: Extractive industries - definition of a business (2)

E&P Co A acquires a property similar to that in Illustration 3-1 above, except that oil and gas production activities are in place and the acquired set also includes a Supervisory Control and Data Acquisition ('SCADA') system. A SCADA system is a control system used to monitor and manage industrial processes and infrastructure in real-time. It consists of physical equipment, including pumps, meters and other assets used to facilitate gathering, processing, storing, and transporting of oil and gas. The target's employees are not part of the transferred set. E&P Co A will take over the operations by using its own employees.

Inputs - oil and gas reserves and SCADA system

Processes - operational processes associated with oil and gas production embodied in the SCADA system

Output - revenues from oil and gas production

Conclusion

In this scenario, we generally consider that E&P Co A acquired a business. The acquired set has all three components of a business (inputs, processes and outputs) and is providing a return to its owners. Although the employees are not being transferred to the acquirer, E&P Co A is able to produce outputs by:

- Supplying the employees necessary to continue production
- And
- Integrating the business with its own operations while continuing to produce outputs

Illustration 3-3: Real estate - definition of a business (1)

Company A acquires land and a vacant building from Company B. No processes, other assets or employees (for example, leases and other contracts, maintenance or security personnel, or a leasing office) are acquired in the transaction.

Inputs - land and vacant building constructed on that land

Processes - none

Output - none

Conclusion

In this scenario, we do not believe Company A acquired a business. While Company A acquired inputs (land and a vacant building), it did not acquire any processes and there were no outputs.

Illustration 3-4: Real estate - definition of a business (2)

Company A acquires an operating hotel, the hotel's employees, the franchise agreement, inventory, a reservations system and all 'back office' operations.

Inputs - non-current assets, franchise agreement, inventory, a reservations system and employees

Processes - operational and resource management processes associated with operating the hotel

Output - revenues from operating the hotel

Conclusion

In this scenario, we generally consider Company A acquired a business. The acquired set has all three components of a business (inputs, processes and outputs) and is providing a return to its owners.

There is a rebuttable presumption that if goodwill arises on the acquisition, the acquisition is a business. [FRS 102 Appendix I]. If, for example, the total fair value of an acquired set of activities and assets is £15 million and the fair value of the net identifiable assets is only £10 million, the existence of value in excess of the fair value of identifiable assets (i.e., goodwill) creates a presumption that the acquired set is a business. However, care needs to be exercised to ensure that all of the identifiable net assets have been identified and measured appropriately.

The absence of goodwill does not lead to a presumption that the acquired activities and assets do not represent a business.

3.2.3 Differing combination structures

FRS 102 indicates that a business combination may be structured in a variety of ways for legal, taxation or other reasons. For example, it may involve: [FRS 102.19.4]

- The purchase by an entity of the equity of another entity
- The purchase of all the net assets of another entity
- The assumption of the liabilities of another entity

Or

- The purchase of some of the net assets of another entity that together form one or more businesses

The business combination may be transacted through the issue of equity instruments, the transfer of cash, cash equivalents or other assets, or a mixture of these. The transaction may be between the shareholders of the combining entities or between one entity and the shareholders of another entity. It may involve the establishment of a new entity to control the combining entities or net assets transferred, or the restructuring of one or more of the combining entities. [FRS 102.19.5]. Whatever the legal structure, if it is a 'business combination' then the requirements of Section 19 apply (unless it is specifically excluded).

As indicated above, a business combination may involve the purchase of the net assets, including any goodwill, of another entity rather than the purchase of the equity of the other entity. Such a combination does not result in a parent-subsidiary relationship. Nevertheless, the acquirer (even if it is a single entity), will account for such a business combination in its individual or separate financial statements and consequently in any consolidated financial statements.

3.3 The purchase method (acquisition accounting)

All business combinations (apart from those excluded from the scope of Section 19 - group reconstructions which may be accounted for by using the merger accounting method and certain public benefit entity combinations) are accounted for by applying the purchase method. [FRS 102.19.6]. The purchase method is commonly referred to as acquisition accounting.

The purchase method views a business combination from the perspective of the combining entity that is identified as the acquirer. The acquirer recognises the assets acquired and liabilities and contingent liabilities assumed, including those not previously recognised by the acquiree.

Applying the purchase method involves the following steps: [FRS 102.19.7]

- Identifying an acquirer (see 3.4 below)
- Determining the acquisition date (see 3.5 below)
- Measuring the cost of the business combination (see 3.6 below)
- Allocating, at the acquisition date, the cost of the business combination to the assets acquired and liabilities and provisions for contingent liabilities assumed (see 3.7 below)

- Recognising and measuring any non-controlling interest (see 3.8 below)
- And
- Recognising and measuring goodwill (see 3.9 below)

3.3.1 Interaction with UK company law

The purchase method as outlined in Section 19 corresponds with the description of the acquisition method in UK company law: [6 Sch 9]

- The identifiable assets and liabilities of the undertaking acquired must be included in the consolidated balance sheet at their fair values as at the date of acquisition.
 - The income and expenditure of the undertaking acquired must be brought into the group accounts only as from the date of the acquisition.
 - There must be set off against the acquisition cost of the interest in the shares of the undertaking held by the parent company and its subsidiary undertakings the interest of the parent company and its subsidiary undertakings in the adjusted capital and reserves of the undertaking acquired.
 - The resulting amount if positive must be treated as goodwill, and if negative as a negative consolidation difference.
- And
- Negative goodwill may be transferred to the consolidated profit and loss account where such a treatment is in accordance with the principles and rules of Part 2 of Schedule 1 to the Regulations.

The accounting for goodwill (positive or negative) under Section 19 is discussed at 3.9 below.

3.4 Identifying an acquirer

Section 19 requires an acquirer to be identified for all business combinations accounted for by applying the purchase method. The acquirer is the combining entity that obtains control of the other combining entities or businesses. [FRS 102.19.8].

Control is defined as "...the power to govern the financial and operating policies of an entity or business so as to obtain benefits from its activities". [FRS 102.19.9]. Section 19 cross-refers to Section 9 for a description of control of one entity by another in the context of identifying subsidiaries for the purposes of consolidation.

Extract from FRS 102

Requirement to present consolidated financial statements

- 9.5** Control is presumed to exist when the parent owns, directly or indirectly through subsidiaries, more than half of the voting power of an entity. That presumption may be overcome in exceptional circumstances if it can be clearly demonstrated that such ownership does not constitute control. Control also exists when the parent owns half or less of the voting power of an entity but it has:
- (a) power over more than half of the voting rights by virtue of an agreement with other investors;
 - (b) power to govern the financial and operating policies of the entity under a statute or an agreement;
 - (c) power to appoint or remove the majority of the members of the board of directors or equivalent governing body and control of the entity is by that board or body; or
 - (d) power to cast the majority of votes at meetings of the board of directors or equivalent governing body and control of the entity is by that board or body.
- 9.6** Control can also be achieved by having options or convertible instruments that are currently exercisable or by having an agent with the ability to direct the activities for the benefit of the controlling entity.
- 9.6A** Control can also exist when the parent has the power to exercise, or actually exercises, dominant influence or control over the undertaking or it and the undertaking are managed on a unified basis.

[FRS 102.9.5, FRS 102.9.6, FRS 102.9.6A]

The requirements of Section 9 relating to 'control' are discussed in Chapter 8 at 3.2.

Section 19 notes that if, after applying the requirements of control in Section 9 it is not clear which of the combining entities is the acquirer, then the following factors must be considered: *[FRS 102.19.10]*

- If the business combination is effected primarily through a transfer of cash or other assets or by assuming or incurring liabilities, the entity that transfers the cash or other assets or assumes or incurs the liabilities is usually the acquirer. *[FRS 102.19A.1].*
- If the business combination is effected primarily through exchanging equity instruments, the entity that issues its equity instruments is usually the acquirer. Other pertinent facts and circumstances must also be considered. For example, the acquirer is usually the combining entity: *[FRS 102.19A.2].*
- Whose owners as a group retain or receive the largest portion of voting rights in the combined entity.
 - Whose single owner or organised group of owners hold the largest minority voting interest in the combined entity, if no other owner or organised group of owners has a significant voting interest.
 - Whose owners have the ability to elect or appoint or remove a majority of the members of the governing body of the combined entity.
 - Whose former management dominates the senior management of the combined entity.
- Or
- That pays a premium over the pre-combination fair value of the equity instruments of the other combining entity (or entities).
- The combining entity whose relative size is significantly greater than the other combining entity (or entities) is usually the acquirer. Examples of what can be used to measure size include assets, revenues or profit. *[FRS 102.19A.3].*
- If a business combination involves more than two entities, consideration must be given, among other things, to which of the combining entities initiated the combination as well as the relative size of the combining entities in determining the acquirer. *[FRS 102.19A.4].*

Section 19 is clear that a new entity formed to effect a business combination is not necessarily the acquirer. *[FRS 102.19A.5].* This is discussed in more detail at 3.4.2 below.

Determination of the acquirer may require significant judgement and consideration of the pertinent facts and circumstances is needed. In some cases, application of the above guidance can lead to the legal acquiree being identified as the acquirer for accounting purposes. *[FRS 102.19A.6].* See 3.4.1 below.

3.4.1 Reverse acquisitions

It is recognised that in some business combinations, commonly referred to as reverse acquisitions, the acquirer is the entity whose equity interests have been acquired (the legal acquiree/subsidiary) and the issuing entity is the acquiree. *[FRS 102.19A.6].* The legal subsidiary is the acquirer if it has the power to govern the financial and operating policies of the legal parent so as to obtain benefits from its activities. See 3.10 below for further discussion on reverse acquisitions.

3.4.2 Newly incorporated entities ('Newcos') formed to effect a business combination

Occasionally, a new entity is formed to issue equity instruments to effect a business combination between, for example, two other entities. If this is the case, the new entity formed is not necessarily the acquirer. It is likely that the acquirer is one of the combining entities that existed before the business combination. *[FRS 102.19A.5].* This is because the substance of the transaction is that one of the two other entities has acquired the other, but they have been brought together legally under the new entity rather than one of these entities acquiring the other. The new entity, itself, has little substance other than as a vehicle to hold the shares in the combining entities, and may have been structured in this way for legal, taxation or other reasons. Therefore, in such a transaction, the combination between the new entity and the identified acquirer is effectively the same as if a new entity had been inserted above an existing entity. Such a 'group reconstruction' would be accounted for under merger accounting (see 5.3 below). Reverse acquisition accounting (see 3.4.1 above and 3.10 below) is unlikely to be appropriate in this situation because the definition of a business combination (see 3.2.1 above) generally involves an acquirer obtaining control of a business, *[FRS 102.19.3]*, and a newly formed entity would not meet the definition of a business.

However, that is not to say that a new entity that is established to effect a business combination cannot ever be identified as the acquirer. A new entity that transfers cash, cash equivalents or other assets or assumes or incurs liabilities as consideration may be the acquirer. [FRS 102.19A.5]. For example, there may be situations where a new entity is established and used on behalf of a group of investors or another entity to acquire a controlling interest in a 'target entity' in an arm's length transaction and the consideration is cash or other assets. But there will be other situations where a new entity that transfers cash, cash equivalents or other assets or assumes or incurs liabilities as consideration is not the acquirer.

Illustration 3-5: Business combination effected by a Newco for cash consideration

Entity A intends to acquire the voting shares (and therefore obtain control) of Target Entity. Entity A incorporates Newco and uses this entity to effect the business combination. Entity A provides a loan at commercial interest rates to Newco. The loan funds are used by Newco to acquire 100% of the voting shares of Target Entity in an arm's length transaction. The group structure post-transaction is as follows:

Newco is required to prepare consolidated financial statements for the Holding Group (the reporting entity). In most situations like this, Newco would be exempt from preparing consolidated financial statements - see Chapter 8 at 3.1.

The acquirer is the entity that obtains control of the acquiree.

In this situation, Entity A has obtained control of Target Entity in an arm's length transaction, using Newco to effect the acquisition. The transaction has resulted in a change in control of Target Entity and Newco is in effect an extension of Entity A acting at its direction to obtain control for Entity A. Accordingly, Newco would be identified as the acquirer at the Holding Group level.

It is not appropriate to conclude that Target Entity must be the acquirer and argue that Newco does not have any substance to it, as this ignores the fact that there is a third party involved and that this party is, in substance, the ultimate controlling party in the transaction.

If rather than Entity A establishing Newco, a group of investors had established it as the acquiring vehicle through which they obtained control of Target Entity then, we believe, Newco would be regarded as the acquirer since it is an extension of the group of investors.

Another specific situation in which a Newco might be identified as the acquirer is illustrated in Illustration 3-6 below, where a parent uses a Newco to facilitate a public flotation of shares in a group of subsidiary companies. In this particular situation, the critical distinguishing factor is that the acquisition of the subsidiaries was conditional on an IPO of Newco. This means that there has been a substantial change in the ownership of the subsidiaries by virtue of the IPO and indicates that the purpose and design of the transaction is to achieve a change in control over the transferred business.

How we see it

Whether a Newco formed to facilitate an IPO is capable of being identified as an acquirer depends on the facts and circumstances and ultimately requires judgement. If, for example, Entity A incorporates Newco and arranges for it to acquire Sub 1 and Sub 2 prior to the IPO proceeding, Newco could be viewed as an extension of Entity A or possibly an extension of Sub 1 or Sub 2. This is because the IPO and the reorganisation are not always seen as being part of one integral transaction, and therefore the transaction would be a combination of entities under common control. In that situation, Newco would not be the acquirer.

Illustration 3-6: Business combination effected by a Newco for cash consideration (spin-off transaction)

Entity A proposes to spin off two of its existing businesses (currently housed in two separate entities, Sub 1 and Sub 2) as part of an IPO. The existing group structure is as follows:

To facilitate the spin off, Entity A incorporates a new company (Newco) with nominal equity and appoints independent directors to the Board of Newco.

Newco signs an agreement to acquire Sub 1 and Sub 2 from Entity A conditional on the IPO proceeding. Newco issues a prospectus offering to issue shares for cash to provide Newco with funds to acquire Sub 1 and Sub 2. The IPO proceeds and Newco acquires Sub 1 and Sub 2 for cash. Entity A's nominal equity leaves virtually 100% ownership in Newco with the new investors.

Following the IPO, the respective group structures of Entity A and Newco appear as follows:

In this case, it would likely be appropriate to identify Newco as the acquirer. The Newco investors have obtained control and virtually 100% ownership of Sub 1 and Sub 2 in an arm's length transaction, using Newco to effect the acquisition. The transaction has resulted in a change in control of Sub 1 and Sub 2 (i.e., Entity A losing control and Newco investors, via Newco, obtaining control). Newco could in effect be considered as an extension of the Newco investors since:

- The acquisition of Sub 1 and Sub 2 was conditional on the IPO proceeding so that the IPO is an integral part of the transaction as a whole, evidencing that Newco is an extension of new investors to acquire control of Sub 1 and Sub 2.
- And
- There is a substantial change in the ownership of Sub 1 and Sub 2 by virtue of the IPO (i.e., Entity A only retains a negligible ownership interest in Newco).

Accordingly, Newco might be identified as the acquirer at the Holding Group level.

3.5 Determining the acquisition date

The determination of the acquisition date (i.e., the date on which the acquirer contains control of the acquiree), [FRS 102 Appendix 1], is critical to accounting for a business combination, as it is both the date from which the results of the acquiree are incorporated into the financial statements of the acquirer, and the date on which the cost of the business combination is allocated to the fair values of the assets acquired and liabilities and provisions for contingent liabilities assumed. The acquisition date is the date on which the acquirer obtains control of the acquiree. [FRS 102.19.3, FRS 102.19.10A].

Because control is the power to govern the financial and operating policies of an entity or business so as to obtain benefits from its activities, it is not necessary for a transaction to be closed or finalised at law before the acquirer obtains control. All pertinent facts and circumstances surrounding a business combination need to be considered in assessing when the acquirer has obtained control. [FRS 102.19.10A].

No further guidance is given in FRS 102 as to how to determine the acquisition date, but it is clearly a matter of fact. It cannot be artificially backdated or otherwise altered, for example, by the inclusion of terms in the agreement indicating that acquisition is to be effective as of an earlier date, with the acquirer being entitled to profits arising after that date, even if the purchase price is based on the net asset position of the acquiree at that date.

The date control is obtained will be dependent on a number of factors, including whether the acquisition arises from a public offer or a private deal, is subject to approval by other parties, or is effected by the issue of shares. For an acquisition by way of a public offer, the acquisition date could be:

- When the offer has become unconditional as a result of a sufficient number of acceptances being received.
- Or
- The date that the offer closes.

Since the nature of public offers can be different depending on the jurisdiction they are in, it is always necessary to consider the impact of the nature and terms of the offer and any other relevant laws or regulations in determining the date of acquisition.

In a private deal, the date would generally be when an unconditional offer has been accepted by the vendors, providing the control criteria in FRS 102 are met.

It can be seen from the above that one of the key factors is that the offer is 'unconditional'. Thus, where an offer is conditional on the approval of the acquiring entity's shareholders then until that approval has been received, it is unlikely that control will have been obtained. Where the offer is conditional upon receiving some form of regulatory approval, then it will depend on the nature of that approval. Where it is a substantive hurdle, such as obtaining the approval of a competition authority, it is unlikely that control could have been obtained prior to that approval. However, where the approval is merely a formality, or 'rubber-stamping' exercise, then this would not preclude control having been obtained at an earlier date, provided that at that earlier date, the acquirer effectively obtains power to direct the relevant activities of the acquiree.

Where the acquisition is effected by the issue of shares, then the date of control will generally be when the exchange of shares takes place.

The acquirer's statement of comprehensive income incorporates the acquiree's profits or losses after the acquisition date by including the acquiree's income and expenses based on the cost of the business combination to the acquirer. Many items will have a fair value on acquisition that will affect subsequent recognition of income and expense. FRS 102 gives the example of depreciation expense, which will be based on the fair values of the related depreciable assets recognised in the consolidated financial statements at the acquisition date. [FRS 102.19.16].

3.6 Measuring the cost of the business combination

Having identified the acquirer and determined the acquisition date, the next step is for the acquirer to measure the cost of the business combination. Section 19 requires this to be the aggregate of: [FRS 102.19.11]

- The fair values, at the acquisition date, of assets given, liabilities incurred or assumed, and equity instruments issued by the acquirer, in exchange for control of the acquiree (see 3.7 below).
- And
- Any costs directly attributable to the business combination (see 3.6.1 below).

In a step acquisition, i.e., where control is achieved in a series of transactions, the cost of the business combination is the aggregate of the fair values of the assets given, liabilities assumed, and equity instruments issued by the acquirer at the date of each transaction in the series. [FRS 102.19.11A]. The accounting treatment for step acquisitions (including the treatment of directly attributable costs) is discussed further at 3.11 below.

Section 19 requires an entity to consider the substance of an arrangement so that it can determine what is (and, therefore, what is not) part of the cost of the business combination specifically in regard to contingent payments (see 3.6.2 below). [FRS 102.19.11B]. However, in addition to contingent payments, there are other arrangements that can arise that also need to be assessed to determine if they are or are not part of the cost of the business combination. Examples of other arrangements include settlement of pre-existing transactions between the acquirer and acquiree or the acquiree and third parties, and reimbursement of acquiree costs by the acquirer. Determination of whether these costs are a cost of the business combination is discussed in more detail at 3.6.3 below.

Section 19 is clear that the cost of a transaction that remunerates employees or former owners of the acquiree for future services is not part of the cost of a business combination. See 3.6.2.B below for further discussion. [FRS 102.19.11B].

Where equity instruments issued by the acquirer are given as consideration to the selling shareholder, the fair value of those equity instruments is determined based on the guidance in Section 2A of FRS 102. [FRS 102.2A]. It must be noted that while 'merger relief' and 'group reconstruction relief' under the CA 2006 include relief from recognising share premium where certain conditions are met, this affects the accounting considerations for capital and reserves of the issuing entity only, and is not relevant for the purposes of measuring the cost of the combination in connection with application of the purchase method - see 5.5 below for discussion of merger relief and group reconstruction relief.

3.6.1 Costs directly attributable to the combination

The cost of a business combination includes any costs directly attributable to the combination. [FRS 102.19.11(b)].

How we see it

FRS 102 does not indicate what types of costs are directly attributable to the combination, but we consider that they could include costs such as professional fees paid to accountants, legal advisers, valuers and other consultants. General administrative costs, including the costs of maintaining an acquisitions department, and other costs that cannot be directly attributed to the particular combination being accounted for would not be included in the cost of the combination - they are recognised as an expense when incurred.

It may be that an entity engages another party to investigate or assist in identifying a potential target. Whether any fee payable to such party can be included as part of the cost of the business combination will depend on whether the work performed can be regarded as directly attributable to that particular business combination. Where the fee is payable only if the combination takes place, then it must be included as part of the cost.

Transaction costs (for financial instruments) are incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or liability, or the issue of an entity's own equity instrument. [FRS 102 Appendix I]. These costs are not included as costs of the business combination but are accounted for as costs of issuing those instruments. [FRS 102.11.13, FRS 102.22.9]. They, therefore, do not affect the measurement of goodwill in the business combination.

Where professional advisors provide advice on all aspects of the business combination, including the arranging and issuing of financial liabilities and/or issuing equity instruments, it will be necessary for some allocation of the fees payable to be made, possibly by obtaining a breakdown from the relevant advisor.

It may be that an entity, at its balance sheet date, is in the process of acquiring another business and has incurred costs that are considered to be directly attributable to that expected business combination. At the balance sheet date, the entity has not yet obtained control over the business. In this situation how are the costs accounted for?

How we see it

We believe that since directly attributable costs are to be included in the cost of a business combination, then the costs are carried forward as an asset from the date that is considered probable that the business combination will be completed. Any costs incurred prior to the date that it is considered probable that the business combination will be completed are expensed and remain written off regardless of whether the acquisition takes place; they cannot be reinstated and capitalised at a later date.

In the subsequent period when the business combination is completed, the costs carried forward will be reclassified as part of the cost of the business combination (and therefore into goodwill). If in the subsequent period it is no longer considered probable that the business combination will be completed, then the costs initially recognised as an asset will be expensed to the income statement.

3.6.2 Adjustments to the cost of a business combination contingent on future events ('Contingent consideration')

Section 19 recognises that the terms of a business combination agreement may provide for an adjustment to the cost of the combination contingent on future events (generally referred to as 'contingent consideration'). 'Future events' include events that affect the amount of the payment and not just those that affect whether a specified payment is required or not. Thus, any consideration for a business combination where the amount or the timing is not known with certainty is contingent consideration.

The following are three examples of additional payments made to selling shareholders that are contingent on future events:

- An additional payment of £X million if the acquiree's profit in the year after acquisition exceeds £Y million.
- An additional payment of £X million if a drug currently under development receives regulatory approval at a later date.

And

- An additional payment of Z% of actual EBITDA of the acquiree in the year after acquisition.

The first example of an 'earn-out' clause - whereby the acquirer agrees to pay additional amounts if the future earnings of the acquiree exceed specified amounts - is a typical example of contingent consideration relating to the value of the acquiree.

For contingent consideration, the acquirer includes an estimate of that adjustment (reflecting the time value of money, if material) in the cost of the combination at the acquisition date if the adjustment is probable (i.e., more likely than not) and can be measured reliably. [FRS 102.19.12].

An adjustment is more likely to be made in those situations where the contingent consideration is based on the acquiree maintaining a level of profits which it is currently earning (either for a particular period or as an average over a set period) or achieving profits which it is currently budgeting.

If the potential adjustment is not recognised at the acquisition date but subsequently becomes probable and can be measured reliably, the additional consideration is treated as an adjustment (reflecting the time value of money, if material) to the cost of the combination. [FRS 102.19.13]. If the future events that, at the acquisition date, were expected to occur do not occur, or the estimate needs to be revised, the cost of the business combination is adjusted accordingly. [FRS 102.19.13A]. Any subsequent adjustments in respect of contingent consideration will consequently be reflected in the carrying amount of goodwill except that, if contingent consideration is adjusted for the time value of money, the unwinding of any discounting is recognised as a finance cost in profit or loss, in the period it arises. [FRS 102.19.13B]. If an impairment loss has already been recognised in respect of the goodwill (see Chapter 29), subsequent adjustments to goodwill may require a further impairment loss to be recognised.

FRS 102 does not address whether these adjustments must be reflected retrospectively or prospectively.

How we see it

In our view, changes in the probability of an event occurring (or not) that reflect conditions arising after the acquisition date, represent a change in estimate.

Changes in accounting estimates are accounted for prospectively (see Chapter 9 at 3.4).

FRS 102 does not provide guidance on determining the discount rate to be used in respect of contingent consideration.

How we see it

In our view, in determining a discount rate to be used in respect of contingent consideration, an entity can determine an accounting policy, to be applied consistently, either by analogy to financial liabilities at amortised cost or to provisions.

The following Illustration shows how changes to discount rates could be considered.

Illustration 3-7: Discount rate in contingent consideration subsequently adjusted

Entity A acquired Entity B on 31 December 20X6, and the consideration includes £8 million that is contingent on meeting a profit target by 31 December 20X9, three years later.

At the date of acquisition, it was considered probable that the acquiree would meet the profit target, when the appropriate discount rate was 8%. Accordingly, £6,350,658 (see table below) was recognised as part of the cost of the business combination in the financial statements for 31 December 20X6.

At 31 December 20X7, Entity A's assessment remains that payment of £8 million at 31 December 20X9 is probable, so its estimate of cash flows is the same as the prior period end. However, changes in circumstances at 31 December 20X7 mean that the discount rate would be 7%.

Must Entity A adjust its contingent consideration liability for the update in discount rate?

The relevant present values are as follows:

	PV at 8%	PV at 7%
	£	£
31 December 20X6	6,350,658	6,530,383
Interest for 20X7	508,053	457,127
31 December 20X7	6,858,711	6,987,510
Interest for 20X8	548,696	489,126
31 December 20X8	7,407,407	7,476,636
Interest for 20X9	592,593	523,364
31 December 20X9	8,000,000	8,000,000

Whether the discount rate is updated at 31 December 20X7 is not clear from FRS 102. A contingent consideration liability could be considered similar to a financial liability (which would not qualify as a basic instrument under Section 11 *Basic Financial Instruments*) or a provision. However, the accounting by the acquirer for contingent consideration in a business combination is out of scope of both Section 12 *Other Financial Instruments Issues* and Section 21 *Provisions and Contingencies*. [FRS 102.12.3(g), FRS 102.21.1]. If the entity applies the hierarchy in paragraph 5(a) of Section 10 to refer to other relevant guidance within FRS 102 regarding discounted liabilities, then Entity A analogises to the discounting of either a financial liability at amortised cost or a provision. Under an amortised cost model, the discount rate would not be updated. [FRS 102.11.16, FRS 102.11.20]. Analogising to a provisions model, the discount rate would be updated at each reporting date. [FRS 102.21.11].

Therefore, depending on the entity's chosen policy, the liability is discounted at the rate determined at 31 December 20X6 (following an amortised cost model) or 31 December 20X7 (following a provisions model). Following an amortised cost model, the liability accretes at the original discount rate of 8%, interest of £508,053 is recognised in the income statement for 20X7 and no adjustment is made to goodwill. Following a provisions model, the same interest would be recognised in the income statement and an adjustment of £128,799 is made to the cost of the combination (and therefore goodwill) to record the liability at £6,987,510 at 31 December 20X7. This adjustment to goodwill arises from a change in the present value of the estimated cash flows. As a change in estimate, the adjustment is made at the date of change rather than calculated retrospectively. The resulting liability is reassessed at each reporting date thereafter for changes in estimated cash flows (and changes in discount rate when following a provisions model), and any necessary adjustment made to the cost of the combination (and therefore goodwill).

3.6.2.A Contingent consideration to be settled by equity instruments

In some business combination agreements involving contingent consideration, additional consideration is settled not by cash, but by shares.

Section 19 makes no explicit reference to such a situation. Section 11 and Section 12 both scope out from their provisions "Financial instruments that meet the definition of an entity's own equity", [FRS 102.11.7(b), FRS 102.12.3(e)], Section 12 and Section 22 *Liabilities and Equity* both scope out from their respective requirements "Contracts for contingent consideration in a business combination" (this exemption applies only to the acquirer), [FRS 102.12.3(g), FRS 102.22.2(c)], and Section 26 scopes out, "equity instruments issued in a business combination in exchange for control of the acquiree". [FRS 102.26.1B].

In practice, there is a wide variety of share-settled contingent consideration arrangements, but they are generally based on one of two models:

- Arrangements whereby shares are issued to a particular value based on certain conditions being met, e.g., if profits are £A then additional consideration of £M will be given, to be satisfied by shares based on the share price at date of issue.

Or

- Arrangements whereby a particular number of shares are issued if certain conditions are met, e.g., if profits are £A then X shares will be issued, but if profits are £B then Y shares will be issued.

The issues that need to be considered in accounting for such arrangements are:

- If the consideration is recognised, is it classified as a liability or as equity?
- How is the consideration valued, both on initial recognition and if reassessed at a later date?

Illustration 3-8: Share-settled contingent consideration (1)

Entity P acquires a 100% interest in Entity S on 31 December 20X5. As part of the consideration arrangements, additional consideration will be payable on 1 January 20X9, based on Entity S meeting certain profit targets over the three years ended 31 December 20X8, as follows:

<i>Profit target (average profits over 3-year period)</i>	<i>Additional consideration</i>
£1m but less than £1.25m	£5m
£1.25m but less than £1.5m	£6m
£1.5m+	£7.5m

Any additional consideration will be satisfied by issuing the appropriate number of shares with a value equivalent to the additional consideration payable based on Entity P's share price at 1 January 20X9.

At the date of acquisition, Entity P considers that it is probable that Entity S will meet the first profit target, but not the others.

How does Entity P classify the additional consideration in its financial statements for the year ended 31 December 20X5, and what amount must be recognised in respect of it?

As discussed above, contracts for contingent consideration are specifically scoped out of Section 22 and Section 26.

How we see it

In our view, the principles of Section 22 are relevant to determining the appropriate classification of such arrangements. Section 22 classifies a contract that will or may be settled in the entity's own equity instruments as a financial liability if the contract is a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments. Therefore, classification as a liability seems appropriate in this situation.

On the basis that the consideration is reflected as a liability then, as with contingent consideration payable in cash, the amount to be recognised at 31 December 20X5 must be the present value of the £5m consideration expected to be payable on 1 January 20X9.

If, at 31 December 20X7, Entity P considers that it is probable that Entity S will now meet the second target, the liability is remeasured at that date to the present value of the £6m that is now expected to be payable on 1 January 20X9 with a corresponding adjustment to goodwill, having reflected the unwinding of the discount on the original £5m in the income statement. In determining the present value as at 31 December 20X7, whether the discount rate is updated at that date or remains the original discount rate calculated at initial recognition depends on the accounting policy adopted by Entity P. This is further explained in Illustration 3-7 above.

In Illustration 3-8 above, the arrangement was of the type where the number of shares issued to settle the consideration were equivalent to a particular value. However, what if the arrangement was of the type where a particular number of shares are to be issued to satisfy the consideration?

Illustration 3-9: Share-settled contingent consideration (2)

Entity P acquires a 100% interest in Entity S on 31 December 20X5. As part of the consideration arrangements, additional consideration will be payable on 1 January 20X9, based on Entity S meeting certain profit targets over the three years ended 31 December 20X8, as follows:

<i>Profit target</i>	<i>Additional consideration</i>
Year ended 31 December 20X6 - £1m+	100,000 shares
Year ended 31 December 20X7 - £1.25m+	150,000 shares
Year ended 31 December 20X8 - £1.5m+	200,000 shares

Each target is non-cumulative. If the target for a particular year is met, the additional consideration will be payable, irrespective of whether the targets for the other years are met or not. If a target for a particular year is not met, no shares will be issued in respect of that year. At the date of acquisition, Entity P considers that it is probable that Entity S will meet the first profit target, but not the others.

How does Entity P classify the additional consideration in its financial statements for the year ended 31 December 20X5, and what amount is recognised in respect of it?

Although Section 22 does not strictly apply, we consider that its principles are relevant to determining whether this type of arrangement is classified as a financial liability or equity.

Section 22 classifies a contract that will or may be settled in the entity's own equity instruments as a financial liability if the contract is a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments. [FRS 102.22.3(b)].

How we see it

In this scenario, as each of the targets are independent of one another, this arrangement can be regarded as being three distinct contingent consideration arrangements that are assessed separately. As either zero or the requisite number of shares will be issued if each target is met, the obligation in respect of each arrangement is classified as equity.

If the targets were dependent on each other, for example, if they were based on an average for the three-year period, a specified percentage increase on the previous year's profits, or the later targets were forfeited if the earlier targets were not met, the classification would be assessed on the overall arrangement. As this would mean that a variable number of shares may be delivered, the obligation under such an arrangement would have to be classified as a financial liability.

On the basis that the consideration is reflected as equity, Section 19's requirements are applied in measuring the amount recognised for the consideration, i.e., at the fair value at the acquisition date (31 December 20X5). [FRS 102.19.11(a)]. However, in this situation the fair value of the 'equity instrument' at the date of acquisition would need to take into account, for example, an allowance for any estimated dividends on the shares that will not be payable during the period until they are issued on 1 January 20X9.

One other issue that arises in this situation is whether adjustments must be made to the consideration, and thus goodwill, to reflect subsequent changes in the fair value of the shares such that the consideration is ultimately measured at Entity P's share price at the date the shares are finally issued.

How we see it

Although the requirements for contingent consideration would generally require subsequent changes in the estimate of the consideration that will ultimately be given, to be recognised, we do not believe that such changes in fair value (i.e., the share price) are reflected for equity instruments. Under FRS 102, equity instruments are measured at the fair value of cash or other resources received or receivable on the date of initial recognition. Once an equity instrument has been recognised, changes in the fair value of the equity instrument are not recognised in the financial statements.

At 31 December 20X5, Entity P considers that it is not probable that Entity S will meet the profit target for the year ended 31 December 20X7 and, therefore, no amount is reflected in equity for that profit target. [FRS 102.19.12]. If, at 31 December 20X6, this profit target becomes probable, then the financial statements at that date need to reflect that Entity P now expects to issue an additional 150,000 shares. [FRS 102.19.13]. As discussed above, we do not believe that any change is made to reflect changes in the value of Entity P's shares since the date of exchange (31 December 20X5), and so the additional consideration of 150,000 shares are valued using the same value per share as the original estimated consideration of 100,000 shares, with a consequent adjustment to goodwill.

3.6.2.B Distinguishing 'contingent consideration' from other arrangements

The cost of a business combination is the aggregate of "the fair values, at the acquisition date, of assets given, liabilities incurred or assumed, and equity instruments issued by the acquirer, *in exchange for control of the acquiree*" (*our emphasis added*). [FRS 102.19.11].

It is important to be able to identify those arrangements that represent contingent consideration from those that do not, because contingent consideration generally results in some form of adjustment to the accounting for a business combination (including goodwill). Notwithstanding the structuring of a purchase agreement, which may be for legal, tax, or other reasons, transactions and other events and conditions must be accounted for and presented in accordance with their substance and not merely their legal form. [FRS 102.2.8, FRS 102.19.11B].

The terms of other arrangements and the income tax treatment of contingent payments may indicate that contingent payments are attributable to something other than consideration for the acquiree. These can include agreements not to compete, executory contracts, consulting contracts and property lease agreements. For example, the acquirer might enter into a property lease arrangement with a significant selling shareholder. If the lease payments specified in the lease contract are significantly below market rate, some or all of the contingent payments to the lessor (the selling shareholder) required by a separate arrangement for contingent payments might be, in substance, payments for the use of the leased property that the acquirer is required to recognise separately in its post-combination financial statements.

FRS 102 explains that whether a contingent payment arrangement to employees or selling shareholders is contingent consideration or a separate transaction depends on the nature of the arrangement. The following factors (and additional guidance included in IFRS 3) can be helpful in evaluating the nature of the arrangement: [FRS 102.19.11B, IFRS 3.B50]

- The reasons why the agreement includes contingent payments.
Understanding the reasons why the parties to the combination, the acquirer and the acquiree and their owners, directors and managers - and their agents - entered into a particular transaction or arrangement may provide insight into whether it is part of the cost of the business combination and the assets acquired or liabilities assumed. If a transaction is arranged primarily for the benefit of the acquirer or the combined entity rather than for the benefit of the acquiree or its former owners before the combination, that portion of the transaction price paid (and any related assets or liabilities) is less likely to be part of the cost of the business combination for the acquiree. The acquirer would account for that portion separately from the business combination.
- Who initiated the arrangement.
A transaction or other event that is initiated by the acquirer may be entered into for the purpose of providing future economic benefits to the acquirer or combined entity with little or no benefit received by the acquiree or its former owners before the combination. A transaction or arrangement initiated by the acquiree or its former owners is less likely to be for the benefit of the acquirer or the combined entity and more likely to be part of the business combination transaction.
And
- When the parties entered into the arrangement.
A transaction between the acquirer and the acquiree during the negotiations of the terms of a business combination may have been entered into in contemplation of the business combination to provide future economic benefits to the acquirer or the combined entity. If so, the acquiree or its former owners before the business combination are likely to receive little or no benefit from the transaction except for benefits they receive as part of the combined entity.

If the cost of a transaction remunerates employees or former owners of the acquiree for future services, then that cost is not part of the cost of a business combination. This is discussed further in 3.6.2.C below.

The following Illustration shows an arrangement where the additional payments that may be made to the selling shareholders under the business combination agreement are not accounted for as 'contingent consideration' under FRS 102.

Illustration 3-10: Selling shareholder retains a customer relationship with acquiree and is entitled to volume rebates on purchases it makes

Target is a subsidiary of Vendor Entity. Target provides goods and services to Vendor Entity that represent a significant portion of Target's business. Acquirer acquires 100% of the issued shares of Target. The purchase price is considered to represent the fair value of Target.

As part of the business combination agreement, Acquirer agrees to pay Vendor Entity a volume rebate for the next 5 years if Vendor Entity's purchases from Target exceed a specified amount in each of those years. The volume rebate offered is consistent with terms offered to other customers.

The volume rebate agreement with the vendor is not accounted for as contingent consideration because it is not consideration for the acquisition of control in Target. The purchase price paid for the issued shares of Target is considered to represent fair value of Target; and Acquirer will be required to pay the volume rebates only in the event that Vendor Entity's purchases exceed a specified amount. The volume rebate arrangement is merely a means of securing Vendor Entity's custom for the next five years. Therefore, whilst the volume rebate arrangement arises by virtue of Acquirer having acquired Target, it does not represent additional consideration for the acquisition of a controlling interest in Target. Additionally, the contingency does not relate to the value of the business acquired because payment is contingent on Vendor Entity's future purchases exceeding a specified amount.

3.6.2.C Contingent consideration relating to future services

A particular example of a situation where selling shareholders may have a continuing relationship with the acquirer is where they become, or continue to be, key employees of the acquiree subsequent to the acquisition.

Section 19 of FRS 102 specifically identifies a transaction that remunerates employees or former owners of the acquiree for future services and not part of the cost of the business combination. Whether arrangements for contingent payments to employees or selling shareholders are contingent consideration to be included in the business combination (see 3.6.2 above) or are separate transactions to be accounted for as remuneration under Section 26 (if a share-based payment) or Section 28 *Employee Benefits*, will depend on the nature of the arrangements. [FRS 102.19.11B].

Understanding the reasons why the acquisition agreement includes a provision for contingent payments, who initiated the arrangement and when the parties entered into the arrangement can be helpful in assessing the nature of the arrangement. [FRS 102.19.11B]. Entities will need to apply judgement in evaluating the substance of the contingent consideration. In making such a judgement, entities may consider the requirements and guidance in adopted IFRS dealing with similar or related issues. [FRS 102.10.6]. IFRS 3 contains specific guidance for determining whether arrangements for contingent payments to employees or selling shareholders are contingent consideration in the business combination or are separate transactions. This includes consideration of a number of indicators relating to:

- Continuing employment
 - Duration of continuing employment
 - Level of other elements of remuneration
 - incremental payments to other non-employee selling shareholders
 - Relative number of shares owned by selling shareholders that remain as key employees (or parties related to them)
 - Linkage of payments to valuation of business
- And
- The formula for additional payments [IFRS 3.B54, IFRS 3.B55]

In making such an evaluation, all terms of the agreement have a critical role in this assessment, and the reasons for structuring the terms of the transaction in a particular way, and the identity of the initiator, must be understood. While IFRS 3 is clear that, "A contingent consideration arrangement in which the payments are automatically forfeited if employment terminates is remuneration for post-combination services", [IFRS 3.B55(a)], this requirement is not replicated in FRS 102.

How we see it

When an agreement includes employment conditions such that the payments are forfeited upon termination of employment, all or a portion of, the additional payments will generally be classified as employment compensation.

Illustration 3-11: Contingent payments to employees

Entity B appointed a candidate as its new CEO under a ten-year contract. The contract required Entity B to pay the candidate CU5m if Entity B is acquired before the contract expires. Entity A acquires Entity B eight years later. The CEO was still employed at the acquisition date and will receive the additional payment under the existing contract.

In this example, Entity B entered into the employment agreement before the negotiations of the combination began, and the purpose of the agreement was to obtain the services of the CEO. Thus, there is no evidence that the agreement was arranged primarily to benefit Entity A or the combined entity. Therefore, the liability to pay CU5m is accounted for as part of the acquisition of Entity B.

In other circumstances, Entity B might enter into a similar agreement with the CEO at the suggestion of Entity A during the negotiations for the business combination. If so, the primary purpose of the agreement might be to provide severance pay to the CEO, and the agreement may primarily benefit Entity A or the combined entity rather than Entity B or its former owners. In that situation, Entity A accounts for the liability to pay the CEO in its post-combination financial statements separately from the acquisition of Entity B.

If the consideration takes the form of share-based payments, it is necessary to determine how much of the share-based payment relates to the acquisition of control (which forms part of the cost of combination, accounted for under Section 19) and how much relates to the provision of future services (which is a post-combination operating expense accounted for under Section 26). This would be the case if, for example, the selling shareholder of an acquired entity receives a share-based payment for transferring control of the entity and for remaining in continuing employment.

Acquirers often exchange share-based payment awards (i.e., replacement awards) for awards held by employees of the acquiree. These exchanges frequently occur because the acquirer wants to avoid the effect of having non-controlling interests in the acquiree, the acquirer's shares are often more liquid than the shares of the acquired business after the acquisition, and/or to motivate former employees of the acquiree toward the overall performance of the combined, post-acquisition business. The accounting for replacement share-based payment awards issued in a business combinations is dealt with in Chapter 28 at 12.

3.6.3 Assessing what arrangements are included in the cost of the business combination

To be included in the accounting for the business combination, the identifiable assets given, liabilities assumed, and equity instruments issued by the acquirer must be in exchange for control of the acquiree. [FRS 102.19.11].

FRS 102 provides guidance in paragraph 19.11B on the factors to consider when determining whether a contingent payment to employees or selling shareholders is contingent consideration in the business combination and therefore included in the cost of the business combination or is a separate transaction (see 3.6.2 above). However, FRS 102 provides no further guidance in distinguishing between consideration given in exchange for control of the acquiree and payments pertaining to other arrangements, outside of a contingent payment. In practice, the acquirer and the acquiree may have a pre-existing relationship (which could be contractual (e.g., vendor and customer) or non-contractual (such as plaintiff and defendant)) or an other arrangement before the negotiations for the business combination, or they may enter into an arrangement during the negotiations that is separate from the business combination. In either situation, the acquirer must identify any amounts that are separate from the business combination and thus are not part of the cost of the combination. Examples of pre-existing relationships include unresolved legal claims and disputes, contractual supply contracts, lease contracts, loan arrangements, existing balances between the acquirer and acquiree, and reacquired rights.

How we see it

We believe that the factors identified in paragraph 19.11B of FRS 102, relevant to distinguishing contingent consideration in the business combination from separate transactions, are also relevant factors to consider when assessing other arrangements such as pre-existing relationships or arrangements entered into during the negotiations for the business combination.

IFRS 3 specifically addresses the accounting for a transaction that in effect settles a pre-existing relationship between the acquirer and the acquiree, on which FRS 102 is silent. An entity could look to the requirements in IFRS 3 when developing an accounting policy under the hierarchy in Section 10.

One particular area that could be negotiated between the acquirer and the acquiree, or its former owners, is a restructuring plan relating to the acquiree's activities. Section 19 is clear that unless the acquiree has, at the acquisition date, an existing liability for restructuring, then the acquirer must not recognise liabilities for terminating or reducing the activities of the acquiree as part of the business combination. [FRS 102.19.15D(a)]. See further discussion at 3.7.1.A below.

3.7 Allocating the cost of the business combination to the assets acquired and liabilities and contingent liabilities assumed

Having determined the cost of the business combination, the next stage is to allocate that cost to the assets acquired, and liabilities and contingent liabilities assumed.

The acquirer must, at the acquisition date, allocate the cost of a business combination by recognising the acquiree's identifiable assets, liabilities and a provision for its contingent liabilities at their fair values at that date except for the following: [FRS 102.19.14, FRS 102.19.15]

- The recognition and measurement of deferred tax assets and liabilities (see 3.7.2.A below). [FRS 102.19.15A]
 - The recognition and measurement of assets and liabilities related to employee benefit arrangements (see 3.7.2.B below). [FRS 102.19.15B]
 - The recognition and measurement of share-based payment arrangements (see 3.7.2.C below). [FRS 102.19.15C]
 - The recognition and measurement of provisions and contingent liabilities (see 3.7.1.A below). [FRS 102.19.15D, FRS 102.19.15E, FRS 102.19.15F]
 - The recognition of intangibles separately from goodwill (see 3.7.3.A below). [FRS 102.19.15G]
- And
- The recognition and measurement of leases in which the acquiree is the lessee (see 3.7.2.D below). [FRS 102.19.19A]

Any difference between the cost of the business combination and the acquirer's interest in the net amount of the identifiable assets, liabilities and provisions for contingent liabilities so recognised is accounted for as goodwill or negative goodwill (see 3.9 below). [FRS 102.19.14, FRS 102.19.22, FRS 102.19.23, FRS 102.19.24].

Except as specified in paragraphs 19.15A to 19.15F of FRS 102, the acquirer recognises separately the acquiree's identifiable assets acquired and liabilities assumed at the acquisition date only if: [FRS 102.19.15]

- They meet the assets and liabilities definitions in Section 2 *Concepts and Pervasive Principles* at the acquisition date (see Chapter 4 at 3.5.1 and 3.5.2).
 - Their fair value can be measured reliably.
- And
- They are part of what the acquirer and acquiree exchanged in the business combination rather than as the result of separate transactions (see 3.6.3 above).

No contingent assets must be recognised at the acquisition date. [FRS 102.19.15].

How we see it

Section 21 states that "when the flow of future economic benefits to the entity is virtually certain, then the related asset is not a contingent asset, and its recognition is appropriate". [FRS 102.21.13]. As such, we consider that it is reasonable to conclude that a virtually certain asset can be recognised in a business combination. This approach avoids a day 2 gain, which would arise if a virtually certain contingent asset was not recognised in a business combination. Recognition of an asset also reflects that an acquirer would ascribe value to the virtually certain asset which results in a more meaningful residual goodwill.

3.7.1 Recognition exceptions

3.7.1.A Provisions and contingencies

The recognition exception within Section 19 requires an acquirer to apply specific guidance in Section 21 (instead of the definitions in Section 2) to determine whether, at the acquisition date, a present obligation exists as a result of past events. [FRS 102.19.15D, FRS 102.21.4(a), FRS 102.21.4A, FRS 102.21.6]. See Chapter 24 at 3.2.1.

In addition to the guidance in Section 21, Section 19 provides examples of applying Section 21 to business combinations. These are:

- The acquirer must recognise liabilities for terminating or reducing the activities of the acquiree as part of allocating the cost of the combination only to the extent that the acquiree has at the acquisition date, an existing liability for restructuring recognised in accordance with Section 21. *[FRS 102.19.15D(a)]*.
And
- The acquirer, when allocating the cost of the combination, must not recognise liabilities for future losses or other costs expected to be incurred as a result of the business combination. *[FRS 102.19.15D(b)]*.

Section 19 requires that the acquirer recognises, at the acquisition date, a contingent liability assumed in a business combination if it is a present obligation that arises from past events and its fair value can be measured reliably. Therefore, contrary to the recognition requirements of Section 21 which would apply in the acquiree's financial statements, the acquirer recognises a contingent liability assumed in a business combination at the acquisition date even if it is not probable that the acquirer will be required to transfer economic benefits in settlement. *[FRS 102.19.15F, FRS 102.21.4]*. If a contingent liability only represents a possible obligation arising from a past event, whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity, no liability is recognised under FRS 102. In addition, no liability is recognised if the acquisition-date fair value of a contingent liability cannot be measured reliably. *[FRS 102.19.15E, FRS 102.19.15F]*.

Whilst not meeting the recognition criteria under the standard in the financial statements of the acquiree, the contingent liability has a fair value, which reflects market expectations about any uncertainty surrounding the possibility that an outflow of resources will be required to settle the obligation. Accordingly, under FRS 102, the allocation of the cost of the business combination includes the separate recognition of the acquiree's contingent liabilities, if their fair value can be reliably measured.

[FRS 102.19.15F].

Since the recognition of this liability is not in accordance with Section 21, Section 19 includes requirements for the subsequent measurement of such liabilities. Accordingly, after their initial recognition, the acquirer measures contingent liabilities recognised in a business combination at the higher of: *[FRS 102.19.15F, FRS 102.19.24A]*

- (a) The amount that would be recognised in accordance with Section 21.
And

- (b) The amount initially recognised less, if appropriate, the cumulative amount of income recognised in accordance with Section 23 *Revenue from Contracts with Customers*.

The implications of part (a) of this requirement are clear. If the acquiree has to recognise a provision in respect of the former contingent liability, and the best estimate of this liability is higher than the original fair value attributed by the acquirer, then the greater liability will now be recognised by the acquirer with the difference taken to the income statement. It would now be a provision to be measured and recognised in accordance with Section 21. What is less clear is part (b) of the requirement.

How we see it

The reference to "the cumulative amount of income recognised in accordance with the principles of Section 23" in paragraph 19.24A of FRS 102 in (b) above might relate to the recognition of income in respect of those contingent liabilities of the acquiree that have been recognised at fair value at the date of acquisition. The requirement would appear to mean that, unless the recognition of income in accordance with the principles of Section 23 is appropriate, the amount of the liability cannot be reduced below its originally attributed fair value until the liability is settled, cancelled or expires.

Section 19 makes it clear that this requirement does not apply to contracts accounted for in accordance with IAS 39 *Financial Instruments: Recognition and Measurement* or IFRS 9, where the policy options to apply these standards to the recognition and measurement of financial instruments are taken.

[FRS 102.19.24A, FRS 102.11.2(b), FRS 102.12.2(b), FRS 102.11.2(c), FRS 102.12.2(c)]. This would appear to mean that contracts that are not accounted for in accordance with IAS 39 or IFRS 9 but are accounted for by applying Section 21 will fall within the requirements of paragraph 24A of Section 19, as outlined above. For example, this would include loan commitments accounted for under Section 21 rather than IAS 39 or IFRS 9 (or Sections 11 and 12 of FRS 102), i.e., loan commitments other than those that are commitments to provide loans at below-market interest rates. [FRS 102.21.1B(a)]. Another example would be financial guarantee contracts accounted for under Section 21, rather than under IAS 39 or IFRS 9, [FRS 102.21.1A], or FRS 103 *Insurance Contracts* (see 3.7.3.C below),

One particular area that could be negotiated between the acquirer and the acquiree or its former owners is a restructuring plan relating to the acquiree's activities.

How we see it

In our view, a restructuring plan that is implemented by or at the request of the acquirer is not a liability of the acquiree as at the date of acquisition and cannot be part of the accounting for the business combination under the acquisition method, regardless of whether the combination is contingent on the plan being implemented.

A restructuring plan that is decided upon or put in place between the date the negotiations for the business combination started and the date the business combination is completed is only likely to be accounted for as a pre-combination transaction of the acquiree if there is no evidence that the acquirer initiated the restructuring, and the plan makes commercial sense even if the business combination does not proceed.

If a plan initiated by the acquirer is implemented without an explicit link to the business combination, this may indicate that control has already passed to the acquirer at this earlier date.

3.7.2 Recognition and measurement exceptions

3.7.2.A Deferred tax assets and liabilities

The acquirer must recognise and measure a deferred tax asset or liability arising from the assets acquired and liabilities assumed in accordance with Section 29 *Income Tax*. [FRS 102.19.15A]. To require the normal fair value treatment on acquisition would have resulted in immediate gains or losses being recognised when the deferred tax assets and liabilities were subsequently measured in accordance with Section 29, for example where fair values reflected the effects of discounting, but measurement under Section 29 would be on an undiscounted basis.

Under Section 29, when the tax base of an asset (other than goodwill) that is recognised in a business combination is less (or more) than the value at which the asset is recognised, a deferred tax liability (or asset) is recognised for the additional tax that will be paid (avoided) in respect of that difference. Similarly, a deferred tax asset (or liability) is recognised for the additional tax that will be avoided (or paid) because of a difference between the value at which a liability is recognised and the tax base of that liability. The amount attributed to goodwill (or negative goodwill) is adjusted by the amount of deferred tax recognised. [FRS 102.29.11].

In this context, the tax base of an asset is the amount that can be deducted for tax, and the tax base of a liability is the amount that will be assessed for tax. [FRS 102 Appendix I]. In determining the tax base of an asset or a liability an entity considers the manner in which the entity expects, at the end of the reporting period, to recover or settle the carrying amount of the relevant asset or liability. [FRS 102.29.11A].

The requirement to recognise deferred tax in a business combination, which is discussed further in Chapter 31 at 6.6, is an exception to the general 'timing differences' approach in Section 29.

3.7.2.B Employee benefit assets and liabilities

The acquirer recognises and measures a liability (or asset, if any) related to the acquiree's employee benefit arrangements in accordance with Section 28. [FRS 102.19.15B]. See Chapter 30.

3.7.2.C Share-based payment transactions

The acquirer recognises and measures a share-based payment in accordance with Section 26. [FRS 102.19.15C]. See Chapter 28 at 3.3.3. Guidance on accounting for replacement share awards in a business combination is discussed in Chapter 28 at 12.

Equity instruments granted to the employees of the acquiree in their capacity as employees (e.g., in return for continued service following the business combination) do not form part of the consideration for the business combination and are therefore within the scope of Section 26 as a share-based payment transaction, as are the cancellation, replacement or modification of a share-based payment transaction as the result of a business combination or other equity restructuring. [FRS 102.26.1B]

If a selling shareholder of an acquired business remains as an employee of that business following the business combination and receives a share-based payment for transferring control of the entity and for remaining in continuing employment, it is necessary to determine how much of the share-based payment relates to the acquisition of control (and therefore forms part of the consideration for the business combination) and how much relates to the provision of future services (which is a post-combination operating expense, see 3.6.2.C above).

3.7.2.D Leases in which the acquiree is the lessee

Section 19 requires the acquirer to measure the acquired right-of-use assets and lease liabilities as if the lease contract were a new lease at the acquisition date. That is, the acquirer applies the initial measurement provisions of Section 20 *Leases* to determine the lease liability, using the present value of the remaining lease payments at the acquisition date. [FRS 102.19.19A, FRS 102.20.49]. The acquirer follows the requirements of Section 20 for determining the lease term, lease payments and discount rate as discussed in Chapter 23 at 5.

Section 19 further requires the acquirer to measure the right-of-use asset at an amount equal to the recognised liability, adjusted to reflect the favourable or unfavourable terms of the lease, relative to market terms. [FRS 102.19.19A]. As the off-market nature of the lease is captured in the right-of-use asset, the acquirer does not separately recognise an intangible asset or liability for favourable or unfavourable lease terms relative to market terms.

It might appear unclear as to how this requirement is to be applied to fully or partially prepaid leases acquired in a business combination. The prepaid right to use obtained by the acquirer has a value. The question is whether such right is required to be presented as a separate intangible asset or as an adjustment to the carrying value of the right-of-use asset.

How we see it

We believe that from the perspective of a market participant, an acquired fully or partially prepaid lease in a business combination is not 'at market' since the acquirer obtains the right to use the underlying asset without assuming an obligation to pay the market price for that right. Therefore, the fair value of such right ought to be considered in determining any off-market adjustment to the right-of-use asset at the acquisition date.

Illustration 3-12: Fully prepaid leases acquired in a business combination

Entity A acquires a 100% interest in Entity B for cash. At the acquisition date, Entity B recognised in its statement of financial position a right-of-use asset equal to the unamortised prepayment for the fully prepaid lease for the remaining five years of the lease term; an amount of £120.

If Entity B were to enter the new prepaid lease for the remaining five years at the date of acquisition it would have to pay £110 in advance for the whole period of the lease. The difference between the market price of the new prepaid lease of £110 and the assumed contractual obligation for future lease payments of nil represents the favourable terms of the lease from the perspective of the acquirer.

Consequently, at the date of acquisition, Entity A recognises a right-of-use asset of £110 and does not recognise any lease liability.

Under Section 19, the acquirer is not required to recognise right-of-use assets and lease liabilities for leases with lease terms which end within 12 months of the acquisition date or for which the underlying asset acquired in a business combination is of low value. [FRS 102.19.19A]. The determination of a low value underlying asset is discussed in more detail in Chapter 23 at 6.1.2.

3.7.3 Recognition and measurement of particular identifiable assets and liabilities

3.7.3.A Acquiree's intangible assets

The allocation of the cost of the business combination includes the separate recognition of the acquiree's intangible assets. This is irrespective of whether the asset had been recognised by the acquiree before the business combination. [FRS 102.19.15G].

An intangible asset is defined as "a resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity" [FRS 102.18.4A]. This differs from the definition of an 'asset' under Section 2.

An intangible asset acquired in a business combination is separately recognised if it: [FRS 102.18.4, FRS 102.18.8, FRS 102.19.15G]

- (a) Meets the recognition criteria (i.e., (i) it is probable that the expected future economic benefits that are attributable to the asset will flow; and (ii) that the fair value of the intangible asset can be measured reliably)
- (b) Arises from contractual or legal rights
- And
- (c) Is separable

In addition, an entity may choose to recognise additional intangible assets acquired in a business combination separately from goodwill for which (a) is satisfied and only one of (b) or (c) applies. The decision to recognise such additional intangible assets is a policy choice, to be applied consistently to a class of intangible assets (i.e., having a similar nature, function or use in the business). Licences are given by FRS 102 as an example of a category of intangible asset that may be treated as a separate class, however, further subdivision may be appropriate, for example, where different types of licences have different functions within the business. [FRS 102.18.8].

Where additional intangible assets are recognised, the nature of the intangible assets and the reason why they have been separated from goodwill must be disclosed. [FRS 102.18.28A].

The FRC considers that examples of intangible assets that would normally satisfy all three criteria (a) to (c) include: licences, copyrights, trademarks, internet domain names, patented technology and legally protected trade secrets. Examples of intangible assets that would not normally satisfy all three criteria include customer lists, customer relationships and unprotected trade secrets (such as secret recipes or formulas) as no contractual or legal right exists that would give rise to expected future economic benefits. [FRS 102.BC.B18.10].

The guidance in the Illustrative Examples of IFRS 3 might also be relevant to the identification of specific items although some differences to FRS 102 may arise as explained below the following table. [IFRS 3.IE16-IE44]. The table below summarises the items included in the Illustrative Examples that the IASB regards as meeting the definition of an intangible asset, noting that the examples are not intended to be all-inclusive. It is clear that the IASB envisages a wide range of items meeting the definition of an intangible asset, and therefore potentially being recognised separately from goodwill. The Illustrative Examples provide further explanations about some of these items.

<i>Intangible assets arising from contractual or other legal rights (regardless of being separable)</i>	<i>Other intangible assets that are separable</i>
Marketing-related ▪ Trademarks, trade names, service marks, collective marks and certification marks ▪ Internet domain names ▪ Trade dress (unique colour, shape or package design) ▪ Newspaper mastheads ▪ Non-competition agreements	
Customer-related ▪ Order or production backlogs ▪ Customer contracts and the related customer relationships	▪ Customer lists ▪ Non-contractual customer relationships

<i>Intangible assets arising from contractual or other legal rights (regardless of being separable)</i>	<i>Other intangible assets that are separable</i>
<i>Artistic-related</i> - Plays, operas and ballets - Books, magazines, newspapers and other literary works - Musical works such as compositions, song lyrics and advertising jingles - Pictures and photographs - Video and audio-visual material, including films, music videos and television programmes	
<i>Contract-based</i> - Licensing, royalty and standstill agreements - Advertising, construction, management, service or supply contracts - Construction permits - Franchise agreements - Operating and broadcasting rights - Servicing contracts such as mortgage servicing contracts - Employment contracts - Use rights such as drilling, water, air, timber-cutting and route authorities	
<i>Technology-based</i> - Patented technology - Computer software and mask works - Trade secrets such as secret formulas, processes or recipes	- Unpatented technology - Databases, including title plants

It can be seen from the table that customer relationships can potentially fall under either category. In the IASB's view, "Customer relationships meet the contractual-legal criterion if an entity has a practice of establishing contracts with its customers, regardless of whether a contract exists at the acquisition date." [IFRS 3.1E28]. In such cases, it does not matter whether or not the relationship is separable. It would only be if the relationship did not arise from a contract that recognition depends on the separability criterion.

As noted at 2.8 above, the IASB's view of the contractual nature of customer relationships appears to differ from the FRC's view expressed in the Basis of Conclusions as discussed above. Therefore, IFRS 3's guidance on customer relationships might not be relevant to an entity preparing financial statements under FRS 102.

An acquirer may intend not to use an acquired asset, for example, a brand name or research and development intangible asset or it may intend to use the asset in a way that is different from the way in which other market participants would use it. Section 19 requires the acquirer to recognise all such identifiable assets and measure them at their fair value determined in accordance with their highest and best use by market participants (see Chapter 10 at section 4.8.1). [FRS 102.19.11(a), FRS 102.2A.9, FRS 102 Appendix I]. This means that no immediate impairment loss is reflected if the acquirer does not intend to use the intangible asset to generate its own cash flows, but market participants would.

However, if the entity is not intending to use the intangible asset to generate cash flows, it is likely the expected useful life will be short.

3.7.3.B Assets and liabilities related to contracts with customers

As part of a business combination, an acquirer may assume liabilities or acquire assets recognised by the acquiree in accordance with Section 23, for example, contract assets, receivables or contract liabilities. Under Section 23, if an entity receives consideration from a customer, or consideration is due (i.e., a receivable), before the entity transfers a good or service to the customer, the entity presents a contract liability. [FRS 102.23.125]. An acquirer recognises a contract liability (sometimes referred to as deferred revenue) related to a contract with a customer that it has assumed if the acquiree has received consideration (or the amount is due) from the customer. To determine whether to recognise a contract liability, however, an acquirer may also need to consider the definition of a performance obligation in Section 23. That is, at the acquisition date, the acquirer would identify the remaining promised goods and services in a contract with a customer and evaluate whether the goods and services it must transfer to a customer in the future are an assumed performance obligation for which the acquired entity has received consideration (or the amount is due). This is important because the consideration received (or the amount due) may relate to a satisfied or partially satisfied performance obligation for which no (or not all) revenue was recognised pre-combination (e.g., due to variable consideration being constrained). Since it was not party to the acquiree's performance pre-combination, an acquirer may need to consider how that affects its financial statements. For example, whether any consideration received that relates to the acquiree's pre-combination performance is presented as revenue or other income.

Chapter 25 at 5 provides additional guidance on identifying performance obligations in a contract with a customer. If a contract liability for an assumed performance obligation is recognised, the acquirer derecognises the contract liability and recognises revenue as it provides those goods or services after the acquisition date.

In accordance with the requirements in Section 19, at the date of acquisition, an assumed contract liability is measured at its fair value, which would reflect the acquiree's obligation to transfer some (if the amount paid in advance covers only a portion of consideration for the remaining promised goods and services) or all (if the amount paid in advance covers full consideration for the remaining promised goods and services) of the remaining promised goods and services in a contract with a customer, as at the acquisition date. The fair value is measured in accordance with the requirements in Section 2A and may require significant judgement. One method that might be used in practice to measure fair value of the contract liability is a cost build-up approach. That approach is based on a market participant's estimate of the costs that will be incurred to fulfil the obligation plus a 'normal' profit margin for the level of effort or assumption of risk by the acquirer after the acquisition date. The normal profit margin also is from the perspective of a market participant and will not include any profit related to selling or other efforts completed prior to the acquisition date.

Illustration 3-13: Contract liability of an acquiree

Target is an electronics company that sells contracts to service all types of electronic equipment for an annual fee of £120,000 paid in advance. Acquirer purchases Target in a business combination. At the acquisition date, Target has one service contract outstanding with 6 months remaining and for which a contract liability of £60,000 was recorded in Target's pre-acquisition financial statements.

To fulfil the contract over its remaining 6-month term, Acquirer estimates that a market participant would incur costs of £45,000 and expect a profit margin for that fulfilment effort of 20% (i.e., £9,000) and thus would expect to receive £54,000 for the fulfilment of the remaining performance obligation.

Accordingly, Acquirer will recognise a contract liability of £54,000 in respect of the acquired customer contract.

The acquirer does not recognise a contract liability or a contract asset for a contract with a customer that is an executory contract (see Chapter 24 at 3.1.1.A) at the acquisition date. However, for executory contracts with customers with terms that are favourable or unfavourable relative to the market terms, the acquirer recognises either a liability assumed, or an asset acquired in a business combination (see 3.7.4.F below).

In addition to the contract liability, an acquirer may also assume refund liabilities of the acquiree. Under Section 23, an entity recognises a refund liability if the entity receives consideration from a customer and expects to refund some or all of that consideration to the customer, including refund liabilities relating to a sale with a right of return. [FRS 102.23.49]. A refund liability, therefore, is different from a contract liability and might be recognised even if at the acquisition date no contract liability is recognised. Under Section 19, refund liabilities are also measured at their fair value at the acquisition date with fair value determined in accordance with the requirements of Section 2A. The requirements in Section 2A for measuring the fair value of liabilities are discussed in more detail in Chapter 10 at 4.9.

If an entity performs by transferring goods or services to a customer before the customer pays consideration or before payment is due, the entity presents a contract as a contract asset, excluding any amounts presented as receivable. [FRS 102.23.126]. Contract assets represent entity's rights to consideration in exchange for goods or services that the entity has transferred to a customer when that right is conditioned on something other than the passage of time (e.g., the entity's future performance). [FRS 102 Appendix I]. A trade receivable is an unconditional right to receive consideration from the customer (see also Chapter 25 at 11.1.1). [FRS 102.23.127].

The value of acquired contracts with customers may be recognised in multiple assets and liabilities (e.g., receivables, contract assets, right of return assets, intangible assets, contract liabilities, refund liabilities).

Under Section 19, all acquired assets related to the contract with customers are measured at their fair value at the date of acquisition, determined under Section 2A. The Section 2A requirements for measuring the fair value of assets are discussed in more detail in Chapter 10 at 4.8.

When measuring the fair value of acquired contracts with customers, an acquirer must verify that all of the components of value have been considered (i.e., an acquirer is required to verify that none of the components of value have been omitted or double counted). An acquirer also must verify that all of the components are appropriately reflected in the fair value measurement. After the date of acquisition, an acquirer applies Section 23 to account for any of the acquiree's assets, liabilities, income and expenses that fall within that standard's scope. Because Section 23 does not measure revenue (or any assets or liabilities within its scope) on a fair value basis, so-called 'day 2' measurement differences may arise post-combination.

How we see it

Neither Section 19 nor Section 23 specify how to account for any 'day 2' measurement differences that may arise when an acquiree's assets, liabilities, income and expenses are within the scope of Section 23. Therefore, the acquirer will need to develop an accounting policy in accordance with Section 10.

3.7.3.C Insurance contracts

Section 19 of FRS 102 requires assets and liabilities acquired or assumed in a business combination to be measured at fair value. [FRS 102.19.14]. Insurance contracts are not exempt from these requirements and FRS 103 explicitly confirms that insurance liabilities assumed and insurance assets acquired in a business combination must be measured at fair value at the acquisition date. [FRS 103.2.27].

However, an insurer is permitted, but not required, to use an expanded presentation that splits the fair value of acquired insurance contracts into two components:

- (a) A liability measured in accordance with the acquirer's accounting policies for insurance contracts that it issues.
And
- (b) An intangible asset, representing the difference between (i) the fair value of the contractual insurance rights acquired, and insurance obligations assumed and (ii) the amount described in (a). As an exception to Section 18 of FRS 102, the subsequent measurement of this asset must be consistent with the measurement of the related insurance liabilities. [FRS 103.2.27(a), FRS 103.2.27(b)].

Further discussion on this topic can be found in Chapter 38 at 10.

3.7.4 Determining the acquisition-date fair values

The general principle is that the identifiable assets acquired, and liabilities assumed are measured at their acquisition-date fair values. [FRS 102 Appendix I].

Extract from FRS 102**Appendix I**

Fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. In the absence of any specific guidance provided in the relevant section of this FRS, the guidance in Section 2A <i>Fair Value Measurement</i> shall be used in determining fair value.

In the absence of any specific fair value guidance, the guidance in Section 2A is used to determine fair value. This includes the requirement to value non-financial assets at the highest and best use. [FRS 102.2A.9, FRS 102.2A.10, FRS 102.2A.11, FRS 102.2A.12]. See Chapter 10 at 4.8.1 for discussion of this guidance. Some guidance in other sections of FRS 102 relevant to specific assets and liabilities is discussed at 3.7.4.A to 3.7.4.G below.

Section 19 allows some assets and liabilities to be measured at other than fair value on initial recognition, as described in 3.7.2 above.

3.7.4.A Property, plant and equipment

In approaching the recognition and measurement of, for example, property, plant and equipment of the acquiree, the acquirer might look to the revaluation guidance included within Section 17. This refers to the guidance in Section 2A and notes that:

"The fair value of land and buildings is usually determined from market-based evidence by appraisal that is normally undertaken by professionally qualified valuers. The fair value of items of plant and equipment is usually their market value determined by appraisal. ... If there is no market-based evidence of fair value because of the specialised nature of the item of property, plant and equipment and the item is rarely sold, except as part of a continuing business, an entity may need to estimate fair value using an income or a depreciated replacement cost approach." [FRS 102.17.15C, FRS 102.17.15D].

Since assets are recognised at their acquisition-date fair values, it follows that the acquirer does not recognise a separate provision or valuation allowance for assets - such as accumulated depreciation.

3.7.4.B Intangible assets

Section 18 provides no guidance on the determination of fair value and so the general guidance in Section 2A is used (see Chapter 10). [FRS 102.2A.15, FRS 102.2A.20].

Extract from FRS 102**Valuation techniques**

- 2A.15** The entity shall use valuation techniques that are appropriate in the circumstances and for which sufficient data are available to measure fair value, maximising the use of inputs determined by reference to a market price in an active market. An entity shall use the following methodology to estimate fair value:
- (a) The best evidence of fair value is an unadjusted quoted price for an identical or comparable asset or liability in an active market at the measurement date.
 - (b) When an unadjusted quoted price is not available, the price of a recent orderly transaction between market participants for an identical or comparable asset or liability provides evidence of fair value. However, this price may not be a reliable estimate of fair value if there has been a significant change in economic circumstances or a significant period of time between the date of the transaction, and the measurement date.
 - (c) If neither (a) nor (b) above are available or reliable, the fair value shall be estimated using another valuation technique. The objective of using another valuation technique is to estimate the price at which an orderly transaction to sell an asset or to transfer a liability would take place between market participants at the measurement date
- 2A.20** Valuation techniques, or the use of multiple techniques, can often produce a range of reasonable valuations. The selection of the most appropriate fair value within the range requires judgement, considering qualitative and quantitative factors specific to the measurement.

Under FRS 102, there are three broad approaches to valuation techniques. [FRS 102.2A.16]. These are the market, income and cost approaches.

Income-based approaches are the most commonly used of the three in respect of intangible assets. These involve identifying the expected cash flows or economic benefits to be derived from the ownership of the particular intangible asset and calculating the fair value of an intangible asset at the present value of those cash flows.

Two income-based methods that are commonly used to value intangible assets are:

- The Multi Period Excess Earnings Method ('MEEM')

And

- The Relief from Royalty method

The multi-period excess earnings method is often used to value intangible assets that generate cash independently. The method isolates the contribution of the asset being valued by deducting the cash flows that can be attributed to complementary assets, ensuring that only the excess earnings attributable to the intangible asset are considered. The excess cash flows are then discounted to calculate a present value.

The Relief from Royalty method is often used to calculate the value of a trademark or trade name. This approach is based on the concept that if an entity owns a trademark, it does not have to pay for the use of it and therefore is relieved from paying a royalty. The amount of that theoretical payment is used as a surrogate for income attributable to the trademark. The valuation is arrived at by computing the present value of the after-tax royalty savings, calculated by applying an appropriate royalty rate to the projected revenue, using an appropriate discount rate. Although The Relief from Royalty Method is not explicitly called out as an approach under FRS 102, it is a common income approach for valuing intangible assets and would not be precluded from being utilised if it was the most appropriate valuation technique.

3.7.4.C Inventories

Section 13 *Inventories*, provides no guidance on determination of fair value.

One way of approaching inventory valuation on a business combination is as follows:

- Finished goods are valued using market prices less the costs of disposal and a reasonable profit allowance for the selling effort. All costs must be estimated using market participant assumptions.
- Work in progress is valued using market prices of finished goods less the costs a market participant would have to incur to obtain these market prices i.e., all costs to complete, costs of disposal and a reasonable profit allowance for the completion and selling effort. All costs must be estimated using market participant assumptions.

And

- Raw materials are valued using current replacement costs.

Illustration 3-14: Fair value of work in progress

Entity A, a dairy business, acquires Entity B on 30 June 20X6. Entity B also operates a dairy business and included in its inventory at the date of acquisition was work in progress being inventory of cheddar cheese in cellars of the dairy left to mature for a year. The carrying amount of this inventory, being the costs incurred to the date of acquisition, is £400,000.

The intention is to sell the cheese once it has matured. The market price of fully matured cheese of the same quality at 30 June 20X6 is £900,000. Future storage, marketing and selling expenses required to complete the process and market the product to retailers is estimated at £185,000, using market participant assumptions.

How is the fair value of the work in progress determined?

Based on the guidance above, the work in progress would be valued using market prices of finished goods less the sum of the costs to complete, the costs of disposal and a reasonable profit allowance for the completing and selling effort based on profit for similar finished goods. Judgement is required by entities in calculating a reasonable profit allowance relating to the completing and selling efforts.

One approach would be to use the cost structure of Entity A as a starting point to determine the reasonable profit allowance for subsequent costs to be incurred by a market participant. Accordingly, it may be that Entity A would incur total costs of £585,000 within its current operations. Based on the estimated market price of £900,000, this would result in an overall profit of £315,000. Consequently, the profit allowance to be made for the completing and selling effort would be £100,000 (being $£315,000 \times £185,000 \div £585,000$). On this basis, the fair value of the work in progress would be £615,000 (being $£900,000 - £185,000 - £100,000$).

3.7.4.D Financial instruments

Financial instruments traded in an active market must be valued at their quoted price, which is usually the current bid price.

When unadjusted quoted prices are unavailable, the price of a recent orderly transaction between market participants for an identical or comparable asset or liability is used. However, this price might not be a good estimate of fair value if there has been a significant change in economic circumstances or a significant period of time between the date of transaction and the measurement date.

If fair values established using the above methodologies are not available or not reliable, an entity estimates the fair value by using another valuation technique, with the objective of estimating the price at which an orderly transaction to sell an asset or to transfer a liability would take place between market participants at the measurement date. *[FRS 102.2A.15]*.

The fair value of a liability reflects the effect of non-performance risk (including but not limited to the acquirer's own credit risk), which is assumed to be the same before and after the transfer of the liability. *[FRS 102.2A.13, FRS 102 Appendix I]*. The fair value of a financial liability that is due on demand is not less than the amount payable on demand, discounted from the first date that the amount could be required to be paid. *[FRS 102.2A.14]*.

Further guidance on these concepts is provided in Chapter 10 at 4.9.3, which addresses Section 2A.

Under the above guidance, receivables would likely be valued based on the present values of the amounts to be received, determined at appropriate interest rates, less allowances for collectability and collection costs, if necessary. As receivables are recognised and measured at fair value at the acquisition date, any uncertainty about collections and future cash flows are included in the fair value measure - and therefore, the acquirer does not recognise a separate provision or valuation allowance. In other words, an acquirer cannot 'carry over' any provision or valuation allowance already recognised by the acquiree. Generally, discounting is not required for short-term receivables, beneficial contracts and other identifiable assets when the difference between the nominal and discounted amounts is not material.

Similarly, accounts and notes payable, long-term debt, liabilities, accruals and other claims payable would likely be valued using the present values of amounts to be disbursed in settling the liabilities determined at appropriate interest rates. Again, discounting is not generally required for short-term liabilities when the difference between the nominal and discounted amounts is not material.

3.7.4.E Investments in an associate or jointly controlled entity

Where one of the identified assets is an investment in an associate or a jointly controlled entity, the fair value must be determined for the investment in associate or jointly controlled entity as whole, rather than calculating a fair value based on the appropriate share of the fair values of the identifiable assets, liabilities and contingent liabilities of the associate or jointly controlled entity. See Chapter 10 at 4.10.1 for discussion on fair valuing large holdings of a financial instrument. By doing so, any goodwill relating to the associate or jointly controlled entity is subsumed within the carrying amount of the associate or jointly controlled entity rather than within the goodwill arising on the overall business combination. Nevertheless, although this fair value is effectively the 'cost' to the group to which equity accounting is applied, the underlying fair values of the identifiable assets, liabilities and contingent liabilities also need to be determined to apply equity accounting (see Chapter 17 at 3.2.2).

If the fair value exercise results in an excess of assets over the fair value of the consideration (commonly referred to as 'negative goodwill'), in accordance with the requirements discussed at 3.9.3 below, the acquirer is required to challenge the fair value placed on the associate or jointly controlled entity as it re-challenges the values placed on all of the assets, liabilities and contingent liabilities of the acquiree to ensure that the value has not been overstated. *[FRS 102.14.8(c), FRS 102.19.24(a)]*.

3.7.4.F Onerous contracts

A provision for an onerous contract, that would be recognised under Section 21 by the acquiree at the acquisition date, must be recognised and measured at its fair value on allocation of the cost of the business combination.

An onerous contract is one in which the "unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it." The unavoidable costs under a contract reflect the "least net cost of exiting from the contract, which is the lower of the cost of fulfilling it and any compensation or penalties arising from failure to fulfil it." The cost of fulfilling a contract is, "the incremental costs of fulfilling that contract and an allocation of other costs that relate directly to fulfilling contracts." *[FRS 102.21A.2]*. Therefore, an onerous contract is a contract that is directly loss-making, not

simply uneconomic by reference to current prices. However, in allocating the cost of a business combination, the acquirer must go further than considering only onerous contracts that are directly loss-making.

How we see it

We believe that contracts that are 'onerous' by reference to market conditions at the date of acquisition must be recognised as liabilities. This is consistent with the requirements for intangible assets.

How we see it

In addition to contracts which are onerous, in allocating the cost of a business combination to the assets acquired, liabilities and contingent liabilities assumed, we consider that favourable contracts must be recognised as intangible assets and unfavourable contracts recognised as liabilities.

An acquiree might hold an investment property subject to operating leases with a tenant on off-market terms for a fixed period. The fair value of a non-financial asset (such as investment property) would take into account the existence of these off-market leases. The fair value of the off-market leases would not be separately identified as an intangible asset or onerous contract. A similar issue is specifically addressed in IFRS 3. [IFRS 3.B42].

3.7.4.G Contingent liabilities

No specific guidance is included in FRS 102 in determining the fair value of a contingent liability. Its fair value would be based on the amount that a third party would charge to assume those contingent liabilities. This amount would reflect all expectations about possible cash flows and not the single most likely or the expected maximum or minimum cash flow. Many contingent liabilities are so defined because it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation - even though the minimum cash flow may be zero, a third party would still charge a sum to assume the contingent liability.

3.7.5 Subsequent adjustments to fair values

If the initial accounting for a business combination is incomplete by the end of the reporting period in which the combination occurs, the acquirer must recognise provisional amounts for the items for which the accounting is incomplete. Within twelve months of the acquisition date, the acquirer must retrospectively adjust the provisional amounts recognised as assets and liabilities at the acquisition date to reflect new information obtained about any relevant facts and circumstances that existed at the acquisition date, i.e., the adjustments are accounted for as if they were made at the acquisition date. Any adjustments will impact the amount of goodwill (or negative goodwill) recognised. [FRS 102.19.19].

How we see it

Paragraph 19.19 of FRS 102 refers to the initial accounting being 'incomplete by the end of the reporting period' and the acquirer reporting 'provisional amounts for the items for which the accounting is incomplete'. This means that the initial accounting is incomplete at the date at which the financial statements for that period are authorised for issue. Thus, any items that are finalised up to the date the financial statements were authorised for issue must be reflected in the initial accounting, providing this is within the twelve-month period allowed.

Therefore, FRS 102 requires the allocation of the cost of the business combination to be completed within twelve months of the acquisition date. Where, as a result of completing the initial accounting, adjustments to the provisional values are identified, FRS 102 requires them to be recognised from the acquisition date. Although not explicitly stated in FRS 102, this means that:

- The carrying amount of the identifiable asset, liability or contingent liability that is recognised or adjusted as a result of completing the initial accounting is calculated as if its fair value at the acquisition date had been recognised from that date.
- And
- Comparative information presented for the periods before the initial accounting for the combination is complete is presented as if the initial accounting had been completed from the acquisition date. This includes any additional depreciation, amortisation or other profit or loss effect recognised as a result of completing the initial accounting.

These requirements are illustrated in the following example (note that the deferred tax implications have been ignored).

Illustration 3-15: Finalisation of provisional values upon completion of initial accounting

Entity A prepares financial statements for annual periods ending on 31 December 20X6. Entity A acquired Entity B on 30 September 20X6, in relation to which it sought an independent appraisal for an item of property, plant and equipment acquired in the combination. However, the appraisal was not finalised by the time Entity A completed its 20X6 annual financial statements in which it recognised a provisional fair value for the asset of £30,000, and a provisional value for acquired goodwill of £100,000. The item of property, plant and equipment had a remaining useful life at the acquisition date of five years. Goodwill is amortised over its useful life of 10 years.

Six months after the acquisition date, Entity A received the independent appraisal, which estimated the asset's fair value at the acquisition date at £40,000.

In preparing its 20X7 financial statements, Entity A is required to recognise any adjustments to provisional values as a result of completing the initial accounting from the acquisition date.

An adjustment is made to the carrying amount of the item of property, plant and equipment, measured as the fair value adjustment at the acquisition date of £10,000, less the additional depreciation that would have been recognised had the asset's fair value at the acquisition date been recognised from that date (£500 for three months' depreciation to 31 December 20X6), i.e., an increase of £9,500.

The carrying amount of goodwill is adjusted to reflect the increase in value of the asset at the acquisition date of £10,000. The decrease in goodwill will be net of £250 being the reduced amortisation charge for the three months to 31 December 20X6, i.e., a decrease of £9,750.

20X6 comparative information is to be restated to reflect these adjustments. Accordingly, the 20X6 balance sheet is restated by increasing the carrying amount of property, plant and equipment by £9,500, reducing goodwill by £9,750 and reducing retained earnings by £250. The 20X6 income statement is restated to include additional depreciation of £500 and a reduction in amortisation of goodwill of £250.

Per the disclosure requirements of paragraph 19.25B of FRS 102, Entity A would disclose in its 20X6 financial statements that the initial accounting for the business combination has been determined only provisionally and specify the line items for which provisional amounts have been recognised.

While FRS 102 does not specifically mandate disclosures in the subsequent financial statements, we consider it appropriate that in its 20X7 financial statements it would disclose the amounts and explanations of the adjustments to the provisional values recognised during the current reporting period as it is required by paragraph 7 of Schedule 1 and paragraph 1(1) of Schedule 6 to the Regulations. Therefore, Entity A would disclose that:

- The fair value of the item of property, plant and equipment at the acquisition date has been increased by £10,000 with a corresponding decrease in goodwill.
- And
- The 20X6 comparative information is restated to reflect this adjustment, including additional depreciation of £500 and reduced amortisation of goodwill of £250 relating to the year ended 31 December 20X6.

The above Illustration shows a situation where a provisional value of an asset was finalised at a different amount as part of the completion of the initial accounting. By contrast, the following Illustration shows the identification of a new asset as a result of finalising the business combination accounting.

Illustration 3-16: Identification of an asset upon completion of initial accounting

Entity C prepares financial statements for annual periods ending on 31 December 20X6. Entity C acquired Entity D on 30 November 20X6. Entity C engaged an independent appraiser to assist with the identification and determination of fair values to be assigned to the acquiree's assets, liabilities and contingent liabilities and the cost of the business combination. However, the appraisal was not finalised by the time Entity C completed its 20X6 annual financial statements, and therefore the amounts recognised in its 20X6 annual financial statements were on a provisional basis.

As part of the work carried out in finalising the initial accounting, it was identified by the independent appraiser that Entity D had an intangible asset (meeting all of Section 18's recognition and identification criteria) with a fair value at the date of acquisition of £20,000. However, this had not been identified at the time when Entity C was preparing its 20X6 annual financial statements. Thus, no value had been included for this intangible asset.

In preparing its 20X7 financial statements, Entity C is required to recognise any adjustments to provisional values as a result of completing the initial accounting from the acquisition date. In this case, no value had been recognised, and indeed, the intangible asset had not been identified at the time of preparing its 20X6 financial statements. So, can an adjustment be made under the provisions of paragraph 19.19 of FRS 102?

The requirements are not limited to measurement adjustments. Adjustments to recognise subsequently identified assets or liabilities are permitted as a result of completing the initial accounting. The initial accounting involves the identification as well as the measurement of the acquiree's assets, liabilities and contingent liabilities. Therefore, in its financial statements for the year ended 31 December 20X7, Entity C retrospectively adjusts the prior year information to reflect the recognition of this intangible asset.

It is important that any adjustments to the provisional allocation reflect conditions as they existed at the date of the acquisition, rather than being affected by subsequent events; the objective is to determine the fair values of the items at the date of acquisition. There is a parallel to be drawn here with the accounting treatment of events subsequent to the balance sheet date. Only those events which provide further evidence of conditions as they existed at the acquisition date must be taken into account.

Beyond twelve months after the acquisition date, adjustments to reflect new information obtained about any relevant facts and circumstances that existed at the acquisition date must be accounted for prospectively, except that adjustments to the initial accounting for a business combination are to be recognised only to correct a material error in accordance with Section 10. [FRS 102.19.19].

Section 10 requires an entity, to the extent practicable, to correct a material error retrospectively and to restate the comparative information for the prior period(s) in which the error occurred. [FRS 102.10.21]. The accounting is similar to that outlined above for adjustments upon completion of initial accounting. The only difference being that there is no time limit as to when such adjustments may be required. Section 10 also has specific disclosure requirements in respect of material prior period errors (see Chapter 9 at 3.6.3). [FRS 102.10.23].

Adjustments to the initial accounting for a business combination after it is complete are not made for the effect of changes in estimates. In accordance with Section 10, the effect of a change in estimate is recognised in the current and future periods (see Chapter 9 at 3.4). [FRS 102.10.15, FRS 102.10.16, FRS 102.10.17].

3.8 Non-controlling interests

A non-controlling interest is the equity in a subsidiary not attributable, directly or indirectly, to a parent. [FRS 102 Appendix I, FRS 102.19.14A].

Extract from FRS 102

19.14A At the acquisition date, any non-controlling interest in the acquiree is stated at the non-controlling interest's share of the net amount of the identifiable assets, liabilities and provisions for contingent liabilities so recognised.

Consequently, where the acquirer obtains less than a 100% equity interest in the acquiree, a non-controlling interest in the acquiree is recognised reflecting the non-controlling interest's proportion of the net identifiable assets, liabilities and contingent liabilities of the acquiree at their attributed fair values at the date of acquisition; no amount is included for any goodwill relating to the non-controlling interests. There is no option under FRS 102 to measure non-controlling interests at fair value.

FRS 102 does not distinguish between non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of liquidation and other components of non-controlling interests (e.g., perpetual debt classified as equity under Section 22).

How we see it

The implication is that all non-controlling interests are measured in the same way based on present ownership interest. This means that any non-controlling interests, such as options, are valued at nil if they are not entitled to a present ownership interest.

The measurement of non-controlling interests in a business combination is illustrated in Illustration 3-17 below.

Illustration 3-17: Initial measurement of non-controlling interest in a business combination

Parent A acquires 80% of the ordinary shares of Target B for £95m in cash. The fair value of Target B's identifiable net assets is £85m. The impact of the business combination, and the measurement of non-controlling interest, is as follows:

	Dr	Cr
	£m	£m
Fair value of identifiable net assets	85	
Goodwill (£95m - (80% × £85m))	27	
Cash		95
Non-controlling interest (20% × £85m)		17

The ordinary shares are present ownership interests and entitle their holders to a proportionate share of the Target B's net assets in the event of liquidation. They are measured at the non-controlling interest's proportionate share of the identifiable net assets of Target B.

Further discussion on the accounting and presentation of non-controlling interests can be found in Chapter 8 at 3.7.

3.8.1 Call and put options over non-controlling interests

In some business combinations when less than 100% of the equity shares are acquired, the transaction might also involve options over some or all of the outstanding shares held by the non-controlling shareholders. The acquirer could hold a call option, i.e., a right to acquire the outstanding shares at a future date for cash at a particular price. Alternatively, it could have granted a put option to the other shareholders whereby they have the right to sell their shares to the acquirer at a future date for cash at a particular price. In some cases, there could be a combination of call and put options, the terms of which might be equivalent or might differ.

Those kinds of transactions raise many questions regarding the appropriate accounting treatment such as whether the parent has a present ownership interest in the shares subject to the call and/or put options, whether non-controlling interest is recognised, how put and/or call options are classified and whether the transactions are accounted for as a single arrangement. In some cases, put and/or call options are subject to employment conditions and could, in whole or in part, constitute an employee benefit (accounted under Section 28 - see Chapter 30) or a share-based payment arrangement (accounted under Section 26 - see Chapter 28). Section 19 gives no guidance as to how such options impact the accounting for a business combination. Those issues are discussed in Chapter 8 at 3.7.2.

3.9 Goodwill

FRS 102 defines 'goodwill' in terms of its nature, rather than in terms of its measurement. It is defined as: "Future economic benefits arising from assets that are not capable of being individually identified and separately recognised". [FRS 102 Appendix I].

Section 19 addresses accounting for goodwill both at the time of a business combination and subsequently. [FRS 102.19.14, FRS 102.19.22, FRS 102.19.23].

3.9.1 Initial recognition

Extract from FRS 102

- 19.22** The acquirer shall, at the acquisition date:
- (a) recognise goodwill acquired in a business combination as an asset; and
 - (b) initially measure that goodwill as its cost, being the excess of the cost of the business combination over the acquirer's interest in the net amount of the identifiable assets, liabilities and contingent liabilities recognised and measured in accordance with paragraphs 19.15 to 19.15C.

Section 19 requires that an acquirer, at the acquisition date, recognises goodwill acquired in a business combination as an asset. However, rather than attributing a fair value to the goodwill directly, the initial measurement of goodwill is required to be its cost, being the excess of the cost of the business combination over the acquirer's interest in the net amount of the identifiable assets, liabilities and contingent liabilities recognised and measured in accordance with Section 19's requirements. [FRS 102.19.14, FRS 102.19.22]. Thus, as discussed at 3.8 above, no amount is included for any goodwill relating to the non-controlling interests.

The cost of a business combination is the aggregate of the acquisition-date fair values of assets given, liabilities incurred or assumed, and any equity instruments issued by the acquirer, in exchange for control of the acquiree plus any directly attributable costs (see 3.6 above). [FRS 102.19.11].

Where the acquirer's interest in the net amount of the identifiable assets, liabilities and provisions for contingent liabilities exceeds the cost of the business combination, Section 19 regards this as giving rise to negative goodwill. [FRS 102.19.24]. Negative goodwill is discussed further in 3.9.3 below.

3.9.2 Subsequent measurement of goodwill

After initial recognition, an acquirer measures goodwill acquired in a business combination at cost less accumulated amortisation and accumulated impairment losses. [FRS 102.19.23]. Section 19 defers to Section 18 and Section 27 for the detailed requirements in relation to amortisation and impairment, respectively. Section 19 requires that goodwill is to be amortised on a systematic basis over a finite useful life following the principles of paragraphs 19 to 24 of Section 18, and that Section 27 is to be followed for recognising and measuring any impairment of goodwill. [FRS 102.19.23].

However, Section 19 states that: "If, in exceptional cases, an entity is unable to make a reliable estimate of the useful life of goodwill, the life shall not exceed 10 years". [FRS 102.19.23(a)]. This is consistent with UK company law. [1 Sch 22].

The useful life of goodwill is required to be disclosed. If the useful life of goodwill cannot be reliably estimated, disclosure must be made of the reasons supporting the period chosen (which cannot exceed 10 years). [FRS 102.19.25(g)].

See Chapter 21 at 3.3.3.A and Chapter 29 for further discussion of the requirements of Sections 18 and 27 regarding estimating the useful life, and impairment, respectively.

3.9.3 Excess over cost of acquirer's interest in the net fair value of acquiree's identifiable assets, liabilities and contingent liabilities (negative goodwill)

Extract from FRS 102

Excess over cost of acquirer's interest in the net fair value of acquiree's identifiable assets, liabilities and contingent liabilities

- 19.24** If the acquirer's interest in the net amount of the identifiable assets, liabilities and provisions for contingent liabilities recognised in accordance with paragraph 19.14 exceeds the cost of the business combination (also referred to as 'negative goodwill'), the acquirer shall:
- Reassess the identification and measurement of the acquiree's assets, liabilities and provisions for contingent liabilities and the measurement of the cost of the combination.
 - Recognise and separately disclose the resulting excess on the face of the statement of financial position on the acquisition date, immediately below goodwill, and followed by a subtotal of the net amount of goodwill and the excess.
 - Recognise subsequently the excess up to the fair value of non-monetary assets acquired in profit or loss in the periods in which the non-monetary assets are recovered. Any excess exceeding the fair value of non-monetary assets acquired shall be recognised in profit or loss in the periods expected to be benefited.

In some business combinations, the acquirer's interest in the net fair value of the acquiree's identifiable assets, liabilities and contingent liabilities exceeds the cost of the combination. That excess is commonly referred to as 'negative goodwill'.

Where such an excess arises, Section 19 requires the acquirer to reassess the identification and measurement of the acquiree's identifiable assets, liabilities and contingent liabilities and the measurement of the cost of the combination. [FRS 102.19.24(a)].

Having undertaken that reassessment, any excess remaining after that reassessment is then required to be recognised and separately disclosed on the face of the statement of financial position, immediately below goodwill, and followed by a subtotal of the net amount of goodwill and the excess (i.e., negative goodwill). [FRS 102.19.24(b)].

Following initial recognition on the statement of financial position, negative goodwill up to the fair value of the non-monetary assets acquired is recognised in profit or loss in the periods in which the non-monetary assets are recovered. [FRS 102.19.24(c)].

How we see it

When the excess is less than the fair value of the non-monetary assets acquired, FRS 102 does not specify whether to allocate negative goodwill to non-monetary assets on a pro rata basis or to specific assets. This determination will lead to different profiles of amortisation.

For example, since inventories are usually turned over relatively quickly, any negative goodwill up to the fair value of the inventories (or allocated on the basis of the fair value of the inventories) may be released to the profit and loss account over a short period following the acquisition.

How we see it

Any negative goodwill in excess of the fair values of non-monetary assets acquired must be released in the periods expected to benefit. The exact meaning of this wording is not completely clear, but any reasonable interpretation is likely to be acceptable.

The periods in which the excess will be recognised in profit or loss must be disclosed. [FRS 102.19.25(h)].

3.10 Reverse acquisitions

In some business combinations, commonly referred to as reverse acquisitions, the acquirer is the entity whose equity interests have been acquired and the issuing entity is the acquiree (see 3.4.1 above). The legal subsidiary is the acquirer if it has control, i.e., the power to govern the financial and operating policies of the legal parent so as to obtain benefits from its activities [FRS 102.19.8, FRS 102.19.9, FRS 102 Appendix I]. See 3.4 above for further discussion on identifying the acquirer.

A reverse acquisition generally occurs when the owners of a company being 'acquired' (Company B) receive as consideration sufficient voting shares of the 'acquiring company' (Company A) so as to obtain control over the new combined entity. The acquisition is 'reverse' because, from an economic point of view, the acquirer (Company A) is being taken over by the acquiree (Company B).

Since the CA 2006 regards Company A as being the parent undertaking of Company B, it requires Company A to prepare consolidated financial statements. In preparing those consolidated financial statements, Company A is required to acquisition account for the acquisition of its subsidiary undertaking, Company B. [6 Sch 9].

In these circumstances, as Company B obtains control of Company A, and is therefore the acquirer under FRS 102, Company A is deemed to have been acquired by Company B and reverse acquisition accounting must be applied.

To adopt reverse acquisition accounting represents a departure from company law which does not envisage such occurrence. Such departure (a 'true and fair override') is required to the extent necessary for the financial statements to give a true and fair view. In such circumstances, there must be disclosure of the departure from the CA 2006, including the particulars, reasons and effect. [s404(5)].

In the absence of guidance within FRS 102, the discussion that follows is based on the guidance in IFRS 3. [IFRS 3.B19-IFRS 3.B27].

3.10.1 Measuring the cost of the business combination

In a reverse acquisition, the accounting acquirer usually issues no consideration for the accounting acquiree; equity shares are issued to the owners of the accounting acquirer (i.e., the legal subsidiary) by the accounting acquiree (i.e., the legal parent). In a reverse acquisition, the cost of the business combination is deemed to have been incurred by the legal subsidiary in the form of equity instruments issued to the owners of the legal parent. The cost of the combination is based on the number of equity instruments the legal subsidiary would have had to issue to provide the same percentage ownership interest of the combined entity to the owners of the legal parent as they have in the combined entity as a result of the reverse acquisition. The fair value of the number of equity instruments so calculated is used as the cost of the combination.

If the fair value of the equity instruments of the legal parent is used as the basis for determining the cost of the combination, it is the acquisition-date fair value of the acquiree's equity interests that is used, which is the total fair value of all the issued equity instruments of the legal parent before the business combination. This might be the case, for example, where the fair value of the legal parent's equity shares is more reliably measured.

Illustration 3-18: Reverse acquisition - calculating the cost of the business combination using the fair value of the equity shares of the legal subsidiary

Entity A, the entity issuing equity instruments and therefore the legal parent, is acquired in a reverse acquisition by Entity B, the legal subsidiary, on 30 September 20X6. The accounting for any income tax effects is ignored.

Balance sheets of Entity A and Entity B immediately before the business combination are:

	<i>Entity A</i>	<i>Entity B</i>
	£	£
Tangible fixed assets	1,300	3,000
Debtors	500	700
	<u>1,800</u>	<u>3,700</u>
Creditors: amounts falling due within one year	300	600
Creditors: amounts falling due after more than one year	400	1,100
	<u>700</u>	<u>1,700</u>
Net assets	<u>1,100</u>	<u>2,000</u>
Capital and reserves		
Called up share capital		
100 £1 ordinary shares	100	
60 £1 ordinary shares		60
Share premium account	200	540
Profit and loss account	800	1,400
	<u>1,100</u>	<u>2,000</u>

On 30 September 20X6, Entity A issues 2.5 shares in exchange for each ordinary share of Entity B. All of Entity B's shareholders exchange their shares in Entity B. Therefore, Entity A issues 150 ordinary shares in exchange for all 60 ordinary shares of Entity B and so has 250 issued shares in total.

The fair value of each ordinary share of Entity B at 30 September 20X6 is £40. The quoted market price of Entity A's ordinary shares at that date is £16.

The fair values of Entity A's identifiable assets and liabilities at 30 September 20X6 are the same as their carrying amounts, with the exception of tangible fixed assets. The fair value of Entity A's tangible fixed assets at 30 September 20X6 is £1,500. (For the purposes of illustration, deferred tax implications have been ignored.) Therefore, the fair value of Entity A's net assets is £1,300 (£1,100 plus £200).

As a result of the issue of 150 ordinary shares by Entity A, Entity B's shareholders own 60% of the issued shares of the combined entity (i.e., 150 shares out of 250 issued shares). The remaining 40% is owned by Entity A's shareholders. If the business combination had taken place in the form of Entity B issuing additional ordinary shares to Entity A's shareholders in exchange for their ordinary shares in Entity A, Entity B would have had to issue 40 shares for the ratio of ownership interest in the combined entity to be the same. Entity B's shareholders would then own 60 out of the 100 issued shares of Entity B and therefore 60% of the combined entity.

As a result, the cost of the business combination is £1,600 (i.e., 40 shares each with a fair value of £40). In this example, this is the same as calculated using the quoted market price of Entity A's shares (100 shares with a fair value per share of £16, i.e., £1,600).

In some circumstances, the combination may be effected whereby some of the consideration given by the legal acquirer to acquire the shares in the legal acquiree is cash. This is dealt with in more detail in the latest edition of the EY publication, International GAAP®.

3.10.2 Preparation and presentation of consolidated financial statements

Since the legal parent is the acquiree for accounting purposes, the consolidated financial statements prepared following a reverse acquisition reflect the fair values of the assets, liabilities and contingent liabilities of the legal parent, not those of the legal subsidiary. Therefore, the cost of the business combination is allocated by measuring the identifiable assets, liabilities and contingent liabilities of the legal parent that satisfy the recognition criteria at their fair values at the acquisition date. Any excess of the cost of the combination over the acquirer's interest in the net fair value of those items is then accounted for as goodwill.

In Illustration 3-18 above, goodwill of £300 would be calculated as the difference between the cost of the business combination of £1,600 and the fair value of the assets acquired of £1,300.

Although the accounting for a reverse acquisition reflects the legal subsidiary as being the acquirer, the consolidated financial statements prepared following a reverse acquisition are issued under the name of the legal parent (accounting acquiree). Consequently, they have to be described in the notes as a continuation of the financial statements of the legal subsidiary (accounting acquirer), with one adjustment, which is to adjust retrospectively the accounting acquirer's legal capital to reflect the legal capital of the accounting acquiree. Comparative information presented in those consolidated financial statements is therefore that of the legal subsidiary (accounting acquirer) - not that originally presented in the financial statements of the legal parent (accounting acquiree) - but is adjusted to reflect the legal capital of the legal parent (accounting acquiree).

Because the consolidated financial statements represent the continuation of the financial statements of the legal subsidiary except for its capital structure:

- The assets and liabilities of the legal subsidiary (accounting acquirer) are recognised and measured at their pre-combination carrying amounts, i.e., not at their acquisition-date fair values.
- The assets and liabilities of the legal parent (accounting acquiree) are recognised and measured in accordance with Section 19, i.e., generally at their acquisition-date fair values.
- The retained earnings and other equity balances reflect those of the legal subsidiary (accounting acquirer) before the business combination, i.e., not those of the legal parent (accounting acquiree).
- The amount recognised as issued equity interests in the consolidated financial statements is determined by adding the issued equity interest of the legal subsidiary (accounting acquirer) outstanding immediately before the business combination to the fair value of the consideration transferred by the accounting acquirer - see 3.10.1 above. However, the equity structure (i.e., the number and type of equity interests issued) reflects the equity structure of the legal parent (accounting acquiree), including the equity interests the legal parent issued to effect the combination. Accordingly, the equity structure of the legal subsidiary (accounting acquirer) is restated using the exchange ratio established in the acquisition agreement to reflect the number of shares of the legal parent (accounting acquiree) issued in the reverse acquisition.
- The non-controlling interest reflects any non-controlling interest's proportionate share of the legal subsidiary's (accounting acquirer's) pre-combination carrying amounts of retained earnings and other equity interests (as discussed at 3.10.3 below).

And

- The income statement for the current period reflects that of the legal subsidiary (accounting acquirer) for the full period together with the post-acquisition results of the legal parent (accounting acquiree) based on the attributed fair values.

Illustration 3-19: Reverse acquisition - consolidated balance sheet at date of the business combination

If we consider the transaction in Illustration 3-18 above with the cost of consideration of £1,600, the consolidation at the date of the business combination would be as follows, using the guidance in IFRS 3. As discussed below and shown in Illustration 3-18, additional adjustments would be required to equity for a UK company.

	Entity A	Entity B	Consolidation adjustments	Consolidated
	£	£	£	£
Tangible fixed assets	1,300	3,000	200 ¹	4,500
Goodwill	-	-	300 ²	300
Debtors	500	700	-	1,200
	<u>1,800</u>	<u>3,700</u>	<u>500</u>	<u>6,000</u>
Creditors: amounts falling due within one year	300	600	-	900
Creditors: amounts falling due after more than one year	400	1,100	-	1,500
	<u>700</u>	<u>1,700</u>	<u>-</u>	<u>2,400</u>
Net assets	<u>1,100</u>	<u>2,000</u>	<u>500</u>	<u>3,600</u>
Capital and reserves				
Called up share capital				
100 £1 ordinary shares	100	-	(100) ³	-
60 £1 ordinary shares	-	60	1,600 ³	1,660
Share premium account	200	540	(200) ³	540
Issued equity	<u>300</u>	<u>600</u>	<u>1,300</u>	<u>2,200</u>
Profit and loss account	800	1,400	(800) ³	1,400
	<u>1,100</u>	<u>2,000</u>	<u>500</u>	<u>3,600</u>

¹ To recognise Entity A's tangible fixed assets at their fair value at the acquisition date.

² To recognise goodwill on consolidation, representing the difference between the cost of the combination, £1,600, and the fair value of Entity A's net assets acquired, £1,300.

³ To recognise the cost of the acquisition and to eliminate Entity A's share capital and reserves as at the date of the acquisition.

The equity as shown above would require further adjustment in a UK company. As stated above, the amount of share capital in the consolidated balance sheet does not equal the nominal value of either Entity B's share capital (£60) or that of Entity A following the acquisition (£250). Although the total share capital and share premium (issued equity) in the consolidated balance sheet of £2,200 is equivalent to the total as it would have been if Entity B had been the legal acquirer, the equity structure (i.e., the number and type of equity instruments issued) must reflect that of the legal parent and in a UK GAAP context, the amounts for share capital and related reserves, such as share premium, in the consolidated financial statements must also reflect the legal position. On this basis, a reserve, often called a 'reverse acquisition reserve' would be reflected as illustrated below.

For FRS 102 entities applying IAS 33 *Earnings per Share* there is further guidance in IFRS 3 on disclosure of earnings per share in reverse acquisitions. [IFRS 3.B25, IFRS 3.B26, IFRS 3.B27].

Illustration 3-20: Reverse acquisition - recognition of a reverse acquisition reserve

	Entity A	Entity B	Consolidation adjustments	Consolidated
	£	£	£	£
Tangible fixed assets	1,300	3,000	200 ¹	4,500
Goodwill			300 ²	300
Debtors	500	700	-	1,200
	1,800	3,700	500	6,000
Creditors: amounts falling due within one year	300	600	-	900
Creditors: amounts falling due after one year	400	1,100	-	1,500
	700	1,700	-	2,400
Net assets	1,100	2,000	500	3,600
Capital and reserves				
Called up share capital				
100 £1 ordinary shares	100	-	150 ³	250
60 £1 ordinary shares	-	60	(60) ⁴	-
Share premium account	200	540	(540) ⁴	200
Reverse acquisition reserve	-	-	1,750	1,750
Profit and loss account	800	1,400	(800) ⁵	1,400
	1,100	2,000	500	3,600

¹ To recognise Entity A's tangible fixed assets at their fair value at the acquisition date.

² To recognise goodwill on consolidation, representing the difference between the cost of the combination, £1,600, and the fair value of Entity A's net assets acquired, £1,300.

³ To recognise the nominal value of the shares issued by Entity A on the acquisition. Merger relief applies and so no share premium has been recognised on the transaction.

⁴ To eliminate the share capital and share premium of Entity B (as the capital reserves on this basis reflect those of the legal acquirer).

⁵ To eliminate the profit and loss reserves of Entity A.

3.10.3 Non-controlling interests

In some reverse acquisitions, some of the owners of the legal subsidiary (accounting acquirer) might not exchange their equity interests for equity interests of the legal parent (accounting acquiree) but retain their interest in the equity instruments of the legal subsidiary. Those owners are treated as a non-controlling interest in the consolidated financial statements after the reverse acquisition. That is because the owners of the legal subsidiary that do not exchange their equity interests for equity interests of the legal acquirer have an interest in only the results and net assets of the legal subsidiary - not in the results and net assets of the combined entity. Conversely, even though the legal parent is the acquiree for accounting purposes, the owners of the legal parent have an interest in the results and net assets of the combined entity.

The assets and liabilities of the legal subsidiary are measured and recognised in the consolidated financial statements at their pre-combination carrying amounts. Therefore, in a reverse acquisition, the non-controlling interest reflects the non-controlling shareholders' proportionate interest in the pre-combination carrying amounts of the legal subsidiary's net assets. These requirements are shown in the following Illustration.

Illustration 3-21: Reverse acquisition - non-controlling interests

This example uses the same facts in Illustration 3-18 above, except that in this case only 56 of Entity B's ordinary shares are tendered for exchange rather than all 60. Because Entity A issues 2.5 shares in exchange for each ordinary share of Entity B, Entity A issues only 140 (rather than 150) shares. As a result, Entity B's shareholders own 58.3% of the issued shares of the combined entity (i.e., 140 shares out of 240 issued shares).

As in Illustration 3-18 above, the cost of the business combination is calculated by assuming that the combination had taken place in the form of Entity B issuing additional ordinary shares to the shareholders of Entity A in exchange for their ordinary shares in Entity A. In calculating the number of shares that would have to be issued by Entity B, the non-controlling interest is ignored. The majority shareholders own 56 shares of Entity B. For this to represent a 58.3% ownership interest, Entity B would have had to issue an additional 40 shares. The majority shareholders would then own 56 out of the 96 issued shares of Entity B and therefore 58.3% of the combined entity.

As a result, the cost of the business combination is £1,600 (i.e., 40 shares each with a fair value of £40). This is the same amount as when all 60 of Entity B's ordinary shares are tendered for exchange (see Illustration 3-18 above). The cost of the business combination does not change simply because some of Entity B's shareholders do not participate in the exchange.

The non-controlling interest is represented by the 4 shares of the total 60 shares of Entity B that are not exchanged for shares of Entity A. Therefore, the non-controlling interest is 6.7%. The non-controlling interest reflects the non-controlling shareholders' proportionate interest in the pre-combination carrying amounts of the net assets of the legal subsidiary. Therefore, the consolidated balance sheet is adjusted to show a non-controlling interest of 6.7% of the pre-combination carrying amounts of Entity B's net assets (i.e., £134 or 6.7% of £2,000).

The consolidated balance sheet at 30 September 20X6 (the date of the business combination) reflecting the non-controlling interest is as follows (the intermediate columns for Entity B, non-controlling interest (NCI), Entity A and UK legal capital adjustments are included to show the workings):

	Entity B	NCI ¹	Entity A	UK legal capital adjustments ²	Consolidated
	Book values		Fair values		
	£	£	£	£	£
Tangible fixed assets	3,000		1,500	-	4,500
Debtors	700		500	-	1,200
Goodwill	-		300	-	300
	<u>3,700</u>		<u>2,300</u>	<u>-</u>	<u>6,000</u>
Creditors: amounts falling due within one year	600		300	-	900
Creditors: amounts falling due after one year	1,100		400	-	1,500
	<u>1,700</u>		<u>700</u>	<u>-</u>	<u>2,400</u>
Net assets	<u>2,000</u>		<u>1,600</u>	<u>-</u>	<u>3,600</u>
Capital and reserves					
Called up share capital					
240 £1 ordinary shares (Entity A)	60	(4)	1,600	(1,416)	240
Share premium account	540	(36)		(304)	200
Profit and loss account	1,400	(94)	-	-	1,306
Non-controlling interest	-	134	-	-	134
Reverse acquisition reserve	-	-	-	1,720	1,720
	<u>2,000</u>		<u>1,600</u>	<u>-</u>	<u>3,600</u>

¹ The non-controlling interest of £134 has two components. The first component is the reclassification of the non-controlling interest's share of the accounting acquirer's retained earnings immediately before the acquisition (£1,400 × 6.7% or £94). The second component represents the reclassification of the non-controlling interest's share of the accounting acquirer's issued equity (£600 × 6.7% or £40).

² A UK company makes adjustments to present the share capital structure of the legal parent, Entity A, with an equivalent entry to reverse acquisition reserve.

3.11 Business combinations achieved in stages (step acquisitions)

So far, this chapter has discussed business combinations which result from a single purchase transaction. However, in practice, some subsidiaries are acquired in a series of steps which take place over an extended period, during which the underlying value of the interest is likely to change, both because of the trading profits (or losses) which it retains and because of other movements in the fair value of its assets and liabilities. This raises questions regarding how to determine the cost of the business combination, allocating that cost to the assets acquired and liabilities and provisions for contingent liabilities assumed, and the resulting goodwill.

Extract from FRS 102

19.11A Where control is achieved following a series of transactions, the cost of the business combination is the aggregate of the fair values of the assets given, liabilities assumed and equity instruments issued by the acquirer at the date of each transaction in the series.

Where a parent acquires control of a subsidiary in stages, FRS 102 requires the transaction to be accounted for in accordance with paragraphs 19.11A and 19.14, applied at the date control is achieved. [FRS 102.9.19B]. Accordingly:

- The cost of the business combination is the aggregate of the fair values of the assets given, liabilities incurred or assumed, and equity instruments issued by the acquirer at the date of each transaction in the series. [FRS 102.19.11A].
And
- The normal rules on allocation of the cost of the business combination under the purchase method apply whereby: "The acquirer shall, *at the acquisition date*, allocate the cost of a business combination by recognising the acquiree's identifiable assets, liabilities and provisions for its contingent liabilities ... *at their fair values at that date*, except for the items specified in paragraphs 19.15A to 19.15C" [emphasis added]. [FRS 102.19.14].

This approach is consistent with the requirements of the CA 2006, whereby goodwill must be recognised as the difference between the fair values at the acquisition date of the identifiable assets and liabilities of the undertaking acquired and the acquisition cost of the interest in the shares of the undertaking. [6 Sch 9].

It is important to note that where the equity method of accounting has been discontinued, as it would be where a business combination is achieved in stages, any amounts recognised in other comprehensive income relating to the associate would not be reclassified to profit or loss in accounting for the business combination. [FRS 102.14.8(i)].

The following Illustration shows the application of these principles.

Illustration 3-22: Business combination achieved in stages (step acquisition) (1)

Company A acquires a 10% ownership interest in Company B on 1 January 20X6 for £5 million cash. Company A acquired a further 20% ownership interest in Company B for £10 million cash on 1 January 20X8 and obtained significant influence. At 1 January 20X9, Company A's equity-accounted interest in Company B was £18 million. Company A acquired a further 30% of Company B for £30 million cash on 1 January 20X9 and obtained control. The fair value of Company B's identifiable net assets at 1 January 20X9 was £60 million. In accordance with paragraph 19.11A of FRS 102, the cost of the business combination is £45 million, being the aggregate of the cash paid at each stage in exchange for control. Company A's share of the identifiable net assets of Company B is £36 million (being 60% of £60 million), resulting in goodwill of £9 million. Company A will record the following entries in its consolidated financial statements at the date of the business combination:

	<i>Dr</i>	<i>Cr</i>
	£m	£m
Identifiable net assets of Company B	60	
Goodwill (£45m - (60% of £60m))	9	
Non-controlling interest (40% of £60m)		24
Cash		30
Equity investment in Company B		18
Other comprehensive income ¹	3	

¹ This 'dangling entry' represents the difference between previous cash paid (£15m) and the share of the net assets at the date control is obtained (£18m). As this is not a profit or loss it must be taken to other comprehensive income.

FRS 102's approach to step acquisitions is a practical means of applying the purchase method because it does not require retrospective assessments of the fair value of the identifiable assets and liabilities of the subsidiary. However, the FRC notes that in certain circumstances not using the fair values at the dates of earlier purchases may result in accounting that is inconsistent with the way the investment has been treated previously and, for that reason, may fail to give a true and fair view. [FRS 102.A3.19].

For example, when an associate becomes a subsidiary, using the method required by the Regulations and paragraph 9.19B of FRS 102 to calculate goodwill has the effect that the group's share of profits or losses and reserve movements of its associate becomes reclassified as goodwill (usually negative goodwill). [FRS 102.A3.20].

A similar problem may arise where an entity has substantially restated its investment in an undertaking that subsequently becomes its subsidiary. For example, where such an investment has been impaired, the application of the purchase method as set out in the Regulations would increase reserves and create an asset (goodwill). [FRS 102.A3.20].

Consequently, the FRC acknowledges that, in the rare cases where the method for calculating goodwill set out in company law and paragraph 9.19B (as discussed above) would be misleading, the goodwill must be calculated as the sum of the goodwill arising from each purchase of an interest in the relevant undertaking, adjusted as necessary for any subsequent impairment. In such circumstances, goodwill arising on each purchase is calculated as the difference between the cost of that purchase and the fair values at the date of that purchase of the identifiable assets and liabilities attributable to the interest purchased. The difference between the goodwill calculated using this method and that calculated using the method provided by company law and FRS 102 is shown in reserves. Where the statutory requirement is not applied, section 404(5) of the CA 2006 requires disclosure of the particulars of the departure, the reasons for it and its effect. Paragraph 3 of section 5 of the standard sets out the disclosures when an entity departs from a requirement of FRS 102 or from a requirement of applicable legislation (see Chapter 6 at 8.2.2).

[FRS 102.A3.21]. This is shown in Illustration 3-23 below.

Illustration 3-23: Business combination achieved in stages (step acquisition) (2)

Company A acquires a 100% holding in Company B as a result of two separate transactions, several years apart, as set out in the table below.

<i>Transaction number</i>	<i>Holding acquired</i>	<i>Fair value of net assets</i>	<i>Total value of investee</i>	<i>Price paid</i>	<i>Cumulative price paid</i>
1	49%	£8m	£10m	£4.9m	£4.9m
2	51%	£30m	£40m	£20.4m	£25.3m

At the time of the first investment, Company A determined that it had significant influence of Company B and that it was neither a subsidiary nor an interest in a jointly controlled entity. In its consolidated financial statements, Company A accordingly accounted for its investment in Company B using the equity method, in accordance with Section 14 *Investments in Associates*, with the investment initially recognised at £4.9 million. Company A subsequently obtained control of Company B through a transaction with Company B's other shareholder, paying £20.4 million in return for acquiring its 51% interest in Company B. At that date, the carrying value of Company A's 49% investment in Company B, accounted for under the equity method, was £10.8 million, having reflected £5.9 million for its share of profits of £12 million.

Applying the purchase method as stipulated by FRS 102 would result in Company A determining the cost of the business combination at £25.3 million and recognising identifiable net assets of Company B at the acquisition date of £30 million - resulting in the recognition of negative goodwill of £4.7 million. This is despite the fact that Company A had paid more than its proportionate share of the fair value of the net assets at each transaction. There would also be a debit of £5.9 million taken to other comprehensive income, being the difference between the original price paid (£4.9 million) and the investment under the equity method (£10.8 million). This is effectively the reversal of the previously recognised equity-accounted share of profits. As discussed at 3.9.3 above, Company A would recognise this negative goodwill in profit or loss in the periods in which the non-monetary assets are recovered.

However, assuming that this accounting for goodwill is considered misleading, goodwill would be calculated as £6.1 million, being £1.0 million for the first transaction (£4.9 million - £3.9 million (49% × £8.0 million)) and £5.1 million for the second transaction (£20.4 million - £15.3 million (51% × £30.0 million)). The difference between this goodwill of £6.1 million and the negative goodwill of £4.7 million (calculated using the method provided by company law and FRS 102), i.e., £10.8 million, is to be taken to reserves (presumably through other comprehensive income). This difference of £10.8 million, together with the previously calculated debit to other comprehensive income of £5.9 million, means that a credit of £4.9 million is taken to other comprehensive income. This effectively represents 49% of the increase of £10 million in the fair value of the assets of Company B at the date of the business combination (i.e., £30 million - £20 million, being £8 million plus £12 million (Company B profits recognised between transaction 1 and 2)).

4 Disclosures relating to business combinations and goodwill

The disclosure requirements of FRS 102 in relation to business combinations and goodwill are discussed at 4.1 to 4.2 below. The CA 2006 contains a number of detailed disclosure requirements. Some of these duplicate those contained in FRS 102 but there are a few additional matters in the legislation, and these are considered at 4.3.3 below.

4.1 Business combinations during the reporting period

For each business combination, excluding any group reconstruction (see 5.6 below for disclosure requirements in respect of group reconstructions), that was effected during the period, the acquirer must disclose the following: [FRS 102.19.25, FRS 102.19.26B]

- (a) The names and descriptions of the combining entities or businesses
- (b) The primary reasons for the business combination and a description of how the acquirer obtained control of the acquiree
- (c) The acquisition date
- (d) The percentage of voting equity instruments acquired
- (e) The amount of any non-controlling interest in the acquiree recognised at the acquisition date
- (f) The cost of the combination and a description of the components of that cost (such as cash, equity instruments and debt instruments)
- (g) For contingent consideration arrangements:
 - (i) The amount recognised as of the acquisition date
 - (ii) A description of the arrangement and the basis for determining the amount of the payment
 - And
 - (iii) An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why a range cannot be estimated. If the maximum amount of the payment is unlimited, the acquirer must disclose that fact
- (h) The amounts recognised at the acquisition date for each class of the acquiree's assets, liabilities and contingent liabilities, including goodwill
- (i) A qualitative description of the nature of intangible assets included in goodwill (see 3.7.3.A above)
- (j) The useful life of goodwill, and if this cannot be reliably estimated, supporting reasons for the period chosen (see 3.9.2 above). (Paragraph 19.26B of FRS 102 makes it clear that it is only in exceptional cases that an entity is unable to make a reliable estimate of the useful life of goodwill)
- (k) The periods in which any negative goodwill (see 3.9.3 above) will be recognised in profit or loss
- And
- (l) For each contingent liability that is not recognised in accordance with paragraph 19.15F of FRS 102 because its fair value cannot be measured reliably, for each class of contingent liability at the reporting date:
 - (i) A brief description of the nature of the contingent liability
 - (ii) An estimate of its financial effect, measured in accordance with paragraphs 21.7 to 21.11.
 - (iii) An indication of the uncertainties relating to the amount or timing of any outflow
 - And
 - (iv) The possibility of any reimbursement

The disclosures in (ii), (iii) and (iv) are required to be given, where practicable. If it is impracticable to make one or more of these disclosures, that fact must be stated [FRS 102.21.15]

Disclosure is required of the amounts of revenue and profit or loss of the acquiree since the acquisition date included in the consolidated statement of comprehensive income. Such disclosure must be provided separately for each material business combination or in aggregate for business combinations that are not individually material. [FRS 102.19.25A].

As discussed at 3.7.5 above, the accounting for a business combination might be based on provisional amounts which are later retrospectively adjusted to reflect their finalisation within twelve months after the acquisition date. [FRS 102.19.19]. In this circumstance, disclosure is required of that fact and the line items for which provisional amounts have been recognised. [FRS 102.19.25B]. FRS 102 is silent as to whether any disclosures are required on the subsequent finalisation of provisional amounts. As any subsequent adjustments will be accounted for retrospectively by restating comparatives, we would expect disclosure that such adjustments have been made, and the reasons. [1 Sch 7, 6 Sch 1].

4.2 Goodwill reconciliations

In addition to disclosures for business combinations effected during the period, an acquirer must disclose a reconciliation of the carrying amount of goodwill at the beginning and end of the reporting period, showing separately: *[FRS 102.19.26]*

- Additional goodwill recognised during the reporting period arising from new business combinations
 - Amortisation
 - Impairment losses recognised during the reporting period in accordance with Section 27
 - Goodwill derecognised during the reporting period in relation to previously acquired businesses.
- And
- Other changes

A similar reconciliation is also required in respect of any negative goodwill - albeit with no impairment, and with 'amortisation' replaced by 'amounts recognised in profit or loss in accordance with paragraph 19.24(c) of FRS 102'. *[FRS 102.19.26A]*.

The above reconciliations need not be presented for prior periods. *[FRS 102.19.26. FRS 102.19.26A]*.

Section 27 requires further disclosures be made in respect of the amount of the impairment losses and reversals on goodwill (including the line items in which included), together with a description of the events and circumstances leading to the recognition or reversal of the impairment loss (see Chapter 29 at 9).

[FRS 102.27.32, FRS 102.27.33(a), FRS 102.27.33A].

4.3 Other disclosures

4.3.1 Step acquisitions

As discussed at 3.11 above, in rare cases where the method for calculating goodwill set out in company law and paragraph 9.19B would be misleading, the goodwill must be calculated as the sum of goodwill arising from each purchase of an interest in the relevant undertaking adjusted as necessary for any subsequent impairment. Where the FRS 102 or statutory requirement is not applied, paragraph 3.5 and section 404(5) of the CA 2006 sets out the necessary disclosures when applying a 'true and fair override' (see Chapter 6 at 8.2.2). *[FRS 102.3.5, s404(5)]*.

4.3.2 Reverse acquisitions

As discussed at 3.10 above, to adopt reverse acquisition accounting represents a departure from company law which does not envisage such occurrence. Such departure is required where it is necessary to give a true and fair view. In such circumstances, there must be disclosure of a true and fair view override departure from the CA 2006, and disclosure of the particulars, reasons and effect. *[FRS 102.3.5, s404(5)]*.

4.3.3 Company law disclosures

The CA 2006 contains a number of detailed disclosure requirements that are relevant for business combinations to be shown in the notes to the financial statements. *[6 Sch 13]*. Some of these duplicate those contained in FRS 102 but there are a few additional matters in the legislation that need to be considered.

The CA 2006 requires disclosure of the names of subsidiaries acquired, (or where a group was acquired, the name of the parent undertaking of that group) and whether they have been accounted for by the acquisition or the merger method of accounting, even if they do not significantly affect the figures shown in the consolidated financial statements. *[6 Sch 13(2)]*.

In relation to an acquisition which significantly affects the figures shown in the consolidated financial statements, the CA 2006 requires disclosures of: *[6 Sch 13(3), 6 Sch 13(4)]*

- (a) The composition and the fair value of the consideration for the acquisition given by the parent company and its subsidiary undertakings
- And
- (b) Where the acquisition method of accounting has been adopted:
 - (i) The book values immediately prior to the acquisition of each class of assets and liabilities of the undertaking or group acquired (to be stated in tabular form)
 - (ii) The fair values at the date of acquisition, of each class of assets and liabilities of the undertaking or group acquired (to be stated in tabular form)

- (iii) A statement of the amount of any goodwill or negative consolidation difference arising on the acquisition

And

- (iv) An explanation of any significant adjustments made

There must also be stated the cumulative amount of goodwill resulting from acquisitions in that and earlier years which has been written off otherwise than in the consolidated profit and loss account. That figure must be shown net of any goodwill attributable to subsidiary undertakings or businesses disposed of prior to the balance sheet date. [6 Sch 14]. This disclosure requirement would apply in limited circumstances only, for example when the entity has legacy amounts of goodwill written off directly to reserves, which was a policy permitted under previous UK GAAP prior to the introduction of FRS 10 *Goodwill and intangible assets*. Under FRS 102, such amounts are never reclassified to profit or loss.

UK company law provides an exemption from disclosing the above information in certain circumstances. It need not be disclosed with respect to an undertaking which:

- Is established under the law of a country outside the United Kingdom.

Or

- Carries on business outside the United Kingdom.

if in the opinion of the directors of the parent company the disclosure would be seriously prejudicial to the business of that undertaking or to the business of the parent company or any of its subsidiary undertakings and the Secretary of State agrees that the information must not be disclosed. [6 Sch 16].

5 Group reconstructions

Section 19 requires all business combinations (apart from certain public entity combinations) to be accounted for by applying the purchase method, except for group reconstructions which may be accounted for using the merger accounting method [emphasis added]. [FRS 102.19.6].

Under FRS 102, the use of the merger accounting method for group reconstructions is optional. In most cases where the criteria to apply the merger accounting method are met, the acquirer will wish to use the merger accounting method, thereby avoiding the need to determine fair values of the identifiable assets, liabilities and contingent liabilities of the acquiree as well as the fair value of the consideration given.

Where the option of using the merger accounting method is not taken, the purchase method (acquisition accounting) needs to be used. Historically, FRS 6 *Acquisitions and Mergers* stated: "Acquisition accounting would require the restatement at fair value of the assets and liabilities of the company transferred, and the recognising of goodwill, which is likely to be inappropriate in the case of a transaction that does not alter the relative rights of the ultimate shareholders", [FRS 6.78], and this sentence in FRS 6 was used as support for the argument that application of acquisition accounting was unlikely to give a true and fair view. While FRS 102 contains no such health warning, the position is likely to remain the same that, in certain circumstances, notwithstanding that it is permitted (or required, where the strict criteria for use of the merger accounting method are not met) by company law and FRS 102, the application of the purchase method and all that it entails would not be appropriate, and that a 'true and fair override' to apply the merger accounting method may be necessary.

In addition, as discussed at 3.4 above, when applying the purchase method, it is necessary to identify the accounting acquirer in the business combination. In certain group reconstructions, particularly those effected using a newly incorporated entity, the accounting acquirer is not necessarily the legal acquirer (or there might not be an accounting acquirer). Therefore, it could be that use of the merger accounting method is appropriate in these scenarios (see Illustration 5-1 below).

Illustration 5-1: Newco inserted at the top of an existing group

A Newco is incorporated and inserted at the top of an existing group, which is a business as defined in Section 19. Newco issues shares to the existing shareholders of Entity A in exchange for the shares already held in that entity. There are no changes to the shareholder group. The group structure before and after this transaction is as follows:

Before

After

How would this reorganisation be accounted for in Newco's consolidated financial statements?

How we see it

The transaction in this specific fact pattern is a group reconstruction because it is the addition of a new parent entity to the group. In our view, Newco cannot elect to apply the purchase method. Rather, its consolidated financial statements are a continuation of the existing group.

Neither Newco nor Entity A is identified as the acquirer. Newco is not identified as the acquirer as it issues shares to effect the combination. [FRS 102.19A.5]. FRS 102 notes that the result of nearly all business combinations is that one entity, the acquirer, obtains control of one or more other businesses. Since Newco is not a business, Entity A is also not identified as the acquirer. [FRS 102.19.3]. Accordingly, it is appropriate to use merger accounting rather than the purchase method (which requires identification of an acquirer). As explained at 5.2.1.A below, this accounting might sometimes require use of a 'true and fair override', with its related disclosures.

Furthermore, the transaction does not result in any change of economic substance (e.g., in terms of any real alteration to the composition or ownership of the group). Accordingly, Newco's consolidated financial statements reflect that the arrangement is in substance a continuation of Entity A's group (combined with a capital reorganisation to reflect Newco's capital structure) and will reflect pre-combination carrying amounts for Entity A's group under merger accounting.

The determination of whether a group applies the purchase method or the merger accounting method is further discussed at 5.4.1.A below.

5.1 Scope and applicability to various structures

Extract from FRS 102

Appendix I

Glossary

group reconstruction

Any one of the following arrangements:

- (a) the transfer of an equity holding in a subsidiary from one group entity to another;
- (b) the addition of a new parent entity to a group;
- (c) the transfer of equity holdings in one or more subsidiaries of a group to a new entity that is not a group entity but whose equity holders are the same as those of the group's parent;
- (d) the combination into a group of two or more entities that before the combination had the same equity holders;
- (e) the transfer of the business of one group entity to another; or
- (f) the transfer of the business of one group entity to a new entity that is not a group entity but those equity holders are the same as those of the group's parent.

FRS 102 identifies that while its explanation of the merger accounting method (see 5.3 below) is drafted in terms of an acquirer or issuing entity issuing shares as consideration for the transfer to it of shares in the other parties to the combination, the provisions also apply to other arrangements that achieve similar results. [FRS 102.19.28].

5.2 Qualifying conditions

Extract from FRS 102

Group reconstructions

19.27 Group reconstructions may be accounted for by using the merger accounting method provided:

- (a) the use of the merger accounting method is not prohibited by company law or other relevant legislation;
- (b) the ultimate equity holders remain the same, and the rights of each equity holder, relative to the others, are unchanged; and
- (c) no non-controlling interest in the net assets of the group is altered by the transfer.

The first condition is discussed further in 5.2.1 below.

The following Illustration shows one issue that could arise when analysing the second condition.

Illustration 5-2: Application of the true and fair override to apply merger accounting where the rights of each equity holder relative to the others before and after the transaction are changed

Company A owns 100% of each of Companies B and C. Company A is owned by two individuals, X owns 85% and is the controlling party, while Y owns 15%.

Y wishes to exit the business. To facilitate this, Newco is incorporated to become the new parent company of the group. Newco issues shares to X in exchange for all X's shares in Company A. Y sells their shares to Newco in return for loan notes of £2m. These are settled immediately following the transaction by Company A declaring and paying a dividend of £2m to Newco, and Newco using the resulting cash to settle the liability.

In the consolidated financial statements of Newco, can it apply the merger accounting method?

The definition of a group reconstruction in FRS 102 includes the addition of a new parent entity to a group (see 5.1 above). However, viewed as a whole, the transaction results in X and Y having different ownership interests in the group after the transaction, since Y exits. This contravenes the requirements in paragraph 19.27 of FRS 102 that the relative rights of the equity holders remain unchanged (see 5.2 above).

How we see it

In our view, the substance of the transaction has two separate elements: the insertion of Newco (a group reconstruction) and the exit of Y. Therefore, in our view, merger accounting may be applied in Newco's consolidated financial statements, and a true and fair override is required in respect of the requirements in paragraph 19.27 of FRS 102 that the relative rights of the equity holders remain unchanged.

The third condition must be considered, for example, when the group reconstruction involves transfers in or out of a sub-group with a non-controlling interest. In such a case, the non-controlling interest is likely to be affected by the transfer and the transaction might not qualify for merger accounting as a result.

5.2.1 UK company law and GAAP considerations

UK company law sets out requirements that must be met in consolidated financial statements before merger accounting can be applied. The conditions laid down in the Regulations for accounting for an acquisition of a subsidiary undertaking as a merger are that: [6 Sch 10]

- (a) The undertaking whose shares are acquired is ultimately controlled by the same party both before and after the acquisition (see 5.2.1.A).
 - (b) The control referred to in (a) above is not intended to be transitory (see 5.2.1.B).
- And
- (c) The adoption of the merger method of accounting accords with generally accepted accounting principles or practice (see 5.2.1.C).

The conditions set out in the Regulations apply only to consolidated financial statements and where an undertaking becomes a subsidiary undertaking of the parent company. [6 Sch 7(1)]. They do not apply to group reconstructions involving a business which is not a subsidiary undertaking.

For LLPs, only criteria (c) above needs to be met. [3 Sch 10 (LLP)]. Again, the conditions set out in the LLP Regulations apply only to consolidated financial statements and where an undertaking becomes a subsidiary undertaking of the parent LLP. [3 Sch 7(1) (LLP)]. They do not apply to group reconstructions involving a business which is not a subsidiary undertaking.

5.2.1.A The same controlling party before and after the acquisition

The undertaking must be controlled by the same party both before and after the transaction. Accordingly, for example, the transfer of a 75% subsidiary from one group entity to another would qualify for the merger accounting method (assuming the other conditions under the Regulations and FRS 102 are met).

A transaction in which a new parent is inserted above an existing group might not meet the requirements for use of the merger accounting method. While the undertaking whose shares are acquired (e.g., the previous ultimate parent of a group) would have the same ultimate equity holders as before, it could be that there is no single controlling party either before or after the transaction. The Basis of Conclusions to FRS 102 observes that paragraph 10 of Schedule 6 to the Regulations is generally consistent with paragraph 19.27 of FRS 102 (see the extract at 5.2 above). However, if an entity considers that, for the overriding purpose of giving a true and fair view, merger accounting needs to be applied in circumstances other than those set out in paragraph 10 of Schedule 6 to the Regulations, it may do so providing the relevant disclosures are made in the notes to the financial statements. [FRS 102.BC.A3.30]. See Chapter 6 at 8.2.2 for a discussion of the true and fair override and the disclosures required.

Other arrangements meeting the definition of a group reconstruction under FRS 102 involving equity holders that are the same, but with no single controlling party, may also need to invoke 'a true and fair override' in order to apply the merger method of accounting.

In some cases, a newly incorporated company (Newco) might be involved in a transaction and in certain circumstances it might be identified as an acquirer, meaning that the purchase method is appropriate (see Illustration 3-6 at 3.4.2 above). There is further discussion of whether Newcos can be an acquirer in 3.4.2 above and 5.2.1.B below.

5.2.1.B Control is not intended to be transitory

The note on legal requirements in Appendix III to FRS 102 provides no additional guidance on this criterion. IFRS 3 contains a similar requirement within its scope exemption for business combinations under common control. [IFRS 3.B1]. This criterion addresses concerns that business combinations between parties acting at arm's length - that would otherwise be accounted using the purchase method - could be structured through the use of 'grooming' transactions so that, for a brief period immediately before and after the combination, the combining entities or businesses are under common control.

Judgement will be required when assessing whether control is transitory in certain scenarios; for example, when a transaction that qualifies as a group reconstruction under FRS 102 is completed at the same time as other transactions that result in a change of control.

Often a reorganisation involves the formation of a new entity (Newco) to facilitate the sale of part of an organisation.

How we see it

In our view, common control is not considered to be 'transitory' just because a reorganisation is undertaken to facilitate the disposal of businesses (e.g., by sale or IPO). Whether common control is transitory or not is assessed by looking at the duration of control over each of the combining businesses in the period before and after the reorganisation. It is not limited to an assessment of the duration of control only after the reorganisation.

Illustration 5-3: Transitory control

Entity A currently has two businesses operated through Entity X and Entity Y. The group structure (ignoring other entities within the group) is as follows:

Entity A proposes to combine the two businesses (currently housed in two separate entities, Entity X and Entity Y) into the one entity and then spin-off the combined entity as part of an IPO. Both of the businesses have been owned by Entity A for several years. The internal reconstruction will be structured such that Entity A will establish a new entity (Newco) and transfer its interests in Entity X and Entity Y to Newco, resulting in the following group structure:

After the IPO, Newco will no longer be under the control of Entity A.

In the consolidated financial statements of Newco, is it entitled to use the merger accounting method?

The question of whether the entities or businesses are under common control applies to the combining entities that existed before the combination, excluding Newco, i.e., Entity X and Entity Y. These entities have clearly been under the common control of Entity A and remain so after the transfer.

If Newco were preparing consolidated financial statements without there being an intended IPO, it would be entitled to use the merger accounting method (assuming that all other conditions for merger accounting in the CA 2006 and paragraph 19.27 of FRS 102 are met). However, as the purpose of the transaction was to facilitate the disposal of the businesses by way of the IPO, such that Entity A no longer has control over Entity X and Entity Y, does this mean that common control is 'transitory' and the merger accounting method cannot be applied?

In our view, the answer is 'no'. Common control is not considered to be transitory and therefore the reorganisation does not breach the transitory control condition for use of merger accounting in the CA 2006. This is consistent with the ordinary meaning of 'transitory', something which is fleeting, brief or temporary. The common control of Entity X and Entity Y was not fleeting in the fact pattern as both entities had been controlled by Entity A for several years. Assuming all other legal conditions and those in paragraph 19.27 of FRS 102 are met, Newco may apply the merger accounting method in its consolidated financial statements.

Although this Illustration involves a new entity, the same considerations apply regardless of the manner in which the internal reconstruction has been structured. For example, Entity X might have acquired Entity Y, with Entity X then being the subject of an IPO. In such a situation, Entity X would be entitled to use the merger accounting method with respect to the group reconstruction (assuming all other legal conditions and those in paragraph 19.27 of FRS 102 had been met). By contrast, if Entity Y had only recently come into the group, this could indicate that control is transitory.

However, if such a restructuring was an integral part of another transaction such as a sale or disposal via an IPO, the circumstances might be such that Newco could be regarded as the acquirer if it is considered to effectively be an extension of the new owners, and therefore use of the purchase method might be appropriate. An example is in Illustration 3-6 at 3.4.2 above. A Newco incorporated by the existing parent of the subsidiaries concerned would not generally be identified as the acquirer, but in this particular situation the critical distinguishing factor is that the acquisition of the subsidiaries is conditional on an IPO of Newco. This means that there has been a substantial change in ownership of the subsidiaries by virtue of the IPO. Whether a Newco formed to facilitate an IPO is capable of being identified as an acquirer depends on the facts and circumstances and ultimately requires judgement.

5.2.1.C Adoption of the merger accounting method accords with GAAP

This criterion is met for group reconstructions meeting the qualifying conditions set out in Section 19 for use of the merger accounting method under FRS 102 (see 5.2 above). [FRS 102.19.27].

5.3 Merger accounting method

FRS 102 explains that where the merger accounting method is applied:

- The carrying values of the assets and liabilities of the parties to the combination are not required to be adjusted to fair value, although appropriate adjustments must be made to achieve uniformity of accounting policies in the combining entities. [FRS 102.19.29].
- The results and cash flows of all the combining entities must be brought into the financial statements of the combined entity from the beginning of the financial year in which the combination occurred, adjusted so as to achieve uniformity of accounting policies.

- (c) The comparative information must be restated by including, for all the combining entities, the total comprehensive income for the previous reporting period and their statement of financial position for the previous reporting date, adjusted as necessary to achieve uniformity of accounting policies. [FRS 102.19.30].
- (d) The difference, if any, between the nominal value of the shares issued plus the fair value of any other consideration given, and the nominal value of the shares received in exchange must be shown as a movement on other reserves in the consolidated financial statements. Any existing balances on the share premium account or capital redemption reserve of the new subsidiary must be brought in by being shown as a movement on other reserves. These movements must be shown in the statement of changes in equity. [FRS 102.19.31].

And

- (e) Merger expenses are not to be included as part of this adjustment, but must be charged to the statement of comprehensive income as part of profit or loss of the combined entity at the effective date of the group reconstruction. [FRS 102.19.32].

These requirements in FRS 102 are similar to those contained in the Regulations when accounting for the acquisition of a subsidiary under the merger method of accounting in Companies Act group accounts.

[6 Sch 11].

FRS 102 requires a subsidiary to be excluded from consolidation where (1) the exercise of the rights of the parent over the assets or management of the subsidiary are substantially hindered by severe long-term restrictions or (2) the interest on the subsidiary is held exclusively with a view to subsequent resale and the subsidiary has not previously been consolidated. [FRS 102.9.9]. The standard also permits a subsidiary to be excluded from consolidation when its inclusion is not material (in aggregate, if there is more than one subsidiary excluded) for the purpose of giving a true and fair view. [FRS 102.9.9A]. If a subsidiary is excluded from consolidation for the aforementioned reasons, then the excluded subsidiary would not be one of the combining entities referred to in point (b) and point (c) above.

The above wording explaining the merger accounting method is drafted in terms of an acquirer or issuing entity issuing shares as consideration for the transfer of shares in the other parties to the combination, [FRS 102.19.28], and refers to consolidated financial statements. The application of the above requirements in the context of consolidated financial statements are discussed further at 5.3.1 to 5.3.5 below.

However, FRS 102 indicates that the provisions also apply to other arrangements that achieve similar results. [FRS 102.19.28]. In particular, the definition of a group reconstruction also includes arrangements such as the acquisition by an individual entity of the trade and net assets of another entity within the same group. Particular issues relating to the application of the above requirements in the context of individual financial statements are discussed at 5.4 below and Illustrations 5-10 to 5-16 demonstrate the application of the merger accounting method in the individual financial statements.

5.3.1 Carrying values of assets and liabilities

For group reconstructions involving the transfer of an equity holding in a subsidiary from one group entity to another, no adjustments would be expected to be required to conform accounting policies. This is because in the preparation of the consolidated financial statements of the ultimate parent entity, uniform accounting policies would have been expected to be adopted by all members of the group. [FRS 102.9.17]. However, it would be necessary to make adjustments where the combining entities have used different accounting policies when preparing their own financial statements, and the carrying values of the assets and liabilities being used are based on the financial statements of the transferred entity. This is more likely to be the case for a group reconstruction involving the combination into a group of two or more entities that before the combination had the same equity holders.

The main issue relating to the use of carrying values is whether the amounts for the transferred entity (or entities) are based on the carrying values reported at the level of:

- (a) The financial statements of the transferred entity
- Or
- (b) The consolidated financial statements of the parent

The carrying values with respect to the reporting entity are the same as those in its existing financial statements prior to the transfer of the other entity.

How we see it

In our view, either basis (a) or (b) above for determining the carrying values of the transferred business could be acceptable provided that the resulting information is relevant and reliable in the particular circumstances. This may require an entity to exercise judgement.

Where the transferred entity had been previously acquired by the parent, using the carrying values (including any fair value adjustments and goodwill arising on that acquisition) reported in the consolidated financial statements of the parent might be more appropriate as those carrying amounts might be more recent (and therefore relevant) and reflect the perspective of the party that effectively directs the transaction. This results in the assets and liabilities being reported on the same basis as if the transferred entity had been acquired by the reporting entity at the time the transferred entity was acquired by the parent.

Using the carrying values reported in the financial statements of the transferred entity is more straightforward. Rather than the assets and liabilities being reported in two previous sets of financial statements, they are now reported in a single set of financial statements. Indeed, the Regulations state that “the assets and liabilities of the undertaking acquired must be brought into the group accounts at the figures at which they stand in the undertaking’s accounts, subject to any adjustment authorised or required by this Schedule”. [6 Sch 11(2)].

When evaluating which basis to use, the following factors can be helpful:

- The timing of the group reconstruction in comparison to when the transferred business was previously acquired by the controlling party, if applicable. Generally, the carrying amounts in the consolidated financial statements might be more relevant as they were reassessed more recently. However, the longer the period since the previous acquisition by the controlling party, the less relevant this factor might be.
- Whether the transaction is a ‘grooming’ transaction in preparation for a spin-off, sale or similar external transaction. Generally, the carrying amounts in the consolidated financial statements might be more relevant in such a situation (for the reasons explained above).
- The identity and nature of the users of the financial statements. If a broad group of users of the financial statements of the receiving entity after the transaction are parties that previously relied upon the financial statements of, or including, the transferred business before the transaction (e.g., if there are significant non-controlling interests and/or creditors), using the amounts in the financial statements of the transferred entity might provide more relevant information.
- Whether consistent accounting policies are used within the group for similar and related common control transactions.
- Difficulties in identifying reliable book values under UK GAAP for the transferred business. It will be more difficult and costly to use the carrying amounts in the consolidated financial statements if the controlling party has not previously prepared UK GAAP consolidated financial statements. In addition, it might be that allocations of goodwill and intangible assets which are reported in the UK GAAP consolidated financial statements need to be made when determining the consolidated book values relating to the transferred business. In such circumstances, it might be more straightforward to determine the carrying amounts in accordance with UK GAAP for the transferred business particularly if these already exist.

The considerations on use of different bases for the carrying values of the transferred business are further discussed at Illustration 5-4 below, and in relation to different hive transactions at Illustration 5-10 at 5.4.2.A below, Illustration 5-11 at 5.4.2.C below, Illustration 5-13 at 5.4.2.E below and Illustration 5-14 at 5.4.3.A below.

Illustration 5-4: Merger accounting method - carrying amounts of assets acquired and liabilities assumed

Entity A currently has two businesses operated through wholly owned subsidiaries Entity B and Entity C. The group structure (ignoring other entities within the group) is as follows:

Both entities have been owned by Entity A for several years.

On 1 October 20X6, Entity A restructures the group by transferring its investment in Entity C to Entity B, such that Entity C becomes a subsidiary of Entity B.

In Entity B's consolidated financial statements for the year ending 31 December 20X6, which carrying amounts would be reflected in respect of the assets and liabilities of Entity C?

How we see it

The rationale for using the carrying amounts reported in Entity A's consolidated financial statements in the consolidated financial statements of Entity B is that from a group perspective of Entity B's shareholder, Entity A, nothing has changed except the location of those assets and liabilities. Entity B has effectively taken on the group's ownership. Therefore, the carrying amounts used in the consolidated financial statements of Entity A are appropriate and relevant values to apply to the assets and liabilities of Entity C consolidated by Entity B, as they represent the carrying amounts to the Entity A group.

The carrying amounts of Entity C on this basis will be based on their fair values as at the date Entity C became part of the Entity A group and adjusted for subsequently in accordance with FRS 102. Any goodwill relating to Entity C that was recognised in Entity A's consolidated financial statements, will also be recognised in Entity B's consolidated financial statements. The carrying amounts of the net assets of Entity B will remain as before.

5.3.2 Restatement of financial information prior to the date of the combination

The description of the merger accounting method explicitly requires the results (and cash flows) of all combining entities to be included from the beginning of the financial year and for comparatives to be restated, subject to the exclusion from consolidation of certain subsidiaries dealt with in paragraphs 9.9 and 9.9A of FRS 102 (see 5.3 above). [FRS 102.19.30].

This will be appropriate where the entity applying the merger accounting method in its consolidated financial statements and the entity (or entities) transferred to it under the group reconstruction have been under the control of the ultimate parent or common controlling party for at least that period of time. Indeed, this is consistent with the equivalent requirements in the Regulations which are as follows:

[6 Sch 11(3), 6 Sch (4)]

- The income and expenditure of the undertaking acquired must be included in the group accounts for the entire financial year, including the period before the acquisition.

And

- The group accounts must show corresponding amounts relating to the financial year as if the undertaking acquired had been included in the consolidation throughout that year.

Effectively, the use of the merger accounting method results in the consolidated financial statements reflecting information as if the new sub-group had existed for the entire duration of the period covered by the financial statements. However, where the entities have come under the common control of the ultimate parent or common controlling party at a date after the beginning of the comparative period, this will not have been the case.

How we see it

In our view, in this situation, the results (and cash flows) of the transferred entity (or entities) must be included only from the date that it, and the entity applying the merger method of accounting, came under the control of the parent or the controlling party. This is the earliest date that the sub-group could have been created, and the results (and cash flows) must reflect that position.

5.3.3 Equity eliminations

As well as combining the assets and liabilities of the companies concerned, it will be necessary to eliminate the share capital of the new subsidiary against the cost of the investment as stated in the balance sheet of the new holding company. This is in principle a straightforward exercise, but when the two amounts do not equate to each other, the question arises of what to do with the difference, positive or negative.

The description of the merger accounting method at 5.3 above appears to presume that the cost of the investment will normally be carried at the nominal value of the shares of the new holding company which have been issued to effect the combination, together with the fair value of any other consideration given. (The ability to record these shares at nominal rather than fair value on issue depends on qualifying for merger relief under section 612 of the CA 2006, which is discussed at 5.5.1 below.) This will not be the case in a group reconstruction falling within the scope of group reconstruction relief under section 611 of the CA 2006 where, as a result of recognising a minimum premium value in share premium, the cost of investment reflects an amount in excess of the nominal value of the shares issued (see 5.5.2 below).

How we see it

Where a group reconstruction falls within the remit of group reconstruction relief under section 611 of the Companies Act 2006 and the cost of investment reflects an amount in excess of the nominal value of shares issued in exchange for the investment in subsidiary, we believe that this cost must be used in determining the difference to be accounted for under FRS 102, consistent with the requirements of the CA 2006.

FRS 102 requires the difference to be shown as a movement on other reserves in the consolidated financial statements and also to be shown in the statement of changes in equity. [FRS 102.19.31]. The CA 2006 also requires such difference to be shown as a movement in consolidated reserves. [6 Sch 11(6)]. However, neither FRS 102 nor the legislation specifies any particular reserve.

Where the cost of the investment is less than the nominal value of the share capital of the subsidiary, the elimination of these two amounts will leave a residual credit in shareholders' funds in the consolidated balance sheet; this is generally classified as some form of capital reserve (or merger reserve).

Where the reverse situation applies, the net debit has to be eliminated against consolidated reserves. There are no particular rules on the matter, but common practice is to eliminate against a merger or similar reserve, or retained earnings, although some companies create a separate debit reserve. To the extent that the subsidiary has reserves that could be reclassified to profit or loss in the future under FRS 102, e.g., a cash flow hedge reserve, a fair value available-for-sale reserve (where IAS 39 is applied) or a reserve arising from debt assets at fair value through other comprehensive income under IFRS 9, it would not be appropriate to eliminate any debit adjustment against such reserves.

Apart from the effects of dealing with any imbalance as discussed above, there is no other elimination of the reserves of the subsidiary, which are combined with those of the holding company, in contrast to the treatment under the purchase method. However, some of the subsidiary's other reserves may need to be reclassified in order to make sense in the context of the group financial statements.

FRS 102 requires that any existing balance on the share premium account or capital redemption reserve of the new subsidiary undertaking is brought in by being shown as a movement on other reserves in the statement of changes in equity. [FRS 102.19.31]. This is because these statutory reserves do not relate to the share capital of the reporting entity. Such a difference would generally be taken to the same reserve as that on the elimination of the share capital of the subsidiary, because in reality the distinction between share capital and share premium can be considered arbitrary in this context.

Although the discussion above deals with the equity eliminations required, the application of the merger method of accounting also requires comparative information in the consolidated financial statements to be restated (see 5.3.2 above). [FRS 102.19.30]. Assuming the new subsidiary is being included from the beginning of the comparative period, this will generally mean that where share capital has been issued by the reporting entity to effect the group reconstruction, in applying the merger method of accounting, it is treated as if it had been in issue at the beginning of that period. However, if the subsidiary had issued any

share capital between the beginning of the comparative period and the date of the group reconstruction, then this will need to be shown as a movement in the year and not at the beginning of the comparative period. The movement will be the equivalent amount of shares issued by the reporting entity (parent entity) to acquire those newly issued subsidiary shares. Where the reporting entity has given any other form of consideration to effect the group reconstruction, e.g., cash or incurred an intra-group financial liability, arguably this might also be accounted for as if the liability for such consideration arose at the beginning of the comparative period, but this then raises an issue as to whether the liability is discounted to its present value at that date, with any unwinding of the discount reflected in the consolidated profit or loss.

How we see it

We believe it would be acceptable to account for the liability for such consideration at the date of the reorganisation, with the corresponding debit being reflected in the consolidated statement of equity at that time.

5.3.4 Expenses of the merger

One other question which sometimes arises in this context is how to account for the expenses of the merger. FRS 102 requires that all merger expenses are charged to the statement of comprehensive income as part of profit or loss of the combined entity at the effective date of the group reconstruction.

[FRS 102.19.32].

However, some of these costs may be regarded as share issue expenses and therefore qualify to be written off against any share premium account recognised by the holding company in respect of the shares issued to effect the group reconstruction. FRS 102 does not prohibit the subsequent charging of such costs to the share premium account by means of a transfer between reserves.

Similarly, if a debt instrument such as a loan was utilised to finance the merger, some of these costs may be regarded as debt transaction costs and therefore qualify to be capitalised against the liability recognised by the holding company in respect of the debt instrument issued to effect the group reconstruction.

[FRS 102.11.13]

5.3.5 Non-coterminous accounting periods

Particular practical problems in applying the merger method of accounting can arise when the accounting periods of the combining companies do not match each other. For many group reconstructions involving existing companies within a group, this might not be an issue as the ultimate controlling parent is likely to have taken steps to ensure that its subsidiaries had coterminous accounting periods (or prepared interim financial statements as at the ultimate controlling parent's reporting date). However, for some forms of group reconstructions that might not be the case and the requirement (in applying merger accounting) to restate the consolidated financial statements retrospectively can cause difficulties.

The CA 2006 requires that directors of a company, as well as preparing individual accounts for a company's financial year (based on its accounting reference period), also prepare group accounts for the same year. [s399(2)]. The Companies Act group accounts so prepared must give a true and fair view in respect of the accounting period of the parent company, [s404(2)], so this will require the period used by the subsidiary to be made to conform to that of its parent rather than the other way round. Naturally, the parent could change its own accounting reference date, but this can be amended only for the future, not retrospectively. It will therefore be necessary to try to draw up financial statements for the subsidiary at each of the relevant balance sheet dates of its new parent company.

Another treatment which might be appropriate is to use non-coterminous years for the comparative figures, with the result that there will be the need to deal with the effects of either a 'gap' or an overlapping period as an adjustment to reserves. However, the use of such non-coterminous financial statements would be appropriate only if the consolidated financial statements present materially the same picture as if coterminous years had been used. As indicated in Chapter 8 at 3.5.2, the Regulations and Section 9 require that, in preparing consolidated financial statements, a subsidiary's reporting date can be used only if it is no more than three months before that of the parent, and that adjustments are made for the effects of significant transactions or events that occur between the subsidiary's reporting date and those of the consolidated financial statements.

Another instance where problems can arise is when a company is incorporated for the purpose of acting as the new parent company in a group reconstruction. The accounting reference period of the group must by law be that of the parent company, so this may result in the inadvertent creation of an accounting period which is not the one the group would have preferred. Moreover, unless the company has been in existence for two years, arguably its statutory accounts are not able to deal with the results of the group for the current and comparative periods, because strictly they will go back only as far as the date of incorporation of the parent company.

However, in practice, particularly in situations where a new top holding company is set up as part of a group reconstruction, many companies simply produce consolidated financial statements for the more relevant period(s), as if the company had always been in existence. Only the individual financial statements of the new top holding company are prepared for the period from the date of incorporation. The justification for this approach is based on the more specific provisions of the Regulations relating to group accounts:

- The consolidated balance sheet and profit and loss account must incorporate in full the information contained in the individual accounts of the undertakings included in the consolidation. [6 Sch 2(1)].
And
- The principles of the merger accounting method require information for the undertaking acquired to be included for the entire financial year, with comparatives for the previous financial year. [6 Sch 11(3), 6 Sch 11(4)].

Consider the following Illustration:

Illustration 5-5 Merger accounting by a newly incorporated parent company

Company A is incorporated on 1 April 20X6 to effect a group reorganisation on 1 July 20X6 whereby it will become the new parent entity of an existing group, headed by Company B. Company B has a financial year ending on 31 December and has prepared consolidated financial statements for the year ended 31 December 20X5. Company A gives notice to have an accounting reference date of 31 December and will prepare consolidated financial statements made up to 31 December 20X6. In doing so, Company A has determined that it is appropriate to account for the acquisition of the existing group under the merger method (invoking a true and fair override, if necessary - see 5.2.1.A above).

As indicated above, arguably the statutory consolidated financial statements will include the existing Company B group for only the 9-month period from the date of incorporation of Company A. However, this does not really provide relevant information to the shareholders of the group who have continued to have an interest in the Company B group. Common practice would be for Company A to present the year ended 31 December 20X6 (with comparatives for the year ended 31 December 20X5). The notes to the financial statements will need to explain the basis on which the consolidated financial statements have been drawn up.

If Company A had instead been incorporated on 1 October 20X5, a similar problem arises, but again, a pragmatic approach is to prepare accounts for the same period as described above. However, this may be appropriate only because Company A is a Newco and therefore is assumed to have no trade in the period from 1 October to 31 December 20X5.

5.4 Application of merger accounting in individual financial statements

5.4.1 Hive transactions

A common transaction in the individual financial statements of entities within a group is the transfer of trade and assets from one entity to another. These result in different accounting issues, which are discussed at 5.4.1.A to 5.4.4.B below. This guidance focuses on three variations of a transfer of trade and assets from:

- (a) A subsidiary to a parent, ('hive up')
- (b) One subsidiary to a fellow subsidiary, ('hive across')
- And
- (c) A parent to a subsidiary, ('hive down')

In all of the following discussions and examples in 5.4.1.A to 5.4.4.B below, it is assumed that the conditions for the use of merger accounting in FRS 102 are met (see 5.2 above), i.e.,:

- The ultimate equity holders remain the same, and the rights of each equity holder, relative to the others, are unchanged.
And
- No non-controlling interest in the net assets of the group is altered by the transfer.

Section 19 requires that the use of the merger accounting method is not prohibited by company law or other relevant legislation. [FRS 102.19.27]. All of the following examples relate to individual accounts. Therefore, the conditions for use of the merger accounting method included in the Regulations and LLP Regulations do not apply; these conditions apply only in group accounts. [6 Sch 10, 6 Sch 10 (LLP)].

In addition, it is assumed that the trade and assets transferred meet the definition of a 'business' in the Glossary to FRS 102 (see 3.2.1 above). [FRS 102 Appendix I].

5.4.1.A Use of the merger accounting method or the purchase method?

Group reconstructions meeting the specified conditions may be accounted for by using the merger accounting method. [FRS 102.19.27]. This suggests that use of the purchase method is also available for such group reconstructions.

How we see it

We believe that a receiving entity accounting for a group reconstruction can only apply the purchase method if the transaction has substance for the combining parties. If there is no substance to the transaction, the merger accounting method is the only method that can be applied to that transaction. If there is substance to the transaction, whichever accounting policy is adopted must be applied consistently to similar categories of transactions as required by Section 10 of FRS 102 (see Chapter 9 at 3.1 and 3.2). An entity needs to exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

In our view, where the purchase method is selected, the transaction must have substance from the perspective of the reporting entity. This is because the purchase method results in the reassessment of the value of the net assets of one or more of the entities involved and/or the recognition of goodwill. As discussed at 5 above, FRS 6 noted these as reasons why the purchase method may be inappropriate for some group reconstructions. Careful consideration is required of all of the facts and circumstances from the perspective of each entity, before it is concluded that a transaction has substance.

How we see it

Evaluating whether a group reconstruction (including a hive transaction) has substance will involve consideration of multiple factors, including (but not necessarily limited to):

- (a) Whether or not the transaction is a business combination
- (b) The purpose of the transaction
- (c) The involvement of outside parties in the transaction, such as non-controlling interest or other third parties
- (d) Whether or not the transaction is conducted at fair value
- (e) The existing activities of the entities involved in the transaction
- And
- (f) Whether or not it is bringing entities together into a reporting entity that did not exist before

Further discussion of the points is as follows:

- Whether or not the transaction is a business combination (see 3.2.1 above for a full discussion of the definition of a business and of a business combination). Importantly, Section 19 states that, "The result of nearly all business combinations is that one entity, the acquirer, obtains control of one or more other businesses, the acquiree." [FRS 102.19.3]. Therefore, if the transaction is not a business combination, use of the purchase method is generally not appropriate.
- The purpose of the transaction. It is important to understand the economics and objectives of a transaction in relation to all of the parties to it. These will often inform management's judgements as to the appropriate accounting.
- Whether or not the transaction is conducted at fair value. If the transaction is equivalent to an arm's length transaction between third parties, then it might be appropriate to apply the purchase method. An example of this is a business combination for which the consideration paid is cash or loan (with formally documented interest and/or repayment terms), of an amount commensurate to the fair value of the trade and assets acquired (i.e., of the business, including goodwill). It might often be difficult to obtain a reliable estimate of the fair value of shares issued by an entity as consideration for the transfer of the trade and assets in a group reconstruction. In addition, the economic substance of the transaction might be the same irrespective of the number of shares issued, for example, in a hive down to a wholly owned subsidiary.

- The existing activities of the entities involved in the transaction. It is relevant to consider the existing activities of the entities involved in the transaction and whether the transaction is bringing businesses together into a 'reporting entity' that did not exist before. Some transfers of businesses may be more in the nature of a continuation of an existing business (or part of a business) than a business combination. One example where this is relevant is in the case of a hive up (see 5.4.2 below). It may be difficult to categorise a hive up transaction as a business combination because there is no acquirer that obtains control of a business; the parent already controlled the business that has been transferred to it.
- Whether or not it is bringing entities together into a reporting entity that did not exist before. As discussed at 3.4.2 above, it is difficult to identify Newco as the acquirer in a business combination and so merger accounting is likely to be more appropriate where a business has been transferred to a Newco. However, a group reconstruction involving a Newco could be undertaken in connection with an IPO or spin off or other change in control and significant change in ownership and, in some circumstances, it might be possible to identify the Newco as the acquirer (see the discussion at 3.4.2 and 5.2.1.B above). The accounting will depend on a careful analysis of the facts and circumstances and ultimately requires judgement.

How we see it

In our view, the merger accounting method is often more appropriate for transactions involving share consideration.

If an entity concludes that use of the purchase method is appropriate for a particular transaction, then Section 19's requirements regarding the application of the purchase method apply. [FRS 102.19.6]. In particular, it is important to determine which party is the accounting acquirer (see 3.4 above).

Illustration 5-6: Determining if a group reconstruction has substance for applicability of the purchase method (1)

Entity A currently has two businesses operated through wholly owned subsidiaries Entity B and Entity C. The group structure (ignoring other entities within the group) is as follows:

Entity A proposes to combine the two complementary businesses (currently housed in two separate entities, Entity B and Entity C) into one entity, in anticipation of spinning off the combined entity by way of an IPO. Both businesses have been owned by Entity A for several years. The reorganisation will be structured such that Entity C will acquire the shares of Entity B from Entity A for cash at their fair value of £1,000. The carrying amount of the net assets of Entity B is £200 (both in the individual financial statements of Entity B and in the consolidated financial statements of Entity A). The net of the acquisition-date fair values of the identifiable assets acquired and liabilities assumed of Entity B (measured in accordance with Section 2A) is £600.

How would this transaction (to facilitate a subsequent spin-off) be accounted for in the consolidated financial statements of both Entity C and Entity A?

As far as Entity C is concerned, there is a business combination that needs to be accounted for. In this fact pattern, there is substance to the transaction. There is a business purpose to the transaction; it has been conducted at fair value; both Entity B and Entity C have existing activities; and they have been brought together into a reporting entity that did not exist before. Accordingly, Entity C can choose to apply either the purchase method or the merger accounting method in its consolidated financial statements. The selected accounting policy must be applied consistently to similar transactions.

If Entity C selects the purchase method, it will need to identify whether Entity C or Entity B is the acquirer (see 3.4 above). Assuming that Entity C is identified as the acquirer, in summary, this will mean that the net identifiable assets of Entity B will be initially reflected at their acquisition-date fair values (£600), together with goodwill of £400 (£1,000 less £600), in the consolidated statement of financial position.

As far as Entity A is concerned (i.e., from the perspective of the controlling party), there has been no change in the reporting entity - all that has happened is that Entity B, rather than being directly held and controlled by Entity A, is now indirectly held and controlled through Entity C (i.e., no change in control). Accordingly, there is no business combination and the effects resulting from the intragroup transaction are eliminated in full. Thus, the carrying amounts for Entity B's net assets included in the consolidated financial statements of Entity A do not change. There are also no non-controlling interests affected. The transaction therefore has no impact on the consolidated financial statements of Entity A (except for any potential tax consequences).

In Illustration 5-6 above, Entity C had to account for its business combination with Entity B, as it was preparing consolidated financial statements. In some situations, Entity C would not need to account for the business combination at all, as it might be exempt as an intermediate parent company from preparing consolidated financial statements (see Chapter 8 at 3.1.1). If in Illustration 5-6 above, Entity C had acquired the business of Entity B, rather than the shares, then the same accounting policy choice would have to be made for the business combination in Entity C's financial statements, even if they are not consolidated financial statements.

However, in other types of reorganisations, careful consideration of the factors above might indicate that there is no substance to the transaction. This is shown in Illustration 5-7 below.

Illustration 5-7: Determining if a group reconstruction has substance for applicability of the purchase method (2)

Entity A engages in different business activities in two geographical areas through four wholly owned subsidiaries (all owned for several years). Each subsidiary individually meets the definition of a business in FRS 102. Traditionally, the legal structure followed the geographical areas of operations. To align with its management structure, which is organised by business segment, Entity A proposes to reorganise its legal structure. This two-step process involves (i) Entity B distributing its shares in Entity D to Entity A, and (ii) Entity D acquiring the shares in Entity E. The transaction price for (ii) reflects the carrying amount of Entity E's net assets as included in the consolidated financial statements of Entity A. The group structure before and after this reorganisation is as follows:

Before

After

How would this transaction (to align the group's legal and management structure) be accounted for in the consolidated financial statements of both Entity A and Entity D?

As far as Entity A is concerned, neither its own acquisition of the shares in Entity D (by way of distribution from Entity B) nor the transfer of shares in Entity E from Entity C to Entity D represents a business combination. As described in Illustration 5-6 above, from the perspective of the controlling party, there is no change of control. Because there are also no non-controlling interests affected, the reorganisation has no impact on the consolidated financial statements of Entity A (except for any potential tax consequences).

In contrast, in the consolidated financial statements of Entity D, there is a business combination that needs to be accounted for. In this fact pattern, the transaction is bringing entities together into a reporting entity that did not exist before and both Entity D and Entity E have existing activities. Nevertheless, there is no substance to the transaction. There is no clear business purpose to the transaction; the restructuring is purely internal, with no external parties being involved; and the transaction is not conducted at fair value. Consequently, Entity D cannot apply the purchase method in its consolidated financial statements. This reorganisation will be accounted for using the merger accounting method.

5.4.1.B Transactions at undervalue and section 845 of the CA 2006

When an entity sells an asset (or a group of assets and liabilities, for example, a business) for an amount that is less than its fair value (including for nil consideration), the entity is making a transfer at undervalue because it is not receiving an arm's length consideration. Therefore, the entity must consider whether it is making a distribution under Part 23 of the CA 2006 and whether it has sufficient distributable reserves to do so. In the context of hive transactions, this is particularly relevant when the transaction involves a transfer of value from a group entity to its direct or indirect parent/owner or to a fellow subsidiary. An example of a transfer of value by the transferor (the selling entity) is a hive up or hive across in which the consideration received by the entity is less than the fair value of the trade and assets sold. An example of a transfer of value by the transferee (the purchasing entity) is a hive down or hive across in which the consideration paid by the entity exceeds the fair value of the trade and assets purchased.

It is not the intention of this publication to discuss all the requirements relating to the lawfulness of undervalue transactions, which is an area where an entity might need to obtain appropriate legal advice on the specific transaction. However, sections 845 and 846 of the CA 2006 are often relevant to such transactions and are briefly discussed below.

Section 845 of the CA 2006 applies to a company in determining the 'amount of a distribution' in relation to the sale, transfer or other disposition of a non-cash asset, providing that:

- The company has 'profits available for distribution' at the time of the distribution.
- And
- If the amount of the distribution were to be determined in accordance with section 845, the company could make the distribution without contravening Part 23 of the CA 2006.

For the purposes of section 845, the profits available for distribution are treated as increased by the amount (if any) by which the amount or value of the consideration for the disposition exceeds the book value of the asset. The book value of the asset is the amount at which the asset is stated in the relevant accounts of the transferor used to support the distribution (or if not stated in those accounts, nil). [s845]. Where any part of the amount at which the asset is stated in the relevant accounts represents an unrealised profit (for example, where an item of property, plant and equipment has been revalued), that profit is treated as a realised profit for the purpose of determining the lawfulness of the distribution. [s846].

If section 845 applies, the amount of the distribution is the amount by which the book value of the asset exceeds any consideration received. If the consideration exceeds the book value, the amount of the distribution is nil. [s845].

Illustration 5-8: Application of section 845

Entity A has a property, measured at cost less impairment, with a book value of £750,000. Entity A has distributable reserves of £600,000. Entity A sells the property to its parent, Entity P.

In the following scenarios, what is the amount of any distribution in law?

Entity A receives cash of the following amounts, from Entity P, in consideration for the property:

1. £750,000: Distribution is measured as (£750,000 - £750,000 = £nil).
2. £150,000: Distribution is measured as (£750,000 - £150,000 = £600,000).
3. £nil: Distribution would be measured as (£750,000 - £nil = £750,000). Entity A does not have sufficient distributable reserves for this transaction, so it cannot be conducted as planned (see discussion following Illustration 5-9 below).

Illustration 5-9: Application of sections 845 and 846

Entity B has a property, measured at revaluation under Section 17, with a carrying value of £900,000. Entity B purchased the property for £600,000 and the related revaluation reserve is £300,000. Entity B has distributable reserves of £150,000. Entity B sells the property to its parent, Entity P for £475,000.

The carrying value of the property exceeds the consideration received by £425,000 (£900,000 less £475,000), which is the amount at which the distribution is measured under section 845. Entity B has only £150,000 of reserves available for distribution. However, by virtue of section 846, the revaluation reserve of £300,000 is considered realised for the purpose of distributing the property to which the revaluation reserve relates. Therefore, total profits available for distribution are £450,000 which are sufficient to cover the amount of the distribution.

Detailed worked examples demonstrating the application of sections 845 and 846 are provided in the ICAEW/ICAS Technical Release TECH 02/17BL *Guidance on Realised and Distributable Profits under the Companies Act 2006*. [TECH 02/17BL Appendix 1].

It is important that the transferor company has positive profits available for distribution (as defined) sufficient to cover the amount of the distribution (as defined). In a transaction to sell an asset at book value, the amount of the distribution is nil but if the transferor has nil or negative profits available for distribution, it would not be able to enter into the transaction as planned. However, alternative structures for the transaction could be considered. For example, the buyer could pay an amount equal to fair value (in the case of a sale of trade and assets, the fair value of the business) for the transaction. The asset could also be sold at book value plus an amount exceeding the deficit on distributable reserves. (This is because, for the purposes of section 845, the profits available for distribution are treated as increased by the amount of any excess of the consideration for the transfer over the book value of the asset. While the amount of the distribution is nil, in order to effect the transaction, there must be a positive (not a nil) balance on profits available for distribution after such adjustment for that excess.) Another possibility is that the seller might be in a position to effect a capital reduction in order to create positive profits available for distribution prior to the transaction. An entity might often need to obtain legal advice in order to structure the transaction appropriately.

Undervalue transactions in group reconstructions are often undertaken in such a way that intermediate holding companies are affected. For example, one subsidiary sells its trade and assets to another, and there is an intermediate holding company between the selling subsidiary and the common parent of both the selling and buying subsidiaries. That intermediate holding company must also consider the adequacy of its distributable reserves (including the effects of any impairment in its investment in the subsidiary) when its subsidiary conducts a transaction at undervalue. [TECH 02/17BL.9.71]. See 5.4.3.B below.

5.4.1.C Balances arising from merger accounting and realised profits

As discussed at 5.4.6 below, application of merger accounting often results in balances within equity, which could be a debit or a credit. TECH 02/17BL contains guidance on debits within equity arising on group reconstructions. While this guidance is written in the context of IFRS 3, TECH 02/17BL explains that it is equally applicable to a group reconstruction accounted for under FRS 102. [TECH 02/17BL.9.41].

The guidance within TECH 02/17BL is as follows:

- Where the accounting is to recognise the net assets acquired at the transferor's book amounts (rather than at their fair values), the consideration payable may exceed the book amount of the net assets acquired. This will leave a debit difference to be recognised. It is not goodwill. The debit is sometimes referred to as a 'merger difference' and is recorded in equity. [TECH 02/17BL.9.36].
- A business combination involving members of the same group is completed under the direction of the controlling party, the common parent. Consequently, any excess paid by the acquirer over the book amount of the selling shareholder's net assets is accounted for in a similar manner to a distribution or return of capital to the common parent. Distributions and returns of capital are dealt with through equity, and therefore it is logical also to recognise the debit in equity. [TECH 02/17BL.9.37].
- Such a debit directly to equity is not necessarily, however, a distribution as a matter of law. This is because the debit described above is determined on a book basis, whereas the question as to whether there would be an actual distribution is determined by whether the company gives consideration other than an issue of its shares, to its parent or a fellow subsidiary, with a fair value in excess of the fair value of the net assets and business acquired. Accordingly, the debit might form part of an actual distribution or might not. [TECH 02/17BL.9.38].
- In a case where the debit in equity does not form part of an actual distribution, then at the date of acquisition the debit does not represent a loss; the acquiring company has purchased net assets worth at least the book value of the consideration given but, under the appropriate accounting, has recognised these at a lower amount. The difference between the two is the amount of the debit. As the debit is not a loss at all, it is neither realised nor unrealised. However, it can subsequently become a realised loss. [TECH 02/17BL.9.39].
- To the extent that the assets, if they had been recognised at the higher amount, together with any goodwill that would have been recognised, would have been written down, say, by depreciation or impairment, an equivalent amount of the debit becomes a realised loss. It is a realised, rather than unrealised, loss because, had the debit been carried as an asset, any write down for depreciation or impairment would be required, by section 841 and the principles of realisation, to be regarded as realised. [TECH 02/17BL.9.40].

A debit adjustment to reserves in a public company would result in a restriction to the reserves available for distribution via the 'net assets test' in section 831 of the CA 2006. [s831, TECH 02/17BL.9.42].

The guidance in TECH 02/17BL discussed above deals with the situation where there is a net debit to be taken to equity as a result of merger accounting. However, for some group reconstructions, the net amount to be recognised is a credit (see 5.4.6 below). In determining whether this credit represents realised profits or not, reference must be made to the guidance in TECH 02/17BL. Paragraph 3.18 of TECH 02/17BL recommends a 'top slicing' approach in determining realised profits for exchanges of assets where the consideration received is partly 'qualifying' consideration and partly other consideration. This means that where an asset is sold partly for qualifying consideration and partly for other consideration (for example, a mixed consideration of cash and a freehold property), any profit arising is a realised profit to the extent that the fair value of the consideration received is in the form of qualifying consideration.

[TECH 02/17BL.3.18]. Paragraph 3.18A expands on the application of 'top slicing' when the consideration received comprises a combination of assets and liabilities. For example, this will often be the case on a transfer of trade and assets for no consideration. The guidance states that any liabilities are first deducted from the amount of qualifying consideration received; therefore, the profit will be realised only to the extent of any net balance (i.e., cash less liabilities) of qualifying consideration received. [TECH 02/17BL.3.18-+18A].

5.4.2 Hive up transactions

5.4.2.A Hive up immediately after acquisition

Illustration 5-10: Hive up immediately after acquisition

Fact pattern

1. Company A acquires Company B on 31 December 20X6 in a business combination for £5,000 cash. Company B has net assets with a book value in its individual financial statements of £2,800 and a fair value of £3,500 (including deferred tax adjustments arising on the business combination). Goodwill of £1,500 arises in the consolidated financial statements of Company A, also prepared under FRS 102.
2. On 1 January 20X7, Company B sells its trade and assets to Company A in consideration for an intercompany receivable of £2,800 equal to the book value of net assets in Company B's individual financial statements.
3. Company B has positive distributable reserves (see 5.4.1.B above).
4. Company A prepares consolidated and individual financial statements under FRS 102. Company A and Company B use consistent accounting policies.
5. Company A uses the merger accounting method for the hive up (see 5.4.1.A above). However, in this particular case of a hive up immediately after acquisition, using the merger accounting method achieves the same result as applying the purchase method.

Analysis

In using the merger accounting method, Company A must determine which are the appropriate book values of net assets of Company B to use, those from its consolidated financial statements or from Company B's individual financial statements.

How we see it

In our view, it is generally appropriate for Company A to use the consolidated book values of net assets (including goodwill) relating to Company B's trade and assets. This reflects the substance of the transaction, which is equivalent to Company A purchasing the trade and assets directly from the third party, combined with the acquisition of a cash shell, Company B. Using the consolidated book values has the effect that the same assets (including goodwill) and liabilities are presented in relation to the trade and assets acquired in both the consolidated and individual financial statements of Company A.

Company B is selling its trade and assets for a consideration equal to the book value of the net assets in its individual financial statements, which is less than fair value of the trade and assets (i.e., the business). Since it

has positive distributable reserves, section 845 applies (see 5.4.1.B above) and, in this case, because Company B receives an intercompany receivable equal to the book value of its net assets, the amount of the distribution is measured at nil.

The hive up results in the following entries in Company A's separate financial statements and Company B's individual financial statements:

<i>Company A</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Investment in Company B	5,000	
Cash		5,000
To record the initial purchase of Company B		
Goodwill	1,500	
Net assets (at acquisition date fair value)	3,500	
Intercompany payable		2,800
Investment in Company B		2,200
To record the hive up transaction		

The credit to investment is in substance part of the consideration for the hive up. The remaining investment balance of £2,800 is supported by the intercompany receivable in Company B (see below). For a discussion of impairment following a hive up, see 5.4.2.E below.

<i>Company B</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Intercompany receivable	2,800	
Net assets		2,800
To record the hive up transaction		

5.4.2.B Other forms of consideration

It is unlikely that a hive up would be effected by shares since this would result in the subsidiary holding shares in its parent, which is generally prohibited by section 136 of the CA 2006. [s136].

If Company B gifted its business to its parent Company A i.e., for nil consideration, it would need sufficient profits available for distribution to cover the book value of the net assets distributed. In this example, this would have the effect that, instead of the intercompany receivable recorded above, a distribution in equity would be recorded for the same amount. An entity would never have quite sufficient reserves to distribute the entirety of its net assets because some of those net assets will be represented by share capital and premium. An entity might need to obtain legal advice in order to structure the transaction appropriately. For example, Company B might conduct a capital reduction in advance of the hive up (although one share, that is not a redeemable share, must always be left outstanding) and a nominal consideration could be paid for any share capital remaining. [s641].

Company A would record the same goodwill and net assets for the hive up of Company B's trade and assets as shown in the example above, together with a credit to the carrying amount of its investment in Company B of £5,000 (less any amount supported by nominal consideration paid to Company B).

5.4.2.C Hive up sometime after acquisition

Illustration 5-11: Hive up sometime after acquisition

Fact pattern

1. Assume the facts are the same as Illustration 5-10, at 5.4.2.A above, but Company B was acquired on 31 December 20X3 by Company A. Since acquisition, Company B has recorded profits of £600 per year in its individual financial statements. Goodwill is amortised over 10 years, and the property is depreciated over 30 years from the acquisition date.
2. On original acquisition, in Company A's consolidated financial statements, property that was recorded in Company B's individual financial statements at historical cost of £125 was ascribed a fair value of £1,000. A deferred tax liability of £219 (at a substantively enacted tax rate of 25%) arose on the fair value adjustment ($25\% \times (£1000 - £125)$), giving a net of tax adjustment to the fair values of the identifiable net assets acquired of £656.
3. On 1 January 20X7, Company B sells its trade and assets to Company A, in consideration for an intercompany receivable of £4,600 (£2,800 plus £1,800 cumulative profits for three years) equal to the book value of net assets in Company B's individual financial statements.
4. Company B has positive distributable reserves (see 5.4.1.B above).
5. Company A prepares consolidated and individual financial statements under FRS 102. Company A and Company B use consistent accounting policies.
6. Company A uses the merger accounting method to account for the transaction in its individual financial statements.

Analysis

As in Illustration 5-10 at 5.4.2.A above, Company A must determine which are the appropriate book values of net assets of Company B to use, those from its consolidated financial statements or from Company B's individual financial statements.

How we see it

In our view, it would generally be most appropriate to use the consolidated book values of the net assets (including goodwill) relating to Company B's trade and assets.

If, as seems likely, the fair value of the trade and assets transferred exceeds the consideration received (based on the book value of the related net assets in its individual financial statements), Company B would be making an undervalue transfer (see 5.4.1.B above). However, since Company B has positive distributable reserves and is paid book value for its net assets, the amount of the distribution is zero in accordance with section 845 and there is also no accounting effect of the distribution to reflect in Company B's equity.

The hive up results in the following entries in Company A's separate financial statements and Company B's individual financial statements:

Company A	Dr	Cr
	£	£
Goodwill ¹	1,050	
Net assets ²	5,234	
Intercompany payable		4,600
Investment ³		400
Merger reserve ⁴		1,284

To record the hive up transaction

¹Goodwill of £1,500 arising on original acquisition has been amortised for three years at £150 per year. Note that goodwill is not remeasured at the date of hive up.

²Net assets of Company B in Company A's consolidated financial statements are £3,500 at the date of acquisition and Company B has made £1,800 cumulative profits in the three years post-acquisition. There was a fair value adjustment on property of £656 (net of deferred tax), depreciated for three years of its 30-year useful economic life, giving accumulated depreciation net of unwind of deferred tax of £66. Therefore, the net assets of Company B in A's consolidated financial statements at the date of hive up are £5,234 (£3,500 plus £1,800 less £66).

³Company A's investment has been written down to the amount that can be supported by the intercompany receivable in Company B of £4,600: i.e., £5,000 (from original acquisition) less £4,600. For a discussion of impairment following a hive up, see 5.4.2.E below.

⁴An adjustment in equity, sometimes to a separate reserve (in this example, the merger reserve), is recorded for the merger accounting difference arising. [FRS 102.19.31]. The merger reserve represents the cumulative profits made by Company B as shown in Company A's consolidated financial statements, i.e., cumulative profit of £1,800 less £66 net depreciation/deferred tax unwind on the property fair value adjustment less goodwill amortisation of £450. The reserve would be assessed to determine whether any amount of it represents a realised profit using the guidance in TECH 02/17BL (see 5.4.1.C above).

<i>Company B</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Intercompany receivable	4,600	
Net assets		4,600
To record the hive up transaction		

For other forms of consideration, there are similar considerations to those discussed in at 5.4.2.B above.

5.4.2.D Hive up of a business not previously acquired

Illustration 5-12: Hive up of a business not previously acquired

Fact pattern

1. Company B has been owned by Company A since incorporation. Company A has an investment in Company B of £1,000.
2. On 1 January 20X7, Company B sells its business (trade and assets) to Company A, in consideration for an intercompany receivable equal to the book value of net assets (relating to that business) of £4,600 in Company B's individual financial statements.
3. Company B has positive distributable reserves before and after the transaction (see 5.4.1.B above).
4. Company A prepares consolidated and individual financial statements. Company A and Company B use consistent accounting policies.
5. As in Illustration 5-10 (at 5.4.2.A above) and illustration 5-11 (at 5.4.2.C above), Company A uses the merger accounting method for the hive up in its individual financial statements.

Analysis

This may be an undervalue transfer if the fair value of the trade and assets exceeds the book value of the related net assets in Company B's individual financial statements. Since Company B has positive distributable reserves and is paid book value for the net assets, the amount of the distribution is nil in accordance with Section 845 and there is also no accounting effect of the distribution to reflect in Company B's equity.

In this case, the book values of the net assets of the business hived up are the same in the individual financial statements of Company B and the consolidated financial statements of Company A and, therefore, are the only book values that can be used to account for the hive up in Company A's individual financial statements. More generally, the book values of net assets from a selling subsidiary's individual financial statements could be subject to accounting policy alignment.

Therefore, the accounting in both companies is straightforward, since both companies recognise/derecognise net assets at the book value of £4,600 and an equivalent intercompany balance. In this example, the carrying amount of the investment in Company B remains supported by the intercompany receivable of £4,600 held by Company B. In situations where the investment carrying amount would not be supported as a consequence of the hive up, a credit to the investment would be recorded with an adjustment to equity for any difference between the net assets recorded in Company A's books and the credit to the cost of investment.

For a discussion of impairment following a hive up, see 5.4.2.E below.

5.4.2.E Assessing the parent's carrying value of investment for impairment

After a hive up, the parent company may need to assess whether the carrying value of its investment in the subsidiary transferring its trade and assets remains recoverable.

In Illustration 5-12 at 5.4.2.D above, it is clear that there is no impairment since the intercompany receivable of £4,600 held by Company B following the hive up is in excess of the investment of £1,000. However, in other cases, there might be an apparent 'impairment' in value, if the carrying value of the parent's investment exceeds the consideration given for the hive up.

Illustration 5-13: Debit merger difference ('impairment') arises on hive up*Fact pattern*

1. Company A acquired Company B on 31 December 20X3, for a fair value of £10,000, when Company B's net assets were stated in its individual financial statements at £6,000.
2. On 1 January 20X7, Company B sells its trade and assets to Company A in consideration for an intercompany receivable of £7,500 equal to the book value of net assets in Company B's individual financial statements.
3. On 1 January 20X7, the carrying value of Company B's net assets (including goodwill) from Company A's consolidated financial statements is £11,500.
4. Company B has positive distributable reserves (see 5.4.1.B above).
5. The value in use/fair value of Company B supported the carrying value of Company A's cost of investment of £10,000 prior to the hive up. There is no remaining trade in Company B after the hive up.
6. Company A applies merger accounting and recognises the net assets of Company B at their book values from Company B's individual financial statements, i.e., £7,500, and an intercompany payable for the same amount.

Analysis

Subsequent to the hive up, Company A assesses its investment in Company B and identifies that the intercompany receivable of £7,500 held by Company B does not support the investment carrying value of £10,000. There is an apparent 'impairment' of £2,500. However, Company A has suffered no loss and so it would not be appropriate for it to recognise an impairment loss in profit or loss as a result of the hive up. This is because there is no change to the net assets that it controls; they have simply moved between the legal entities. Company A must recognise the reduction in the cost of investment, which is in substance part of the consideration paid by Company A for the hive up. Therefore, it is appropriate to consider the debit of £2,500 as a merger accounting difference to be recognised in equity in Company A. It is not goodwill, since the application of the merger accounting method does not result in the recognition of new goodwill. [FRS 102.19.31]. See 5.4.1.C above for a discussion of whether such merger accounting differences result in realised profits and losses.

How we see it

In our view, accounting for the hive up using the book values of the net assets (including goodwill) of the subsidiary in the consolidated financial statements generally avoids or mitigates an overall debit arising on the transaction. This is because the investment is essentially exchanged for the net assets (including goodwill) relating to the hive up as included in the consolidated financial statements.

If this were the appropriate accounting in Company A, the amounts it would record are:

Company A	Dr	Cr
	£	£
Net assets	11,500	
Intercompany payable		7,500
Investment ¹		2,500
Merger reserve ²		1,500

To record the hive up transaction

¹To write down the investment to the amount receivable in Company B.

²An adjustment in equity, sometimes to a separate reserve (in this example, the merger reserve), is recorded for the merger accounting difference arising. [FRS 102.19.31]. The reserve would be assessed to determine whether any amount of it represents a realised profit using the guidance in TECH 02/17BL (see 5.4.1.C above).

Although the investment is written down to the same amount (£7,500) using the book values of Company B from either Company B's individual financial statements or Company A's consolidated financial statements, when the latter amounts are used to account for the hive up, no overall debit arises on the transaction. Instead, a credit balance arises of £1,500, essentially representing the increase in the consolidated net assets (including goodwill) of Company B since its original acquisition, which is reflected in the net assets recorded on the hive up, but not in the consideration that was agreed between the two parties.

Care must be taken that any genuine impairment in the parent's investment in its subsidiary, i.e., one resulting from factors other than the hive up, is identified and recognised appropriately in the parent's profit or loss. This is because otherwise a debit merger accounting difference recorded in equity may inappropriately include a true impairment loss.

5.4.3 Hive across transactions

Similar issues arise when considering a hive across transaction, as when considering a hive up (see 5.4.2 above): the seller must consider whether it is making a sale at undervalue (see 5.4.1.B above), and the buyer must consider the appropriate basis on which to recognise the net assets acquired in its individual financial statements (see 5.4.1.A above).

5.4.3.A Hive across for intercompany consideration

Illustration 5-14: Hive across for intercompany consideration

Fact pattern

1. On 1 January 20X7, Company B transfers its trade and assets to its fellow subsidiary Company C, for an intercompany receivable of £6,000 equal to the book value of Company B's net assets in its individual financial statements.
2. The fair value of Company B's trade and assets (i.e., the business) is £12,500 at the date of transfer.
3. Company B has positive distributable reserves (see 5.4.1.B above).
4. Company A prepares consolidated and individual financial statements under FRS 102. Company A, Company B and Company C use consistent accounting policies.
5. Company A has a cost of investment in Company B of £7,000 and in Company C of £1,000.
6. Company A's consolidated financial statements at 31 December 20X6 show amortised goodwill of £1,500 and net assets of £8,500 in respect of Company B's trade and assets, as Company A had acquired Company B in a previous transaction.

Analysis

As discussed at 5.4.1.A above, Company C must determine whether to apply the merger accounting method or the purchase method to the hive across.

How we see it

If Company C applies the merger accounting method to the hive across, it must consider which book values of net assets to use, those from Company B's individual financial statements or from Company A's consolidated financial statements. Which is most appropriate will depend on specific facts and circumstances. Since Company B has been previously acquired, using the book values of net assets (including goodwill) from the consolidated financial statements could be more appropriate. There could be other circumstances in which the book values from Company B's individual financial statements would be considered most appropriate, for example, if the substance of the transaction were a continuation of the trade and assets hived across, as would be the case if Company C were newly incorporated for the purpose of the transaction.

If Company C uses the consolidated book values of net assets (including goodwill), the accounting is similar to that shown in Illustration 5-11 at 5.4.2.C above, except that a credit to equity (for example, to a separate merger reserve) will arise for all of the difference between the book values recognised and the consideration given of £6,000, and there is no investment to be credited.

If, in different circumstances, Company C were to use the individual book values of net assets, the accounting is similar to that shown in Illustration 5-13 at 5.4.2.E above, with net assets and an intercompany payable recognised of £6,000.

Where Company C uses the consolidated book values of net assets (including goodwill), the accounting in each of Companies B and C is as follows:

<i>Company C</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Goodwill	1,500	
Net assets	8,500	
Intercompany payable		6,000
Merger reserve ¹		4,000

To record the hive across transaction

¹See 5.4.1.C above for a discussion of whether such merger accounting differences result in realised profits and losses.

<i>Company B</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Intercompany receivable	6,000	
Net assets		6,000

To record the hive across transaction

The common parent, Company A, must also consider the effect of the hive across on its financial statements. In the consolidated financial statements, the transaction has no effect. In Company A's individual financial statements, there is a cost of investment in Company B of £7,000 but Company B contains only a receivable of £6,000. On the face of it, there is an apparent 'impairment' in the cost of investment in Company B, but Company A has suffered no loss because it has simply transferred assets from one subsidiary to another. Therefore, it would be inappropriate to recognise an impairment loss in Company A's profit or loss.

How we see it

In our view, it is appropriate for Company A to reallocate an appropriate amount of its investment in Company B to its investment in Company C. Company A's total investment in its subsidiaries B and C remains the same.

5.4.3.B Intermediate parent companies in a hive across transaction

When there is an intermediate parent above the seller in a hive across (for example, between Companies A and B in Illustration 5-14 at 5.4.3.A above), there are further legal and accounting considerations for the intermediate parent.

This situation is addressed by TECH 02/17BL which highlights that such transactions have potential to be unlawful, even if the intermediate parent suffers no accounting impairment loss. TECH 02/17BL states that when the seller transacts at an undervalue (see 5.4.1.B above) the actual value of the intermediate parent's investment in its subsidiary is diminished by the transfer, and so it is possible that knowledge of the proposed transaction and passive acquiescence in it may result in its being, in law, a distribution by the intermediate parent. If so, and if the intermediate parent has insufficient profits available for distribution, then it will be unlawful. [TECH 02/17BL.9.71].

Another issue for intermediate parents to consider is whether an impairment of the cost of investment in the selling subsidiary (or in any intermediate parent companies in the group structure above the selling subsidiary) arises as a result of the hive across transaction. If the business remaining in the selling subsidiary after a hive across does not support the carrying value of the investment in the selling subsidiary, its immediate parent company may need to recognise an impairment loss. This could also affect subsequent intermediate parent companies up the chain in the group structure. This does not affect the common parent company of the buying and selling subsidiaries but may affect intermediate parents above the selling subsidiary as far as the common parent. See Illustration 5-14 at 5.4.3.A above for considerations of the common parent in a hive across.

5.4.3.C Other forms of consideration

Similarly to a hive up transaction, it is unlikely that a hive across would be effected by shares since this would result in cross-holdings within the group, which may add complexity to a group structure.

If Company B gifted its business to Company C i.e., for nil consideration, the considerations and accounting for Company B would be similar to those described in 5.4.2.B above.

Company C would record a credit to equity, representing the capital contribution of a gifted business. Capital contributions are assessed to determine whether any portion represents a realised profit in accordance with section 3 of TECH 02/17BL.

As discussed in Illustration 5-14 at 5.4.3.A above, Company A must consider whether the carrying amount of its investment in Company B remains recoverable, and may need to reallocate an appropriate amount of its investment in Company B to its investment in Company C.

5.4.4 Hive down transactions

5.4.4.A Hive down for share consideration

Illustration 5-15: Hive down for share consideration

Fact pattern

- On 1 January 20X7, Company A transfers its trade and assets to Company B, its wholly owned subsidiary, in exchange for the issue of shares from Company B, with nominal value of £300.
- The book value of net assets in Company A's financial statements immediately before transfer is £2,500 and comprise property of £1,100, inventory of £1,200, trade receivables of £700, £500 of cash, and payables of £1,000.
- Company A is not part of a wider group. Therefore, the book values of its net assets are the same in the individual and consolidated financial statements that contain Company A.
- Company A has a policy of revaluation of property, which is stated in its financial statements at 31 December 20X6 at £1,100. Its original cost was £700.
- Company A and Company B prepare financial statements. Company A and Company B use consistent accounting policies.

Analysis

As discussed at 5.4.1.A above, Company B must determine whether to apply the merger accounting method or the purchase method to the hive down.

Company B applies the merger accounting method to the hive down and so recognises the net assets of £2,500. Group reconstruction relief is relevant to this transaction since Company B, a wholly owned subsidiary, is issuing shares to its parent Company A for consideration that is (at least in part) non-cash assets. [s611]. While group reconstruction relief is optional (see Chapter 8 at 4.2.1), Company B chooses to make use of this relief.

Group reconstruction relief establishes the 'minimum premium value' to be recognised in the share premium account. For further discussion and examples of the operation of group reconstruction relief, see 5.5.2 below and Chapter 8 at 4.2.1. In this example, Company B is required to recognise a minimum premium value, which is the amount (if any) by which the 'base value' of the consideration for the shares allotted (being the base value of the assets transferred less the base value of any liabilities of the transferor company assumed by the issuing company) exceeds the aggregate nominal value of the shares. [s611].

The base value of the assets transferred is taken as:

- The cost of those assets to the transferor company
- Or
- If less, the amount at which those assets are stated in the transferor company's accounting records immediately before the transfer

The base value of the liabilities assumed is taken as the amount at which they are stated in the transferor company's accounting records immediately before the transfer. [s611].

Broadly speaking, the base value is often equal to the book value of the assets and liabilities in the transferring entity's records immediately before transfer, although this would not be true of assets carried at fair value or valuation, if the resulting carrying amount is higher than the original cost to the transferor.

In this example, the base value of the property is its original cost of £700. The base value of the remaining assets and liabilities is the book value of £1,400.

Therefore, Company B recognises the following accounting entries:

<i>Company B</i>	<i>Dr</i>	<i>Cr</i>
	£	£
Net assets	2,500	
Share capital ¹		300
Share premium (minimum premium value) ²		1,800
Merger reserve ³		400
To record the hive down transaction		

¹ Recognised at the nominal value of shares issued.

² Base value of net assets is £2,100 (£700 property plus £1,400 other net assets). Minimum premium value is the base value less the nominal value of shares issued of £300.

³ The difference above of £400, between the book value of net assets recognised and the required entries to share capital and premium, arises as a result of the revaluation of property of £400. This difference can be credited to an unrealised reserve where group reconstruction relief is taken.

Company A must derecognise its net assets and recognise the investment in Company B arising from the issue of shares.

How we see it

If it is determined that the transaction lacks substance for Company A, since it has simply swapped a direct investment in trade and assets for an indirect investment in the same trade and assets, via Company B, then Company A recognises the additional cost of investment in Company B at the carrying amount of the net assets given up. This accounting would usually be appropriate if Company B were a newly incorporated company or when Company B is wholly owned.

If a hive down transaction is considered to have substance to Company A (for example, this might be the case if Company B is not a wholly owned subsidiary), it could choose to recognise its additional investment in Company B at the fair value of the consideration given, i.e., the fair value of the trade and assets given up, as long as the fair value can be reliably measured. Any gain recognised as a result of this accounting would be unrealised and recognised in other comprehensive income, since the additional investment received in Company B, an unquoted subsidiary, would not be regarded as qualifying consideration.

If the fair value of the trade and assets given up cannot be reliably measured, then Company A recognises the additional cost of investment in Company B at the carrying amount of the net assets given up.

5.4.4.B Other forms of consideration

If the consideration paid is cash or other monetary assets such as a receivable, under merger accounting, any difference between the book values of net assets recognised and the consideration paid would be recognised in equity.

If Company B overpays for the trade and assets of its parent (including goodwill), in comparison to their fair value, this could be a distribution of value to its parent. See 5.4.1.B above.

In Company A, any excess of consideration received over the carrying amount of the net assets sold would be recognised as a gain. If realised, the gain will be recognised in profit or loss; if unrealised, the gain will be recognised in other comprehensive income. The gain will be realised only if the consideration represents qualifying consideration (see section 3 of TECH 02/17BL). Care must be taken in determining whether an intercompany receivable represents qualifying consideration.

If the consideration is less than the net assets sold or there is no consideration (a gift), Company A is making a capital contribution to its wholly owned subsidiary. The difference would be debited to its investment in Company B, which is then assessed for impairment. In Company B, the gift of Company A's business would result in a credit to equity, for example, to a merger or capital contribution reserve. Whether this reserve is realised or not is assessed using the guidance in TECH 02/17BL, discussed at 5.4.1.C above.

5.4.5 Financial information prior to the date of the combination

The description of the merger accounting method explicitly requires the results (and cash flows) of all combining entities (excluding those subsidiaries that are not consolidated under paragraphs 9.9 and 9.9A of FRS 102) to be included from the beginning of the financial year and for comparatives to be restated. [FRS 102.19.30]. While these paragraphs are framed in the context of a parent combining with a new subsidiary and will apply to consolidated financial statements prepared by the parent, the definition of a group reconstruction includes, for example, the hive transactions discussed at 5.4.1 to 5.4.4 above.

Application of the requirement to restate comparative information for such transactions, [FRS 102.19.30], would mean that the entity accounting for the acquired business under the merger method of accounting would include the results of that business from the beginning of the financial year and in the comparative year in its individual financial statements. However, in the context of individual financial statements, consideration needs to be given to paragraph 13(a) of Schedule 1 to the Regulations which requires that only profits realised at the reporting date are included in profit or loss. [FRS 102.A3.25]. This results in two possible approaches, of which the former is most common practice (note that legal mergers can create complexities and are not addressed in this guidance):

- Since the pre-transaction profits of the acquired business are not profits (and consequently cannot be realised profits) of the acquiring entity, they must not be included in the acquiring entity's profit and loss account. For UK companies, the Regulations require that only realised profits (with limited exceptions relating to the fair value accounting rules) are included in the profit and loss account. [1 Sch 13, 1 Sch 40]. The acquiring entity 'merger accounts' in its individual financial statements on a prospective basis only from the date of transfer, rather than reflecting the acquired business from the beginning of the financial year and for comparative periods.
- Or
- If the profits of the acquired business represented realised profits of that business, the acquiring entity could reflect the transfer from the beginning of the financial year and comparatives could be restated. The fact that the cumulative pre-transaction profits of the acquired business are not realised profits of the acquiring entity could be dealt with by disclosure or by transferring those profits to a 'non-distributable' reserve.

How we see it

FRS 102 does not explicitly deal with restatement of comparative information in standalone accounts subject to hive transactions. In our view, in the statutory accounts of a UK company, the pre-transaction profits of the acquired business are not profits of the acquiring entity and, therefore, must not be included in the acquiring entity's profit and loss account.

This does not preclude presentation of the pre-transaction and comparative profits using the second approach on a pro forma basis. Such information may be particularly relevant where a group reconstruction represents the continuation of an existing business, for example, where a business is transferred to a newly incorporated group entity. However, such pro forma figures are not required to be given. In this context, it is notable that the Statement of Recommended Practice *Accounting by Limited Liability Partnerships* ('LLP SORP') issued by CCAB effective for LLPs adopting FRS 102 recommends use of the first approach in relation to the application of merger accounting on initial transition of an existing entity to a single-entity LLP for the same reasons as explained above. However, the LLP SORP also considers that the second approach gives relevant information and recommends presentation of pro forma numbers on that basis. [LLP SORP Appendix 4].

Where the company applying the merger method of accounting to a hive transaction is a newly incorporated company, the company law requirements relating to a company's first accounting period will also need to be considered (see 5.4.7 below). This will further restrict the capability of including the pre-transaction results of the acquired business and is another reason for using a prospective approach.

5.4.6 Equity eliminations

As discussed at 5.3.3 above, the merger method of accounting under FRS 102 involves an equity elimination relating to the difference between the share capital of the new subsidiary (and any share premium or capital redemption reserve) and the cost of the investment as stated in the balance sheet of the new holding company.

However, in the context of applying the merger method in a hive transaction, there is no share capital (or share premium or capital redemption reserve) of the business transferred requiring elimination. Therefore, the difference to be shown as a movement on other reserves relates to the nominal value of any shares issued plus any share premium recognised plus the fair value of any other consideration given by the acquiring entity. This difference will generally be a debit to reserves (i.e., debit reserves, credit consideration transferred).

As indicated at 5.3.3 above, there are no particular requirements governing where to eliminate any debit adjustments in reserves arising on the application of the merger method of accounting in consolidated financial statements. The same is true for any debit adjustment for individual financial statements.

For some group reconstructions, the nominal value of the shares issued plus any share premium recognised plus the fair value of any other consideration given will be less than the book amount of the net assets acquired in the group reconstruction. In that situation, there will be a net credit to be taken to equity.

We recommend that the net credit is taken to a separate merger reserve.

Whether any net debit or credit arising from applying the merger accounting method represents a realised loss or profit is discussed at 5.4.1.C above.

5.4.7 Newly incorporated companies (Newcos)

It may be that in certain hive transactions involving the acquisition of the trade and net assets within the same group, the company acquiring the business is a newly incorporated company (Newco).

As discussed at 5.3.5 above, when a company is incorporated for the purpose of acting as the new parent company in a group reconstruction (Newco), it might not have been in existence for the entirety of the current and comparative period that would have been presented in respect of the transferred business if no reorganisation had occurred. In contrast to common practice in consolidated financial statements, individual financial statements cannot be prepared for a period prior to incorporation. In addition, as discussed at 5.4.5 above, hive transactions in individual financial statements of UK companies are accounted for prospectively from the date of the reorganisation. Therefore, Newco must present financial statements for its actual period since incorporation, recognising the hive transaction from the date that it takes place. However, if considered relevant, the pre-reorganisation period(s) could be given as supplementary pro forma information, as explained in Illustration 5-16 below.

Illustration 5-16: Hive transaction by a newly incorporated company

Parent A sets up a newly incorporated subsidiary, Subsidiary B, on 1 April 20X6 to effect a group reorganisation on 1 July 20X6 whereby Subsidiary B will acquire the trade and assets of an existing subsidiary of Parent A, Subsidiary C. All companies within Parent A's group have financial years ending on 31 December. Subsidiary B gives notice to have an accounting reference date of 31 December and will prepare its first individual financial statements made up to 31 December 20X6. In doing so, Subsidiary B will account for the acquisition of the former business of Subsidiary C under the merger method of accounting.

The CA 2006 requires that directors of a company prepare individual accounts for each financial year, [s394], and that a company's first financial year is required to begin with the date of its incorporation and end with its accounting reference date. [s391(5)]. In addition, Companies Act individual accounts must, in the case of the profit and loss account, give a true and fair view of the profit or loss of the company for the financial year. [s396(2)(b)].

Accordingly, the statutory individual financial statements of Subsidiary B can only be for the 9-month period from the date of its incorporation. Also, Subsidiary B includes the results of the business acquired from 1 July 20X6 in its individual financial statements. However, if it wished to present information about its underlying business for what it might consider to be for a more relevant period, i.e., for the year ended 31 December 20X6 (with comparatives for the year ended 31 December 20X5), it could do so in supplementary pro-forma form.

This approach is recommended in the LLP SORP in relation to the application of merger accounting on initial transition of an existing entity to a single-entity LLP for the same reasons as explained at 5.4.5 above. [LLP SORP Appendix 4].

5.5 Implications for the share premium account

Under the CA 2006, a company issuing shares at a premium must transfer “a sum equal to the aggregate amount or value of premiums on those shares” to an account called “the share premium account”. [s610(1)].

UK company law includes certain reliefs - ‘merger relief’ and ‘group reconstruction relief’ - from recognising share premium at all, or in full, where certain conditions are met. These reliefs, which are discussed further below, impact the accounting considerations for capital and reserves of the issuing entity only, but are not relevant for the purposes of measuring the cost of the combination in connection with application of the purchase method.

The implications of these reliefs in measuring the cost of investments in subsidiaries in separate financial statements are discussed further in Chapter 8 at 4.2.1.

5.5.1 Merger relief

The rules on merger relief and those on merger accounting are frequently confused with each other. However, not only are they based on the satisfaction of different criteria but they, in fact, have quite distinct purposes. As discussed at 5.3 above, merger accounting is a form of financial reporting which applies to a group reconstruction meeting certain qualifying conditions, but although the merger relief provisions were originally brought in to facilitate merger accounting, merger relief is purely a legal matter to do with the maintenance of capital for the protection of creditors and has very little to do with accounting *per se*. Moreover, merger relief may be available under transactions which are accounted for as acquisitions, rather than mergers, and the two are not interdependent in that sense.

Section 612 of the CA 2006 relieves the issuing company from the requirement in section 610 of the CA 2006 of establishing share premium on shares issued meeting certain conditions. This is known as ‘merger relief’. This usually arises in transactions involving a share for share exchange in which the issuing company has secured at least a 90% equity holding in the other company (as explained further below).

However, if the transaction falls within section 611 of the CA 2006 (‘group reconstruction relief’), section 612 does not apply to the transaction. [s612(4)]. Section 611 is discussed at 5.5.2 below and requires a ‘minimum premium value’ to be recognised in the share premium account in certain circumstances.

Merger relief applies where the issuing company has secured at least a 90% equity holding in another company in pursuance of an arrangement providing for the allotment of equity shares in the issuing company on terms that the consideration for the shares allotted is provided by:

- The issue or transfer of the issuing company of equity shares in the other company
- Or
- The cancellation of any such shares not held by the issuing company

A company secures at least a 90% equity holding in another company if, in consequence of an acquisition or cancellation of equity shares in another company (in pursuance of that arrangement), it holds equity shares of an aggregate amount equal to 90% or more of the nominal value of that other company’s equity share capital (or of each class of that other company’s equity share capital, where divided into different classes).

For this purpose, shares held by the issuing company, its holding company or subsidiary (or its or their nominees) contribute to the equity holding achieved, and any shares held by the other company as treasury shares, are excluded in determining the nominal value of the other company’s equity shares.

It does not matter whether any of the other company’s shares were acquired in pursuance of the arrangement. Consequently, the relief could apply both to equity shares issued in exchange for equity shares in another company which lead to the issuing company having at least a 90% equity holding and to equity shares issued in exchange for equity shares in another company after a 90% equity holding has already been achieved.

Where the conditions are met, section 612 relieves the issuing company from the requirement in section 610 to establish share premium on those shares.

Moreover, if the arrangement also provides for allotment of any shares in the issuing company on terms that the consideration for the shares is to be provided by (a) the issue or transfer to the issuing company of non-equity shares in the other company or (b) by the cancellation of any such shares in that company not held by the issuing company, the relief from establishing share premium extends to any shares in the issuing company allotted on those terms in pursuance of the arrangement.

The precise wording of section 612 (and related sections 613, 615 and 616) need to be considered carefully in order to ensure that any particular transaction falls within its terms. [s612, s613, s615, s616]. In particular, the references to 'equity shares' mean shares comprised in a company's equity share capital, and 'non-equity shares' to shares of any class that are not equity shares. [s548, s616]. See Chapter 8 at 4.2.1.

Over the years there have been some differences of legal opinion as to whether merger relief is in fact compulsory when the conditions of section 612 are met, or whether it is optional. The CA 2006 says that where the conditions are met, then section 610 "does not apply to the premiums on those shares" issued. Therefore, some people argue that the effect of this relief is simply to make section 610 optional rather than mandatory, but the more prevalent view is it makes it illegal to set up a share premium account. Therefore, if a company wishes to set up a share premium account where merger relief is available, the directors might wish to take legal advice.

Where merger relief is taken, and the purchase method is applied, as the cost of the business combination is based on the fair value, any amount that would have been taken to share premium account needs to be reflected in another reserve, generally a 'merger reserve' in the consolidated financial statements. Where merger accounting is applied, such an amount is not reflected in any 'merger reserve' as the mechanics of merger accounting uses the nominal value of shares issued. Whether such a reserve arises in the separate financial statements is discussed in Chapter 8 at 4.2.1.

5.5.2 Group reconstruction relief

Section 611 of the CA 2006 provides a partial relief from the basic requirement to Section 610 as regards transfers to the share premium account where the issuing company is a wholly-owned subsidiary of another company ('the holding company') and allots shares to that other company or another wholly-owned subsidiary of the holding company in consideration for the transfer to the issuing company of non-cash assets of a company ('the transferor company') that is a member of the group of companies that comprises the holding company and all its wholly-owned subsidiaries. [s611(1)].

Application of the relief in this instance means that just a 'minimum premium value' is required to be transferred to the share premium account - that amount being the amount (if any) by which the base value (see Chapter 8 at 4.2.1) of the consideration for the shares allotted exceeds the aggregate nominal value of the shares. [s611(2)-(5)].

Where group reconstruction relief is taken, and the purchase method is applied, as the cost of the business combination is based on the fair value, any amount that would otherwise have been taken to share premium account needs to be reflected in another reserve, generally a 'merger reserve' in the consolidated financial statements. Where merger accounting is applied, such an amount is not reflected in any 'merger reserve' as the mechanics of merger accounting uses the nominal value of shares issued (or the base value of the consideration).

Chapter 8 at 4.2.1 provides further detail and examples of the application of merger relief and group reconstruction relief in separate financial statements and Illustration 5-15 at 5.4.4.A above demonstrates an application of group reconstruction relief to a hive down.

5.6 Disclosure requirements

As discussed at 4 above, group reconstructions are scoped out of the 'normal' business combination disclosures required by FRS 102. Instead, FRS 102 provides that, for each group reconstruction that was effected during the period, the combined entity must disclose: [FRS 102.19.33, 6 Sch 13(1), 6 Sch 13(2)]

- (a) The names of the combining entities (other than the reporting entity)
 - (b) Whether the combination has been accounted for as an acquisition or a merger
- And

- (c) The date of combination

Additional disclosures required by the CA 2006 for a group reconstruction accounted for as a merger are:

- (a) If the transaction significantly affects the figures shown in the group accounts, the composition and fair value of the consideration given by the parent company and its subsidiary undertakings (subject to the exemption in paragraph 16 of Schedule 6 to the Regulations, as noted below). [6 Sch 13(3)].

- (b) Any adjustment to consolidated reserves as a result of setting off the nominal value of the issued share capital of the undertaking acquired held by the parent company and its subsidiary undertakings against the aggregate of:
- (i) The appropriate amount in respect of qualifying shares issued by the parent or its subsidiary undertakings (i.e., the nominal value of any shares subject to either merger or group reconstruction relief, together with the minimum premium value for shares subject to group reconstruction relief) in consideration for the acquisition of shares in the undertaking acquired.
And
 - (ii) The fair value of any other consideration given, determined as at the date of the acquisition.
[6 Sch 11(6), 6 Sch 16A(d)]
- (c) The address of the registered office of the undertaking acquired (whether in or outside the United Kingdom). [6 Sch 16A(a)]
And
- (d) The name of the ultimate controlling party that controls the undertaking whose shares are acquired and its registered office (whether in or outside the United Kingdom). [6 Sch 16A(b), 6 Sch 16A(c)].

Additional disclosures required by the CA 2006 for a group reconstruction accounted for as an acquisition are discussed at 4.3.3 above.

The requirement above regarding the fair value and composition of consideration need not be given with respect to an undertaking which:

- Is established under the law of a country outside the United Kingdom.
Or
- Carries on business outside the United Kingdom

if in the opinion of the directors of the parent company the disclosure would be seriously prejudicial to the business of that undertaking or to the business of the parent company or any of its subsidiary undertakings and the Secretary of State agrees that the information must not be disclosed. [6 Sch 16].

6 Summary of GAAP differences

The key differences between FRS 102 and IFRS in accounting for business combinations are set out below.

	FRS 102	IFRS
Method of accounting for business combinations	Purchase method used for all business combinations except certain group reconstructions and public benefit entity combinations.	Purchase method used for all business combinations. IFRS 3 excludes business combinations under common control. IFRS 3 makes no special provisions for business combinations involving public benefit entities.
Common control transactions	Merger accounting permitted for certain group reconstructions (and certain public benefit entity combinations). Merger method of accounting explained. Group reconstructions are not defined in the same way as business combinations under common control in IFRS 3 and can include some transactions that are not business combinations.	Out of scope. IFRS 3 does not specify the accounting for business combinations under common control. Such transactions can be accounted using the purchase method in IFRS 3 (if the transaction has substance) or accounted for by pooling of interests or merger accounting, if applying the GAAP hierarchy. In our view, a policy choice to apply merger accounting or the purchase method to transactions with substance must be consistently applied to similar categories of transactions.
Definitions of a business and business combination	A 'business' is an integrated set of activities and assets conducted and managed for providing a return to investors or lower costs or other economic benefits directly and proportionately to policyholders or participants. A business generally contains inputs, processes and outputs that are or will be used to generate revenues. If goodwill is present, there is a presumption that the transferred set is a business. A 'business combination' is the bringing together of separate entities or businesses into one reporting entity.	A 'business' is an integrated set of activities and assets capable of being conducted and managed (by a market participant) for providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities. A business consists of inputs and processes applied to those inputs that have the ability to contribute to the creation of outputs. A 'business combination' is a transaction or other event in which an acquirer obtains control of one or more businesses. IFRS 3 allows use of an optional test to identify concentration of fair value as a simplified assessment of whether an acquired set of activities and assets is a business. This can be elected separately for each transaction. If the concentration test is not applied or not met, a full assessment of whether there is a business is undertaken. To meet the definition of a business, an acquired set of activities and assets must include, at a minimum, an input and a substantive process that together significantly contribute to the ability to create outputs. The criteria used in the assessment differ depending on whether the acquired set has outputs or not.
Identifying the acquirer	There must be an acquirer for all business combinations using purchase method. The application guidance states, <i>inter alia</i> , that if a new entity is formed to issue equity instruments to effect a	There must be an acquirer for all business combinations within scope of IFRS 3. Paragraph B18 of IFRS 3 states, <i>inter alia</i> , that if a new entity is formed to issue equity instruments to effect a business combination, one of the pre-existing combining entities "shall be identified" as

FRS 102		IFRS
	business combination, it is likely that the acquirer is one of the pre-existing combining entities.	the acquirer by applying the guidance in paragraphs B13 to B17 of IFRS 3.
Acquisition date	Date on which the acquirer obtains control of the acquiree. Control is the power to govern the financial and operating policies of an entity or business so as to obtain benefits from its activities.	Date on which the acquirer obtains control of the acquiree. IFRS 3 refers to IFRS 10 for the meaning of 'control'. An investor controls an investee when it (1) has power over the investee, (2) is exposed, or has rights, to variable returns from its involvement with the investee and (3) has the ability to affect those returns through its power over the investee. IFRS 10 has extensive guidance on the determination of control.
Acquisition expenses	Capitalise as part of the cost of combination, so included within goodwill.	Expense.
Contingent consideration	Recognised at the amount that is probable and can be reliably measured. Subsequent adjustments (other than the unwinding of any discounting) are recognised in goodwill. No specific guidance relating to contingent consideration that may be classified as equity.	Recognised at fair value, regardless of whether payment is probable or can be measured reliably. Subsequent adjustments to profit or loss for contingent consideration classified as a financial liability. No subsequent adjustment for contingent consideration classified as equity.
Contingent payments to employees or selling shareholders and separation of transactions from the business combination	Specific requirement on separating other transactions from the exchange transaction that is the business combination (similar to IFRS 3 but with less application guidance). The cost of a transaction that remunerates employees or former owners of the acquiree for future services is not part of the cost of a business combination. However, unlike IFRS 3, new FRS 102 does not contain a requirement that contingent consideration is automatically forfeited if employment terminates is post-combination remuneration	More extensive Application Guidance. Contingent consideration forfeited if employment terminates is post-employment remuneration.
Measurement period	Provisional amounts to be finalised within twelve months after the acquisition date.	Provisional amounts to be finalised at the sooner of (i) one year from the acquisition date and (ii) when the acquirer receives the information it was seeking.

FRS 102		IFRS
Initial measurement of acquiree's assets, liabilities and contingent liabilities	Fair value (except deferred tax, employee benefits, share-based payments and leases in which the acquiree is the lessee - where FRS 102 sets out specific requirements).	Fair values (except deferred tax, employee benefits, share-based payments, assets held for sale, reacquired rights, indemnification assets, leases in which the acquiree is the lessee, and insurance contracts - where IFRS 3 sets out specific requirements). IFRS 3 also addresses the subsequent measurement of reacquired rights and indemnification assets.
Recognition of the identifiable assets and liabilities	Identifiable assets acquired and liabilities assumed are recognised only if they meet the definitions of assets and liabilities in Section 2 at the acquisition date, their fair value can be measured reliably, and they are part of the business combination rather than the result of a separate transaction. There are certain recognition exceptions. Note that Section 2 has been updated to align with the IASB's Conceptual Framework.	Identifiable assets acquired and liabilities assumed are recognised only if they meet the definitions of assets and liabilities in the <i>Conceptual Framework for Financial Reporting</i> at the acquisition date. There are certain recognition exceptions. IFRS 3 does not refer to reliable fair value measurement as a recognition criterion (except for contingent liabilities). In effect, this is assumed to be the case in a business combination.
Recognition of intangible assets separate from goodwill	Recognise at fair value if (a) meet recognition criteria (i.e., probable cash flows and fair value can be measured reliably), (b) are separable and (c) arise from contractual or legal rights. Option to recognise if meet (a) and only one of (b) or (c). This policy choice must be applied consistently to a class of intangible assets and to all business combinations.	Recognise at fair value if meet either separability or contractual - legal criterion (regardless of being separable). Probability and reliable measurement criteria always considered to be satisfied for intangible assets acquired in a business combination.
Step acquisitions	Cost of the business combination is the aggregate of the fair values of assets given, liabilities incurred or assumed and equity instruments issued at each stage of transaction plus any directly attributable costs. True and fair override may be used in certain circumstances to compute goodwill as the sum of the goodwill arising on each step. Cumulative amounts recognised in other comprehensive income are not reclassified to profit or loss.	Existing interest held immediately before control is achieved is remeasured at fair value with gain or loss recognised in profit or loss. Fair value of the existing equity interest is used in computing the cost of the combination/goodwill. Changes in value in other comprehensive income reclassified to profit or loss on the same basis as if the acquirer had disposed directly of the previously held equity interest.

FRS 102		IFRS
Non-controlling interests	Measure at proportionate share of net assets consolidated. No specific guidance for any non-controlling interests that are not entitled to a present ownership interest, the implication being they are valued at nil.	Policy choice for each business combination to use fair value or share of net assets for interests entitled to proportionate net assets share. Otherwise, fair value.
Positive goodwill	Amortised on a systematic basis over its finite useful life (cannot be indefinite). If, in exceptional circumstances, no reliable estimate of useful life can be made, the maximum life is 10 years. Test for impairment if impairment indicators.	Not amortised. Measured at cost less impairment. Mandatory annual impairment test (in addition to when there are impairment indicators).
Negative goodwill	Amount up to the fair value of non-monetary assets is recognised in periods in which non-monetary assets are recovered. Excess is amortised over periods expected to benefit.	Immediate gain in profit or loss.
Disclosures	Less onerous disclosure requirements.	Extensive disclosure requirements.

Appendix A - Defined terms

Extract from FRS 102

Appendix I

Glossary

acquisition date	The date on which the acquirer obtains control of the acquiree.
business	An integrated set of activities and assets conducted and managed for the purpose of providing: (a) a return to investors; or (b) lower costs or other economic benefits directly and proportionately to policyholders or participants. A business generally consists of inputs, processes applied to those inputs, and resulting outputs that are, or will be, used to generate revenues. If goodwill is present in a transferred set of activities and assets, the transferred set shall be presumed to be a business.
business combination	The bringing together of separate entities or businesses into one reporting entity.
combination that is in substance a gift	A combination carried out at nil or nominal consideration that is not a fair value exchange but in substance the gift of one entity to another.
goodwill	Future economic benefits arising from assets that are not capable of being individually identified and separately recognised.
group reconstruction	Any one of the following arrangements: (a) the transfer of an equity holding in a subsidiary from one group entity to another; (b) the addition of a new parent entity to a group; (c) the transfer of equity holdings in one or more subsidiaries of a group to a new entity that is not a group entity but whose equity holders are the same as those of the group's parent; (d) the combination into a group of two or more entities that before the combination had the same equity holders; (e) the transfer of the business of one group entity to another; or (f) the transfer of the business of one group entity to a new entity that is not a group entity but those equity holders are the same as those of the group's parent.
merger	An entity combination that results in the creation of a new reporting entity formed from the combining parties, in which the controlling parties of the combining entities come together in a partnership for the mutual sharing of risks and benefits of the newly formed entity and in which no party to the combination in substance obtains control over any other, or is otherwise seen to be dominant. All of the following criteria must be met for an entity combination to meet the definition of a merger: (a) no party to the combination is portrayed as either acquirer or acquiree, either by its own board or management or by that of another party to the combination; (b) there is no significant change to the classes of beneficiaries of the combining entities or the purpose of the benefits provided as a result of the combination; and (c) all parties to the combination, as represented by the members of the board, participate in establishing the management structure of the combined entity and in selecting the management personnel, and such decisions are made on the basis of a consensus between the parties to the combination rather than purely by exercise of voting rights.

Public benefit entity

An entity whose primary objective is to provide goods or services for the general public, community or social benefit and where any equity is provided with a view to supporting the entity's primary objectives rather than with a view to providing a financial return to equity providers, shareholders or members.¹⁰⁶

¹⁰⁶ The term 'public benefit entity' does not necessarily imply that the purpose of the entity is for the benefit of the public as a whole. For example, many PBEs exist for the direct benefit of a particular group of people, although it is possible that society as a whole also benefits indirectly. The important factor is what the primary purpose of such an entity is, and that it does not exist primarily to provide economic benefit to its investors. Organisations such as mutual insurance companies, other mutual co-operative entities and clubs that provide dividends or other economic benefits directly and proportionately to their owners, members or participants are not PBEs.

Some PBEs undertake certain activities that are intended to make a surplus in order to fund their primary activities. Consideration should be given to the primary purpose of an entity's (or group's) activities in assessing whether it meets the definition of a PBE.

PBEs may have received contributions in the form of equity, even though the entity does not have a primary profit motive. However, because of the fundamental nature of public benefit entities, any such contributions are made by the equity holders of the entity primarily to enable the provision of goods or services to beneficiaries rather than with a view to a financial return for themselves. This is different from the position of lenders; loans do not fall into the category of equity.

Chapter 23

Leases

Contents

Overview	962
1 Introduction	963
2 Comparison between Section 20 and IFRS	964
2.1 Scope - Leases with non-typical contractual terms	964
2.2 Lessee accounting - Discount rate on initial recognition	964
2.3 Lessee accounting - Leases that provide a lessee with incoming resources arising from a government grant or non-exchange transaction	964
2.4 Lessee accounting - Discount rate on modifications	965
2.5 Lessee accounting - Leases of low value assets	965
2.6 Lessor accounting - Straight-line basis for lease payments	965
2.7 Sale and leaseback	966
2.8 Disclosure	966
3 Requirements of Section 20 for leases: Objective and scope of Section 20	968
3.1 Objective and scope of Section 20	968
3.1.1 Leases with non-typical contractual terms classified as financial instruments	968
3.2 Recognition exemptions	969
4 Requirements of Section 20 for leases: What is a lease?	970
4.1 Determining whether an arrangement contains a lease	970
4.1.1 Joint ventures	970
4.1.1.A Jointly controlled entity enters into the contract	971
4.1.1.B Parties to jointly controlled operation collectively enter into the contract	971
4.1.1.C Lead venturer enters into the contract	972
4.1.2 Identified asset	972
4.1.3 Substantive substitution rights	975
4.1.4 Right to obtain substantially all of the economic benefits from use of the identified asset	977
4.1.5 Right to direct the use of the identified asset	977
4.1.5.A The right to direct how and for what purpose an asset is used throughout the period of use	978
4.1.5.B The relevant decisions about how and for what purpose an asset is used are predetermined	978
4.1.5.C Specifying the output of an asset before the period of use	979
4.1.5.D Protective rights	980
4.1.6 Flowchart	980
4.1.7 Reassessment of the contract	981

4.1.8	Intra-group arrangements	981
4.2	Identifying and separating lease and non-lease components of a contract and allocating contract consideration	982
4.2.1	Identifying and separating lease components of a contract	982
4.2.2	Identifying and separating lease from non-lease components of a contract	983
4.2.2.A	Payments that do not transfer a good or service to the lessee	983
4.2.2.B	Practical expedient - lessees	984
4.2.3	Determining and allocating the consideration in the contract - lessees	985
4.2.3.A	Determining the consideration in the contract	985
4.2.3.B	Allocating the consideration in the contract - lessees	985
4.2.4	Determining and allocating the consideration in the contract - lessors	986
4.2.4.A	Determining the consideration in the contract - lessors	986
4.2.4.B	Allocating the consideration in the contract - lessors	986
4.2.5	Examples - Identifying and separating components of a contract and determining and allocating the consideration in the contract	986
4.3	Contract combinations	988
5	Requirements of Section 20 for leases: Key concepts	989
5.1	Inception of a contract	989
5.2	Commencement date of the lease	989
5.3	Lessee involvement with the underlying asset before the commencement date	989
5.4	Lease term and purchase options	990
5.4.1	Lease term	990
5.4.1.A	Evaluating lease term and purchase options	990
5.4.1.B	Cancellable leases	992
5.4.2	Reassessment of the lease term and purchase options	993
5.4.2.A	Reassessment of the lease term and purchase options- lessees	993
5.4.2.B	Reassessment of the lease term and purchase options - lessors	994
5.5	Lease payments	994
5.5.1	In-substance fixed lease payments	995
5.5.2	Lease incentives	995
5.5.3	Variable lease payments that depend on an index or rate	996
5.5.4	The exercise price of a purchase option	997
5.5.5	Payments for penalties for terminating a lease	997
5.5.6	Amounts expected to be payable under residual value guarantees - lessees only	997
5.5.7	Residual value guarantees - lessors only	998
5.5.8	Variable lease payments that do not depend on an index or rate	998
5.5.9	Security deposits	998
5.5.10	Non-recoverable value added tax (VAT) and property taxes	1000
5.5.11	Co-tenancy clauses	1002
5.5.12	Reassessment of the lease liability	1002
5.6	Discount rates	1002
5.6.1	Determination of the incremental or obtainable borrowing rate by a subsidiary with centralised treasury functions	1005
5.6.2	Reassessment of the discount rate	1005
5.6.3	Public benefit entities - additional simplification	1005
5.7	Initial direct costs	1005

5.7.1	Lessor accounting for initial direct costs	1006
5.7.2	Lessee accounting for initial direct costs	1006
5.8	Economic life	1006
5.9	Fair value	1006
6	Requirements of Section 20 for leases: Lessee accounting	1007
6.1	Initial recognition	1007
6.1.1	Short-term leases	1007
6.1.2	Leases of low-value assets	1008
6.2	Initial measurement	1009
6.2.1	Right-of-use assets	1009
6.2.2	Lease liabilities	1009
6.3	Subsequent measurement	1011

9	Requirements of Section 20 for sale and leaseback transactions	1043
9.1	Determining whether the transfer of an asset is a sale	1043
9.2	Transactions in which the transfer of an asset is a sale	1045
9.2.1	Accounting for the sale	1045
9.2.1.A	Accounting for the sale - policy of measuring the right-of-use asset at the proportion of the previous carrying amount that relates to the right of use retained	1046
9.2.1.B	Accounting for the sale - policy of measuring the right-of-use asset in accordance with FRS 102.20.46	1048
9.2.2	Accounting for the leaseback	1048
9.2.3	Adjustment for off-market terms	1048
9.2.4	Illustrative Examples	1048
9.3	Transactions in which the transfer of an asset is not a sale	1053
9.4	Disclosure	1053
10	Requirements of Section 20 for leases: Business combinations	1054
10.1	Acquiree in a business combination is a lessee	1054
10.1.1	Initial measurement of a lease	1054
10.1.2	Subsequent measurement of a lease	1054
10.2	Acquiree in a business combination is a lessor	1054
11	Requirements of Section 20 for leases: Periodic review 2024 Transitional Arrangements	1055
11.1	Transition to the revised Section 20	1055
11.1.1	Practical expedient: Definition of a lease on transition to the revised Section 20	1055
11.1.2	Disclosure requirements on transition to the revised Section 20	1055
11.2	Lessee transition	1055
11.2.1	IFRS 16 option	1056
11.2.1.A	Government grant or non-exchange transaction on initial application	1056
11.2.2	Leases previously classified as operating leases	1059
11.2.3	Leases previously classified as finance leases	1060
11.3	Lessor transition	1060
11.3.1	Subleases	1061
11.4	Sale and leaseback transactions	1061

12 Summary of differences between Section 20 and IFRS	1062
Appendix A - Defined terms	1065
Appendix B - Index of Illustrations	1068

Overview

This chapter discusses the requirements of Section 20 *Leases* and how the section is to be applied. Section 20 prescribes the accounting requirements for the recognition, measurement, presentation and disclosure of leases and applies to both lessees and lessors. It has a single lessee accounting model and requires lessees to recognise assets and liabilities for most leases on their statements of financial position. Lessors, however, classify leases as operating or finance leases depending on whether the risks and rewards incidental to ownership of the underlying asset are transferred to the customer and account for the lease accordingly.

Under Section 20, leases are accounted for based on a 'right-of-use model'. The model reflects that, at the commencement date, a lessee has a financial obligation to make lease payments to the lessor for its right to use the underlying asset during the lease term. The lessor conveys that right to use the underlying asset at lease commencement, which is the date when it makes the underlying asset available for use by the lessee.

What you need to know

- Section 20 requires lessees to recognise most leases on their statements of financial position.
- Lessees apply a single accounting model for all leases, with certain exemptions.
- Lessors classify leases as operating or finance leases depending on whether the risks and rewards incidental to ownership of the underlying asset are transferred to the lessee and account for the lease accordingly.
- Entities need to focus on whether an arrangement contains a lease or a service agreement because there are significant differences in the accounting. Although we believe that the assessment of whether a contract contains a lease is straightforward in most arrangements, judgement may be required in applying the definition of a lease to certain arrangements, particularly those that include significant services.

1 Introduction

The requirements of Section 20 set out in this chapter reflect changes arising from the Periodic Review 2024 amendments to FRS 102 and are applicable for reporting periods beginning on or after 1 January 2026. Prior to these amendments, Section 20 followed the precedent of previous UK and international accounting standards such as SSAP 21 *Accounting for Leases and Hire Purchase Contracts* and IAS 17 *Leases*. The amendments introduce significant changes to lease accounting under UK GAAP, aligning the requirements more closely to those set out under IFRS 16 *Leases*, which replaced IAS 17 for IFRS reporting entities for financial periods beginning on or after 1 January 2019.

Due to the similarities between Section 20 and IFRS 16, which contains extensive guidance, we draw on that guidance as part of the explanation in this chapter, applying the hierarchy on selecting accounting policies as set out in Section 10 *Accounting Policies, Estimates and Errors* (refer to Chapter 9 at 3.1).

2 Comparison between Section 20 and IFRS

As set out at 1 above, following the Periodic Review 2024, Section 20 has been aligned closely to IFRS 16. However, Section 20 contains less extensive guidance than IFRS 16 and also includes certain simplifications. The key differences between Section 20 and IFRS 16 are discussed at 2.1 to 2.8 below. The table at 12 below contains a more extensive summary of the GAAP differences.

2.1 Scope - Leases with non-typical contractual terms

The scope of Section 20 is similar to the scope of IFRS 16 with one exception.

Certain leases are excluded from the scope of Section 20 and instead classified as financial instruments within scope of Section 12 *Other Financial Instruments Issues* if the lease could, as a result of non-typical contractual terms, result in a loss to the lessor or the lessee. [FRS 102.20.1(f)]. No similar scope exclusion exists in IFRS 16, and therefore certain leases with non-typical contractual terms may be accounted for as leases under IFRS 16, but financial instruments under FRS 102. However, the Basis for Conclusions to FRS 102 notes that in practice not many leases are expected to fall within the scope of Section 12. [FRS 102.B20.2]. Refer to 3.1.1 below.

2.2 Lessee accounting - Discount rate on initial recognition

Under IFRS 16, for lessees, lease payments are discounted using the interest rate implicit in the lease if that rate can be readily determined. If that rate cannot be readily determined, the lessee uses the incremental borrowing rate. [IFRS 16.26].

Under FRS 102, for lessees, consistent with IFRS 16, lease payments are discounted using the interest rate implicit in the lease if that rate can be readily determined. However, if that rate cannot be readily determined, Section 20 offers lessees a choice (which can be made on a lease-by-lease basis), to use either the lessee's incremental borrowing rate or the lessee's obtainable borrowing rate. [FRS 102.20.49]. The term 'lessee's obtainable borrowing rate' is unique to FRS 102. The concept is similar to that of the incremental borrowing rate but is expected to be simpler to determine, and therefore it was introduced into FRS 102 by the Financial Reporting Council ('FRC') as a proportionate simplification. [FRS 102.B20.12(a)]. See 5.6 below.

FRS 102 also offers a further simplification for public benefit entities. A public benefit entity that is unable readily to determine any of the three rates (interest rate implicit in the lease, incremental borrowing rate or obtainable borrowing rate), instead uses the rate of interest it can otherwise obtain on deposits held with financial institutions. [FRS 102.PBE20.50]. Refer to 5.6 below.

2.3 Lessee accounting - Leases that provide a lessee with incoming resources arising from a government grant or non-exchange transaction

A lessor may provide a lessee with incoming resources from a government grant or, for a public benefit entity, a non-exchange transaction. This may be the case if, for example, a lease is provided by a government body, and the lease payments are significantly below market rents.

IFRS 16 does not contain any specific guidance on the accounting for such transactions.

FRS 102 states that at the commencement date, or in the event of a modification that is not accounted for as a separate lease, a lessee uses the information readily available to it to determine whether it is in receipt of such incoming resources. If so, the lessee recognises those incoming resources as part of the cost of the right-of-use asset. The incoming resources must be recognised and measured in accordance with, as applicable, Section 24 *Government Grants* or (for a public benefit entity only) paragraphs PBE34.64 to PBE34.74 *Incoming Resources from Non-Exchange Transactions* of Section 34 *Specialised Activities*. FRS 102 goes on to state that if the contractual payments are so low that they are not substantive (e.g., peppercorn or nominal consideration), the arrangement may not meet the definition of a lease.

[FRS 102.20.35]. In such cases, the requirements of Section 34 regarding incoming resources from non-exchange transactions applies to the public benefit entity as for other donations. [FRS 102.B20.B14].

Refer to 6.2.1 below.

2.4 Lessee accounting – Discount rate on modifications

A lease modification is a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions. [FRS 102 Appendix I, IFRS 16 Appendix A]. Examples include adding or terminating the right to use one or more underlying assets, or extending or shortening the contractual lease term. Section 20 and IFRS 16 contain broadly similar requirements on the accounting for lease modifications, but Section 20 includes a simplification with regards to the discount rate to apply in certain circumstances.

IFRS 16 requires lessees to use a revised discount rate for all lease modifications which are not accounted for as separate leases. [IFRS 16.45(c)].

In general, when applying Section 20 to a lease modification that is not accounted for as a separate lease, the lessee is required to remeasure the lease liability using a revised discount rate. However, Section 20 allows the use of an unchanged discount rate when any of the following conditions are met:

- The additional consideration from the lease modification is insignificant to the total consideration of the original lease.
- The lease modification decreases the scope of the lease by removing the right to use one or more underlying assets, and the consideration for the lease decreases by an amount commensurate with the stand-alone price for the decrease in scope.

Or

- The lease modification decreases the consideration payable for the remaining term of the lease, but does not decrease the scope of the lease by removing the right to use one or more underlying assets. [FRS 102.20.72].

Refer to 6.5.2 below.

2.5 Lessee accounting – Leases of low value assets

Both Section 20 and IFRS 16 provide a recognition exemption accounting policy choice for lessees in respect of leases for which the underlying asset is of 'low value'. A lessee that makes this election does not recognise a lease liability or right-of-use asset on its statement of financial position. Instead, the lessee recognises the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis, if that basis is more representative of the pattern of the lessee's benefit. [FRS 102.20.6, IFRS 16.6]. This election can be made on a lease-by-lease basis. [FRS 102.20.7, IFRS 16.7].

Under both Section 20 and IFRS 16, the assessment of whether an underlying asset is of low value is performed on an absolute basis (meaning the assessment is not affected by the size, nature or circumstances of the lessee). However, there are differences between Section 20 and IFRS 16 on how low value assets are identified. Neither provides a quantitative threshold for defining low value assets, but IFRS 16 provides examples of low value assets, stating that examples "...can include tablet and personal computers, small items of office furniture and telephones". [IFRS 16.B8]. The Basis for Conclusions to IFRS 16 also explains that the IASB had in mind leases of underlying assets with a value, when new, "...in the order of magnitude of \$5,000 or less". [IFRS 16.BC100]. In contrast, Section 20 highlights examples of assets which are not of low value, such as vehicles, land and buildings and production line equipment. No list of examples of low-value assets is provided. The Basis for Conclusions to FRS 102 indicates that the FRC intended this to offer FRS 102 reporters greater flexibility in defining low-value assets. As a result, FRS 102 preparers may be able to apply the on-balance sheet lease accounting model to a smaller proportion of their leases when compared with entities applying IFRS 16. [FRS 102.B20.10, FRS 102.B20.11].

Refer to 6.1.2 below.

2.6 Lessor accounting – Straight-line basis for lease payments

IFRS 16 requires all operating lease payments to be recognised as income on a straight-line basis, unless another systematic basis is more representative of the pattern in which benefit from use of the underlying asset is diminished. [IFRS 16.81].

FRS 102 contains this same requirement with one exception: if lease payments increase annually by fixed increments intended to compensate for expected annual inflation over the lease period, the fixed minimum increment that reflects expected general inflation will be recognised as an income as incurred.

[FRS 102.20.106 (b)].

Refer to 7.4 below.

2.7 Sale and leaseback

Under IFRS 16, when an entity enters into a sale and leaseback transaction and the transfer of the asset from the seller-lessee to the buyer-lessor qualifies as a sale in accordance with the requirements of IFRS 15 *Revenue from Contracts with Customers*, the seller-lessee is required to measure the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee recognises only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor. [IFRS 16.100(a)].

Under Section 20, where an entity enters into a sale and leaseback transaction and the transfer of the asset qualifies as a sale in accordance with Section 23 *Revenue from Contracts with Customers*, entities have an accounting policy choice in respect of the measurement of the right-of-use asset and the treatment of any gain. The policy choice available (to be applied consistently) is to either:

- Measure the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee recognise only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor (a policy aligned to the required approach under IFRS 16).
- Or
- Measure the right-of-use asset arising from the leaseback in accordance with the requirements for initial measurement of the right-of-use asset on lease commencement explained in paragraph 20.46, with any excess of the sale proceeds over the previous carrying amount of the asset deferred, and amortised over the lease term, and any shortfall of the sales proceeds under the carrying amount recognised immediately in profit or loss. [FRS 102.20.123(a)]. This option is not available in IFRS 16.

Refer to 9.2 below.

2.8 Disclosure

Section 20 contains similar detailed disclosure requirements to IFRS 16, with some differences for both lessees and lessors.

For lessees:

- IFRS 16 requires a lessee to disclose information about its leases in a single note or separate section in its financial statements, although information can be incorporated by cross-reference. [IFRS 16.52]. In addition, IFRS 16 requires certain disclosures to be provided in a tabular format (unless another format is more appropriate). [IFRS 16.54]. Section 20 does not include equivalent requirements.
- IFRS 16 requires lease commitment disclosures for short-term leases accounted for using the recognition exemption in paragraph 6 of IFRS 16 to be disclosed, if the portfolio of short-term leases to which it is committed at the end of the reporting period is dissimilar to the portfolio of short-term leases to which the short-term lease expense for the year disclosed in accordance with paragraph 53(c) of IFRS 16 relates. [IFRS 16.55]. Section 20 requires a lessee to disclose separately lease commitments for short-term leases and leases of low-value assets at the end of the reporting period, for each of (a) periods not later than one year; (b) periods later than one year and not later than five years; and (c) periods later than five years. [FRS 102.20.82].
- IFRS 16 requires lessees to disclose a maturity analysis of lease liabilities applying paragraphs 39 and B11 of IFRS 7 *Financial Instruments: Disclosures* separately from the maturity analysis of other financial liabilities. [IFRS 16.58]. Section 20 does not require lessees to disclose a maturity analysis of lease liabilities. However, the Regulations require some disclosures for the aggregate of all items shown under 'creditors' in an entity's balance sheet.

Disclosure requirements for lessees are discussed at 6.8 below.

For lessors:

- IFRS 16 requires certain disclosures by lessors to be provided in a tabular format (unless another format is more appropriate). [IFRS 16.91]. Section 20 does not include an equivalent requirement.
- IFRS 16 requires a lessor to disclose how it manages the risk associated with any rights it retains in underlying assets. In particular, a lessor discloses its risk management strategy for the rights it retains in underlying assets, including any means by which the lessor reduces that risk. [IFRS 16.92(b)]. Section 20 requires entities (lessees and lessors) to disclose additional qualitative information where necessary to understand the entity's significant leasing arrangements, [FRS 102.20.115], but contains no specific requirement for a lessor to disclose how it manages the risk associated with any rights it retains in underlying assets.

Disclosure requirements for lessors are discussed at 7.8 below.

In addition to the disclosure differences for lessees and lessors set out above, disclosure differences will also arise where an entity makes use of optional simplifications that are permitted by Section 20, or as a result of other differences between FRS 102 and IFRS. For example:

- An entity that has applied either or both of the practical expedients in paragraph 13 of Section 20 (relating to portfolio application – refer to 6.6.3 and 7.6.2 below) or paragraph 33 of Section 20 (relating to non-lease components – refer to 4.2.2.B below), must disclose that fact. *[FRS 102.20.78]*.
- In a sale and leaseback transaction where the transfer of the asset is a sale, a seller-lessee that has elected to measure the right-of-use asset arising from the leaseback in accordance with paragraph 46 of Section 20 is required to disclose that fact. *[FRS 102.20.77(v)]*. (Refer to 9.2 below).
- A lessee that has used an unchanged discount rate in accordance with paragraph 72 of Section 20 to remeasure a lease liability on lease modification (refer to 6.5.2 below) must disclose that fact, and the carrying amount at the end of the reporting period of lease liabilities which have been remeasured in that manner. *[FRS 102.20.79]*.
- For right-of-use assets meeting the definition of heritage assets (refer to Chapter 36 at 5.2.4), a lessee must apply the disclosure requirements in paragraphs 55 to 56 of Section 34 and is not required to provide the disclosures required by paragraphs 20.80(e) and 20.81 for those right-of-use assets. *[FRS 102.20.84]*.

3 Requirements of Section 20 for leases: Objective and scope of Section 20

3.1 Objective and scope of Section 20

Section 20 sets out the principles for the recognition, measurement, presentation, and disclosure of leases. Section 20 paragraph 1 applies to all leases, including leases of right-of-use assets in a sublease, except for the following:

- (a) Leases to explore for, or use, minerals, oil, natural gas and similar non-regenerative resources
- (b) Leases of biological assets within the scope of Section 34 held by a lessee (refer to Chapter 36 at 2.4)
- (c) Service concession arrangements within the scope of Section 34 (refer to Chapter 36 at 4). Entities should evaluate the applicability of Section 34 before evaluating whether an arrangement contains a lease
- (d) Licences of intellectual property granted by a lessor within the scope of Section 23 (refer to Chapter 25 at 9)
- (e) Rights held by a lessee under licensing agreements within the scope of Section 18 *Intangible Assets other than Goodwill* for such items as motion picture films, video recordings, plays, manuscripts, patents and copyrights (refer to Chapter 21)
- (f) Leases that could lead to a loss to the lessor or the lessee as a result of non-typical contractual terms (refer to 3.1.1 below) [FRS 102.20.1]

A lessee may, but is not required to, apply Section 20 to leases of intangible assets not covered by the exception in (e) above. [FRS 102.20.2]. Therefore, a lessee could choose to account for leases of such intangible assets under Section 20 (refer to Chapter 21).

IFRS 16 contains a scope exclusion similar to (e) above, and for IFRS reporting entities there are differing views about whether other intangible assets (for example, a licence of software), not specifically referred to in IFRS 16.3(e), are excluded from the scope of IFRS 16 based on interpretations of that paragraph. Given the consistency between IFRS 16.3(e) and FRS 102.20.1(e), similar diversity of views may arise for entities applying FRS 102. If an entity determines that an intangible asset is not excluded from the scope of Section 20, paragraph 2 of Section 20 permits, but does not require, an entity to account for the intangible asset as a lease. [FRS 102.20.2].

If a cloud computing arrangement contains a lease of an asset other than a licence of software (or the entity has determined that a licence of software is not excluded from the scope of Section 20 and has elected to account for leases of intangible assets under Section 20), an entity should apply the provisions of Section 20 to the cloud computing arrangement. This includes identifying and separating lease and non-lease components and allocating contract consideration, which is discussed in section 4.2 below.

Entities are required to apply paragraphs 34.49 to 34.56 of FRS 102 to account for heritage asset held under a lease. [FRS 102.20.3]. (Refer to Chapter 36 at 5).

3.1.1 Leases with non-typical contractual terms classified as financial instruments

Certain leases are not accounted for as leases in accordance with Section 20 but instead classified as financial instruments within scope of Section 12 if the lease could, as a result of non-typical contractual terms, result in a loss to the lessor or the lessee. The Basis for Conclusions to FRS 102 states that this could include contractual terms that are unrelated to changes in the price of the leased asset, changes in foreign exchange rates, or a default by one of the counterparties. [FRS 102.BC.B20.1]. The Basis for Conclusions also notes that "...the reference to 'changes in the price of the leased asset' is framed widely and in practice not many leases are expected to fall within the scope of Section 12." Section 12 is addressed in Chapters 11 to 15 [FRS 102.BC.B20.2].

Although it is not clear precisely what contractual terms are referred to, it is likely that this does not refer to rents that vary according to:

- Non-financial variables specific to the parties to the contract, e.g., rents that vary with future sales or amount of future use.
- Or
- Future price indices and future market rates of interest that are relevant to the parties to the contract.

Accounting for these variable lease payments is addressed by Section 20 (refer to 5.5.3 and 5.5.8 below). In summary variable lease payments that depend on an index or rate are included in the measurement of the lease liability (refer to 5.5.3 below) and variable lease payments that do not depend on an index or rate (e.g., percentage of revenue) are recognised in profit or loss in the period in which the event or condition that triggers those payments occurs (refer to 5.5.8 below).

3.2 Recognition exemptions

Section 20 allows a lessee to elect not to apply the recognition requirements to:

- Short-term leases.
And
- Leases for which the underlying asset is of low value. [*FRS 102.20.5*].

These recognition exemptions are discussed further in 6.1.1 and 6.1.2 below.

4 Requirements of Section 20 for leases: What is a lease?

Section 20 defines a lease as a contract, or part of a contract, which conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration. [FRS 102 Appendix I]. The determination of whether an arrangement contains a lease is performed at the inception of the contract. [FRS 102.20.15].

The assessment of whether a contract is or contains a lease will be straightforward in most arrangements. However, judgement may be required in applying the definition of a lease to certain arrangements. For example, in contracts that include significant services, determining whether the contract conveys the right to direct the use of an identified asset may be challenging. We discuss this further below.

4.1 Determining whether an arrangement contains a lease

Extract from FRS 102

Appendix I

Glossary

Lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.
period of use	The total period of time that an asset is used to fulfil a contract with a customer (including any non-consecutive periods of time).
contract	An agreement between two or more parties that creates enforceable rights and obligations.

At inception of a contract, an entity assesses whether the contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. [FRS 102.20.15]. Refer to 4.1.2 and 4.1.3 below for additional discussion on identified assets.

A period of time may be described in terms of the amount of use of an identified asset (for example, the number of production units that an item of equipment will be used to produce). [FRS 102.20.26].

To assess whether a contract conveys the right to control the use of an identified asset for a period of time, an entity assesses whether, throughout the period of use, the customer has both of the following:

- The right to direct the use of the identified asset (refer to 4.1.5 below).
- And
- The right to obtain substantially all of the economic benefits from use of the identified asset (refer to 4.1.4 below). [FRS 102.20.16].

If the customer has the right to control the use of an identified asset for only a portion of the term of the contract, the contract contains a lease for that portion of the term. [FRS 102.20.16].

An entity assesses whether a contract contains a lease for each potential separate lease component. [FRS 102.20.17]. Refer to 4.2.1 below.

4.1.1 Joint ventures

Entities often enter into joint ventures with other entities for certain activities (e.g., exploration of oil and gas fields, development of pharmaceutical products). Lease contracts may be entered into for the use of an asset by a joint venture, and where this is the case, it is necessary for the parties to the joint venture to consider whether those arrangements meet the definition of the lease, and if so, how each party should account for their interest in the lease.

Under Section 15 *Investments in Joint Ventures*, joint ventures can take one of three forms: jointly controlled operations ('JCO'); jointly controlled assets ('JCA'); and jointly controlled entities ('JCE'). Section 15 defines a jointly controlled entity as a joint venture "...that involves the establishment of a corporation, partnership or other entity in which each venturer has an interest." [FRS 102.15.8]. Jointly controlled operations arise when a joint venture is established that does not involve the formation of a separate corporation, partnership or other entity or financial structure that exists separately from the venturers. 'Venturers' is the term used under Section 15 to mean "A party to a joint venture that has joint control over that joint venture". [FRS 102 Appendix I]. In some cases, there may be a lead venturer and other venturers. In addition to 'venturers', there may well be other investors in the joint venture.

A contract to receive goods or services may be entered into by a joint venture or on behalf of a joint venture. Unlike IFRS 16, Section 20 does not explicitly state that in such a case the joint venture is considered to be the customer in the contract, but assuming this reflects the substance of the arrangement, we would expect a similar conclusion to be reached under FRS 102. Accordingly, in determining whether such a contract contains a lease, an assessment needs to be made as to which party (e.g., the joint venture or the lead venturer) has the right to control the use of an identified asset throughout the period of use.

If the parties to a joint venture collectively have the right to control the use of an identified asset throughout the period of use as a result of their collective control of the operation, the joint venture is the customer to the contract that may contain a lease. It would be inappropriate to conclude that the contract does not contain a lease on the grounds that each of the parties to the joint venture either has rights to a non-physically distinct portion of an underlying asset and, therefore, does not have the right to substantially all of the economic benefits from the use of that underlying asset or does not unilaterally direct its use. Determining if the parties to the joint venture collectively have the right to control the use of an identified asset throughout the period of use would require a careful analysis of the rights and obligations of each party.

A contract for the use of an asset in a joint venture might be entered into in a number of different ways, including:

- Directly by the joint venture, if the joint venture has its own legal identity.
- By each of the parties to the joint venture individually signing the same arrangement.
- By one or more of the parties to the joint venture on behalf of the joint venture. Generally, this would be evidenced in the contract and the parties to the joint venture would have similar rights and obligations as they would if they individually signed the arrangement. In these situations, the facts and circumstances, as well as the legal position of each entity, need to be evaluated carefully.
- By the lead venturer of the joint venture in its own name, i.e., as principal. This may occur when the lead venturer leases equipment which it then uses in fulfilling its obligations as the lead venturer of the joint venture and/or across a range of unrelated activities, including other joint ventures with unrelated activities, such as with other joint operating parties.

4.1.1.A Jointly controlled entity enters into the contract

Based on the definitions in Section 15, the joint venture in the first scenario at 4.1.1 above would typically be a jointly controlled entity, as it has its own legal identity. Where a jointly controlled entity enters into a contract directly on its own behalf, the venturers would not account for the contract (or their share of the contract) in their own financial statements. Instead, the accounting for that contract would be included in the financial statements of jointly controlled entity itself, with the venturers then accounting for their interest in the jointly controlled entity in accordance with Section 15.

4.1.1.B Parties to jointly controlled operation collectively enter into the contract

In some instances, the venturers who are party to a jointly controlled operation may enter into a contract for the use of an identified asset on behalf of the joint operation. The second and third scenarios at 4.1.1 above may be examples of this. In such cases, if it has been determined that a contract is, or contains, a lease, each of the venturers will account for their respective interests in the joint venture (including any leases) under paragraphs 15.4 to 15.7 of FRS 102. Therefore, they will account for their individual share of any right-of-use assets and lease liabilities, and associated depreciation and interest.

As discussed at 4.1.1.C below, in some cases a contract may be entered into by the lead venturer in its own name, and the lead venturer may determine that it is the lessee in that contract. However, the lead venturer may then enter into an arrangement with one of its joint ventures, whereby it yields control of the right to use the asset to the joint venture for a period of time. In such cases, the lead venturer needs to evaluate whether it has entered into a sublease with the joint venture. The conclusion as to whether the joint venture is a customer, i.e., the lessee in a contract with a lead venturer would depend on the individual facts and circumstances.

If it is determined that the lead venturer has subleased an asset to a jointly controlled operation, Section 15 requires the other venturers to recognise their respective share of the joint arrangement's right-of-use asset and lease liability, and the lead venturer accounts for its sublease to the joint arrangement separately. However, if there is no sublease, the other venturers recognise expenses when incurred for their share of the costs incurred by the lead venturer in respect of the leased asset.

4.1.1.C Lead venturer enters into the contract

In the fourth scenario at 4.1.1 above (i.e., where the lead venturer enters the arrangement in its own name), the lead venturer will need to assess whether the arrangement is, or contains, a lease. If the lead venturer controls the use of the identified asset, it would recognise the entire right-of-use asset and lease liability on its statement of financial position. This is on the basis that in respect of its interests in jointly controlled operations, a venturer recognises the assets that it controls and the liabilities that it incurs in its financial statements. Identifying the liabilities that a venturer incurs and those incurred jointly requires an assessment of the terms and conditions in all contractual arrangements that relate to the jointly controlled operation, and would include consideration of the laws pertaining to those agreements. As the sole signatory to the lease agreement, we would therefore expect the lead operator to recognise 100% of the lease liability. This would be the case even if it is entitled to invoice the other parties their proportionate share of the costs under the joint operating agreement (JOA).

If the lead venturer determines that it is the lessee, it would also evaluate whether it has entered into a sublease with the joint venture.

4.1.2 Identified asset

An arrangement only contains a lease if there is an identified asset.

An asset is typically identified by being explicitly specified in a contract. For example, the contract may specify a building by its address or a car by its registration number. However, an asset can also be identified by being implicitly specified at the time that the asset is made available for use by the customer.

[FRS 102.20.19].

Illustration 4-1: Implicitly specified asset

Customer X enters into a five-year contract with Supplier Y for the use of rolling stock specifically designed for Customer X. The rolling stock is designed to transport materials used in Customer X's production process and is not suitable for use by other customers. The rolling stock is not explicitly specified in the contract, but Supplier Y owns only one rolling stock that is suitable for Customer X's use. If the rolling stock does not operate properly, the contract requires Supplier Y to repair or replace the rolling stock. Assume that Supplier Y does not have a substantive substitution right. Refer to 4.1.3 below.

Analysis: The rolling stock is an identified asset. While the rolling stock is not explicitly specified in the contract (e.g., by serial number), it is implicitly specified because Supplier Y must use it to fulfil the contract.

Illustration 4-2: Identified asset - implicitly specified at the time the asset is made available for use by the customer

Customer X enters into a five-year contract with Supplier Y for the use of a car. The specification of the car is specified in the contract (brand, type, colour, options etc.). At inception of the contract the car is not yet built.

Analysis: The car is an identified asset. Although the car cannot be identified at inception of the contract, it is apparent that it will be identifiable at the commencement of the lease. The car is identified by being implicitly specified at the time that it is made available for use by the customer (i.e., at the commencement date).

A capacity portion of an asset is an identified asset if it is physically distinct (e.g., a floor of a building). A capacity or other portion of an asset that is not physically distinct (e.g., a capacity portion of a fibre optic cable) is not an identified asset unless it represents substantially all of the capacity of the asset and thereby provides the customer with the right to obtain substantially all of the economic benefits from use of the asset. [FRS 102.20.22].

Some contracts allow the use of an identified asset for specified, non-consecutive periods. This is discussed further at 5.4.1.A below.

Illustration 4-3: Identified asset - physically distinct portion of a larger asset

Customer X enters into a 12-year contract with Supplier Y for the right to use three fibres within a fibre optic cable between New York and London. The contract identifies three of the cable's 20 fibres for use by Customer X. The three fibres are dedicated solely to Customer X's data for the duration of the contract term. Assume that Supplier Y does not have a substantive substitution right (refer to 4.1.3 below).

Analysis: The three fibres are identified assets because they are physically distinct and explicitly specified in the contract.

Illustration 4-4: Identified asset - capacity portion of an asset**Scenario A**

Customer X enters into a five-year contract with Supplier Y for the right to transport oil from Country A to Country B through Supplier Y's pipeline. The contract provides that Customer X will have the right to use of 95% of the pipeline's capacity throughout the term of the arrangement.

Analysis: The capacity portion of the pipeline is an identified asset. While 95% of the pipeline's capacity is not physically distinct from the remaining capacity of the pipeline, it represents substantially all of the capacity of the entire pipeline and thereby provides Customer X with the right to obtain substantially all of the economic benefits from use of the pipeline.

Scenario B

Assume the same facts as in Scenario A, except that Customer X has the right to use 60% of the pipeline's capacity throughout the term of the arrangement.

Analysis: The capacity portion of the pipeline is not an identified asset because 60% of the pipeline's capacity is less than substantially all of the capacity of the pipeline. Customer X does not have the right to obtain substantially all of the economic benefits from use of the pipeline.

Land easements or rights of way are rights to use, access or cross another entity's land for a specified purpose. For example, a land easement might be obtained for the right to construct and operate a pipeline or other assets (e.g., railway line, utility pipes or telecommunication lines) over, under or through an existing area of land or body of water while allowing the landowner continued use of the land for other purposes (e.g., farming), as long as the landowner does not interfere with the rights conveyed in the land easement. A land easement may be perpetual or for a specified term. It may provide for exclusive or non-exclusive use of the land and may be prepaid or paid over a defined term.

Perpetual easements are outside the scope of Section 20, as the definition of a lease requires the contract to be for a period of time. Therefore, entities must carefully evaluate easement contracts to determine whether the contract is perpetual or for a period of time. Examples of contracts that may appear perpetual but are term-based include:

- Very long-term contracts, e.g., very long-term leases of land (e.g., 999 years) are expected to be in the scope of Section 20. This is not stated in Section 20 or IFRS 16, but the view is consistent with a point explicitly made by the FASB in the Basis for Conclusions (BC113) to ASC 842 *Leases*.
- Contracts with a stated non-cancellable lease term that 'automatically renews' if the lessee pays a periodic renewal fee. This is an in-substance fixed term contract with optional renewal periods.
- Contracts that define the period of use as the period over which the assets are used (e.g., as long as natural gas flows through a gathering system) are a fixed term contract (i.e., terminated when production ceases) rather than a perpetual contract because the gas reserves will ultimately be depleted.

When determining whether a contract for a land easement or right of way is a lease, entities will need to assess whether there is an identified asset and whether the customer obtains substantially all of the economic benefits of the identified asset and has the right to direct the use of that asset throughout the period of use.

Frequently asked questions

Question 4-1: Does Section 20 apply to the right to place an oil pipeline in underground space for a period of time in exchange for consideration?

In June 2019, the IFRS IC discussed a contract for subsurface rights. Whilst decisions of the IFRS IC do not apply directly to entities reporting under FRS 102, due to the similarities between Section 20 and IFRS 16 in this area, we would expect the analysis set out below to be relevant to entities considering a similar fact pattern under FRS 102.

In the contract described, a pipeline operator obtains the right to place an oil pipeline in underground space for 20 years in exchange for consideration. The contract specifies the exact location and dimensions (path, width and depth) of the underground space within which the pipeline will be placed. The landowner retains the right to use the surface of the land above the pipeline, but it has no right to access or otherwise change the use of the specified underground space throughout the 20-year period of use. The customer has the right to perform inspection, repairs and maintenance work (including replacing damaged sections of the pipeline when necessary).

The IFRS IC noted the following in the agenda decision:

- Paragraph 3 of IFRS 16 requires an entity to apply IFRS 16 to all leases, with limited exceptions. In the contract described in the request, none of the exceptions in IFRS 16.3 and 4 apply. In particular, the IFRS IC noted that the underground space is tangible. Accordingly, if the contract contains a lease, IFRS 16 applies to that lease. If the contract does not contain a lease, the entity would then consider which other IFRS accounting standard applies. The same observations would apply to an FRS 102 reporter. Paragraph 1 of Section 20 requires an entity to apply Section 20 to all leases, with limited exceptions, none of which apply in this fact pattern (refer to 3.1 above).
- Applying IFRS 16.B9, to meet the definition of a lease, the customer must have both:
 - The right to obtain substantially all the economic benefits from the use of an identified asset throughout the period of use.

And

 - The right to direct the use of the identified asset throughout the period of use.

This requirement is consistent with Section 20, paragraph 16.

- The specified underground space is physically distinct from the remainder of the land. The contract's specifications include the path, width and depth of the pipeline, thereby defining a physically distinct underground space. The space being underground does not in itself affect whether it is an identified asset - the specified underground space is physically distinct in the same way that a specified area of space on the land's surface would be physically distinct. As the landowner does not have the right to substitute the underground space throughout the period of use, the IFRS IC concluded that the specified underground space is an identified asset as described in IFRS 16.B13 to B20. Whilst the guidance around identified assets and substantive substitution rights in Section 20 is less extensive, similar requirements to those set out in IFRS 16.B13 to B20 are provided in paragraphs 20.19 to 21 of FRS 102.
- The customer has the right to obtain substantially all the economic benefits from use of the specified underground space throughout the 20-year period of use. The customer has exclusive use of the specified underground space throughout that period of use.
- The customer has the right to direct the use of the specified underground space throughout the 20-year period of use because the customer has the right to operate the asset throughout the period of use without the supplier having the right to change those operating instructions. How and for what purpose the specified underground space will be used (i.e., to locate the pipeline with specified dimensions through which oil will be transported) is predetermined in the contract. The customer has the right to operate the specified underground space by having the right to perform inspection, repairs and maintenance work. The customer makes all the decisions about the use of the specified underground space that can be made during the 20-year period of use.

Consequently, the IFRS IC concluded that the contract described in the request contains a lease as defined in IFRS 16. The customer would therefore apply IFRS 16 and Section 20 in accounting for that lease.

4.1.3 Substantive substitution rights

Even if an asset is specified, a customer does not have the right to use an identified asset if, at inception of the contract, a supplier has the substantive right to substitute the asset throughout the period of use (i.e., the total period of time that an asset is used to fulfil a contract with a customer, including the sum of any non-consecutive periods of time). [FRS 102 Appendix I]. A supplier's right to substitute an asset is substantive when both of the following conditions are met:

- The supplier has the practical ability to substitute alternative assets throughout the period of use (e.g., the customer cannot prevent the supplier from substituting an asset and alternative assets are readily available to the supplier or could be sourced by the supplier within a reasonable period of time).
And
- The supplier would benefit economically from the exercise of its right to substitute the asset (i.e., the economic benefits associated with substituting the asset are expected to exceed the costs associated with substituting the asset). [FRS 102.20.20].

If the supplier has a right or an obligation to substitute the asset only on or after either a particular date, or the occurrence of a specified event, the supplier's substitution right is not substantive because the supplier does not have the practical ability to substitute alternative assets throughout the period of use.

An entity's evaluation of whether a supplier's substitution right is substantive is based on facts and circumstances at inception of the contract. At inception of the contract, an entity should not consider future events that are not likely to occur. [FRS 102.20.21]. Section 20 does not provide any examples of circumstances that, at inception of the contract, are not likely to occur and, thus, are excluded from the evaluation of whether a supplier's substitution right is substantive throughout the period of use. However, entities applying FRS 102 may consider the following examples provided in IFRS 16:

- An agreement by a future customer to pay an above market rate for use of the asset.
- The introduction of new technology that is not substantially developed at inception of the contract.
- A substantial difference between the customer's use of the asset, or the performance of the asset, and the use or performance considered likely at inception of the contract.
- A substantial difference between the market price of the asset during the period of use, and the market price considered likely at inception of the contract. [IFRS 16.B16].

In many cases, it will be clear that the supplier will not benefit from the exercise of a substitution right because of the costs associated with substituting an asset. The physical location of the asset may affect the costs associated with substituting the asset. For example, if an asset is located at the customer's premises, the cost associated with substituting it is generally higher than the cost of substituting a similar asset located at the supplier's premises. However, simply because a supplier concludes that the cost of substitution is not significant does not automatically mean that it would economically benefit from the right of substitution.

Section 20 further clarifies that a customer should presume that a supplier's substitution right is not substantive when the customer cannot readily determine whether the supplier has a substantive substitution right. [FRS 102.20.21]. This requirement clarifies that a customer is not expected to exert undue effort to provide evidence that a substitution right is not substantive.

How we see it

We believe that suppliers cannot presume that their substitution rights are non-substantive because suppliers should have sufficient information to make such a determination.

Contract terms that allow or require a supplier to substitute alternative assets only when the underlying asset is not operating properly (e.g., a normal warranty provision) or when a technical upgrade becomes available do not create a substantive substitution right.

Illustration 4-5: Substitution rights**Scenario A**

Assume that an electronic data storage provider (supplier) provides services through a centralised data centre, that involve the use of a specified server (Server No. 9). The supplier maintains many identical servers in a single accessible location and determines, at inception of the contract, that it is permitted to and can easily substitute another server without the customer's consent throughout the period of use. Further, the supplier would benefit economically from substituting an alternative asset, because doing this would allow the supplier to optimise the performance of its network at only a nominal cost. In addition, the supplier has made clear that it has negotiated this right of substitution as an important right in the arrangement, and the substitution right affected the pricing of the arrangement.

Analysis: The customer does not have the right to use an identified asset because, at the inception of the contract, the supplier has the practical ability to substitute the server and would benefit economically from such a substitution. However, if the customer could not readily determine whether the supplier had a substantive substitution right (e.g., there is insufficient transparency into the supplier's operations), the customer would presume the substitution right is not substantive and conclude that there is an identified asset.

Scenario B

Assume the same facts as in Scenario A except that Server No. 9 is customised, and the supplier does not have the practical ability to substitute the customised asset throughout the period of use. Additionally, it is unclear whether the supplier would benefit economically from sourcing a similar alternative asset.

Analysis: Because the supplier does not have the practical ability to substitute the asset and there is no evidence of economic benefit to the supplier for substituting the asset, the substitution right is non-substantive, and Server No. 9 would be an identified asset. In this case, neither of the conditions of a substitution right is met. As a reminder, both conditions must be met for the supplier to have a substantive substitution right.

Frequently asked questions**Question 4-2: Does a contract contain a lease when the supplier has substitution rights that are not substantive throughout the period of use?**

In March 2023, the IFRS IC discussed a fact pattern in which a customer enters into a 10-year contract with a supplier for 100 similar batteries used in electric buses. The supplier has the practical ability to substitute alternative assets throughout the contract term and would be required to compensate the customer for any revenue lost or costs incurred while the substitution takes place. At inception of the contract, it is expected that the supplier would benefit economically from substituting the battery once it has been used for three years or more but not before.

Similar to Question 4-1 above, whilst decisions of the IFRS IC do not apply directly to entities reporting under FRS 102, as a result of the similarities between Section 20 and IFRS 16 in this area, we would expect the analysis set out below to be relevant to entities considering a similar fact pattern under FRS 102.

The IFRS IC noted that the customer is able to benefit from the use of each battery together with a bus that is readily available to it, and each battery is neither highly dependent on, nor highly interrelated with the other batteries in the contract. The supplier has the practical ability to substitute alternative batteries throughout the period of use. However, because the supplier is not expected to benefit economically from substituting a battery for at least the first three years of the contract, the supplier does not have a substantive substitution right throughout the period of use.

Therefore, in the fact pattern presented, the IFRS IC concluded that each battery is an identified asset. It follows that, in evaluating whether the contract contains a lease, the requirements in IFRS 16 need to be applied to assess whether, throughout the period of use, the customer has the right to obtain substantially all the economic benefits from use, and direct the use, of each battery.

4.1.4 Right to obtain substantially all of the economic benefits from use of the identified asset

To control the use of an identified asset, a customer is required to have the right to obtain substantially all of the economic benefits from use of the identified asset throughout the period of use (e.g., by having exclusive use of the asset throughout that period). A customer can obtain economic benefits either directly or indirectly (e.g., by using, holding or subleasing the asset). Economic benefits include the asset's primary outputs (i.e., goods or services) and any by-products (e.g., renewable energy credits that are generated through the use of the asset), including potential cash flows derived from these items. Economic benefits also include benefits from using the asset that could be realised from a commercial transaction with a third party (e.g., subleasing the asset). [FRS 102.20.23].

However, economic benefits arising from construction or ownership of the identified asset (e.g., tax benefits related to excess tax depreciation and investment tax credits) are not considered economic benefits derived from the use of the asset. Therefore, they are not considered when assessing whether a customer has the right to obtain substantially all the economic benefits.

When assessing the right to obtain substantially all the economic benefits from use of an asset, Section 20 states that an entity considers the economic benefits that result from use of the asset within the defined scope of a customer's right to use the asset. [FRS 102.20.24]. Section 20 does not further elaborate on this, but entities applying Section 20 may consider the following examples from IFRS 16 when considering the application of this requirement:

- If a contract limits the use of a motor vehicle to only one particular territory during the period of use, an entity considers only the economic benefits from use of the motor vehicle within that territory, and not beyond.
Or
- If a contract specifies that a customer can drive a motor vehicle only up to a particular number of miles during the period of use, an entity considers only the economic benefits from use of the motor vehicle for the permitted mileage, and not beyond. [IFRS 16.B22].

A contract may require a customer to pay the supplier or another party a portion of the cash flows derived from use of an asset as consideration. Section 20 does not provide explicit guidance on whether those cash flows paid as consideration in such contracts should be considered to be part of the economic benefits that the customer obtains from use of the asset. However, this matter is explicitly addressed in IFRS 16, which states that if a customer is required to pay the supplier or another party a portion of the cash flows derived from use of an asset as consideration, such cash flows are considered to be part of the economic benefits that the customer obtains from use of the asset. For example, if the customer is required to pay the supplier a percentage of sales from use of retail space as consideration for that use, that requirement does not prevent the customer from having the right to obtain substantially all the economic benefits from the use of the retail space. This is because the cash flows arising from those sales are considered to be economic benefits that the customer obtains from use of the retail space, a portion of which it then pays to the supplier as consideration for the right to use that space. [IFRS 16.B23].

How we see it

Whilst Section 20 of FRS 102 does not include the explicit requirement set out in paragraph B23 of IFRS 16, in our view, the application of paragraph 23 of Section 20 is intended to be consistent with IFRS 16. As such, if a contract requires a customer to pay the supplier or another party a portion of the cash flows derived from use of an asset as consideration, those cash flows paid as consideration are considered to be part of the economic benefits that the customer obtains from use of the asset.

4.1.5 Right to direct the use of the identified asset

A customer has the right to direct the use of an identified asset throughout the period of use when either:

- The customer has the right to direct how and for what purpose the asset is used throughout the period of use in a manner that affects the economic benefits derived from its use.
Or
- The relevant decisions about how and for what purpose an asset is used are predetermined and the customer either: (1) has the right to operate the asset (or to direct others to operate the asset in a manner that it determines), throughout the period of use, without the supplier having the right to change those operating instructions; or (2) designed the asset, or specific aspects of the asset, in a way that predetermines how and for what purpose the asset will be used throughout the period of use. [FRS 102.20.25].

4.1.5.A The right to direct how and for what purpose an asset is used throughout the period of use

A customer has the right to direct the use of an identified asset whenever it has the right to direct how and for what purpose the asset is used throughout the period of use in a manner that affects the economic benefits derived from its use. [IFRS 102.20.25(a)].

Section 20 does not provide further guidance on what is meant by 'the right to direct how and for what purpose the asset is used'. However, entities applying Section 20 may refer to the additional guidance in IFRS 16 which explains that a customer has the right to direct how and for what purpose the asset is used if, within the scope of its right of use defined in the contract, it can change how and for what purpose the asset is used throughout the period of use. When evaluating whether a customer has the right to change how and for what purpose the asset is used throughout the period of use, the focus should be on whether the customer has the decision-making rights that will most affect the economic benefits that will be derived from the use of the asset. The decision-making rights that are most relevant are likely to depend on the nature of the asset and the terms and conditions of the contract. [IFRS 16.B25].

Whilst Section 20 does not refer to the right to 'change' how and for what purpose the asset is used, the following examples of decision making rights, provided in paragraph B26 of IFRS 16, may nonetheless provide useful indicators for FRS 102 reporters to refer to:

- The right to change the type of output that is produced by the asset (e.g., deciding whether to use a shipping container to transport goods or for storage, deciding on the mix of products sold from a retail unit).
- The right to change when the output is produced (e.g., deciding when an item of machinery or a power plant will be used).
- The right to change where the output is produced (e.g., deciding on the destination of a truck or a ship, deciding where a piece of equipment is used or deployed).
- The right to change whether the output is produced and the quantity of that output (e.g., deciding whether to produce energy from a power plant and how much energy to produce from that power plant).

The following are examples of decision-making rights that do not grant the right to direct how and for what purpose an asset is used:

- Maintaining the asset
- Operating the asset

Although the decisions about maintaining and operating the asset are often essential to the efficient use of that asset, the right to make those decisions, in and of itself, does not result in the right to direct how and for what purpose the asset is used throughout the period of use.

The customer does not need the right to operate the underlying asset to have the right to direct its use. That is, the customer may direct the use of an asset that is operated by the supplier's personnel. However, as discussed below, the right to operate an asset will often provide the customer the right to direct the use of the asset if the relevant decisions about how and for what purpose the asset is used are predetermined.

How we see it

We believe that the assessment of whether a contract is or contains a lease will be straightforward in most arrangements. However, judgement may be required in applying the definition of a lease to certain arrangements. For example, in contracts that include significant services, we believe that determining whether the contract conveys the right to direct the use of an identified asset may be challenging.

4.1.5.B The relevant decisions about how and for what purpose an asset is used are predetermined

In some cases, it will not be clear whether the customer has the right to direct the use of the identified asset. This could be the case when the most relevant decisions about how and for what purpose an asset is used are predetermined by contractual restrictions on the use of the asset (e.g., the decisions about the use of the asset are agreed to by the customer and the supplier in negotiating the contract, and those decisions cannot be changed). This could also be the case when the most relevant decisions about how and for what purpose an asset is used are, in effect, predetermined by the design of the asset. In such cases, a customer has the right to direct the use of an identified asset throughout the period of use when the customer either:

- Has the right to operate the asset (or to direct others to operate the asset in a manner it determines) throughout the period of use without the supplier having the right to change those operating instructions.

Or

- Designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use. [FRS 102.20.25(b)].

Significant judgement may be required to assess whether a customer designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use. Entities applying Section 20 may wish to refer to Example 9 in IFRS 16 which illustrates the evaluation of whether a customer designed the asset in a way that predetermines how and for what purpose the asset will be used throughout the period of use.

Illustration 4-6 below explores the application of the requirements in paragraph 25 of Section 20 to a scenario in which many decisions are predetermined, applying analysis similar to that performed by the IFRS IC in their January 2020 agenda decision concerning whether the customer has the right to direct the use of a ship throughout the five-year term of a contract.

Illustration 4-6: The right to direct the use of a ship

Customer A has a contract for the use of a ship for a period of 5 years. Based on the terms of the contract:

- Customer A has determined that there is an identified asset (the ship) applying paragraphs 19 to 22 of Section 20.
- Customer A has the right to obtain substantially all the economic benefits from use of the ship throughout the five-year period through exclusive use of the ship.
- Many, but not all, decisions about how, and for what purpose, the ship is used are predetermined in the contract. The customer has the right to make the remaining decisions about how, and for what purpose, the ship is used throughout the period of use. Specifically, it has decision-making rights with respect to the order of the voyages to the designated ports during the contract term. This decision-making right affects the economic benefits to be derived from use of the ship.
- The supplier operates and maintains the ship throughout the period of use.

Analysis: In the fact pattern, because not all relevant decisions about how and for what purpose the ship is used are predetermined, Customer A considers paragraph 25(a) of Section 20 in assessing whether it has the right to direct the use of the ship. This paragraph specifies that a customer has the right to direct the use of an identified asset throughout the period of use if it has "...the right to direct how and for what purpose the asset is used throughout the period of use, in a manner that affects the economic benefits derived from its use".

Within the scope of its right of use defined in the contract, Customer A can direct how and for what purpose the ship is used as it can change the order of the voyages to the designated ports during the contract term. As set out above, this decision-making right is most relevant, as it affects the economic benefits to be derived from the use of the ship. Despite many decisions about how and for what purpose the ship is used being predetermined, such decisions define the scope of the customer's right of use. As such, Customer A has the right to make the decisions that are most relevant to directing how and for what purpose the ship is used.

Although the operation and maintenance of the ship are essential to its efficient use, the supplier's decisions in this regard do not give it the right to direct how and for what purpose the ship is used.

Therefore, Customer A has the right to direct the use of the ship throughout the period of use. Consequently, the contract contains a lease.

4.1.5.C Specifying the output of an asset before the period of use

Section 20 does not specifically address situations in which a customer can only specify the output from an asset before the beginning of the period of use and cannot change that output throughout the period of use. However, if a customer can only specify the output from an asset before the beginning of the period of use and cannot change that output throughout the period of use, then it does not have the right to direct the use of that asset, unless it designed the asset, or specific aspects of the asset. [FRS 102.20.25(b)(ii)].

If the customer did not design the asset or aspects of it, the customer's ability to specify the output in a contract that does not give it any other relevant decision-making rights relating to the use of the asset (e.g., the ability to change when, whether and what output is produced) gives the customer the same rights as any customer that purchases goods or services in an arrangement (i.e., a contract that does not contain a lease).

4.1.5.D Protective rights

A contract may include terms and conditions designed to protect the supplier's interest in the asset or other assets, to protect its personnel, or to ensure the supplier's compliance with laws or regulations. These are examples of protective rights. For example, a contract may: (i) specify the maximum amount of use of an asset or limit where or when the customer can use the asset; (ii) require a customer to follow particular operating practices; or (iii) require a customer to inform the supplier of changes in how an asset will be used. Protective rights typically define the scope of the customer's right of use but are not expected, in isolation, to prevent the customer from having the right to direct the use of an asset.

Illustration 4-7: Right to direct the use of an asset

Customer X enters into a contract with Supplier Y to use a vehicle for a three-year period. The vehicle is identified in the contract. Supplier Y cannot substitute another vehicle unless the specified vehicle is not operational (e.g., it breaks down).

Under the contract:

- Customer X operates the vehicle (i.e., drives the vehicle) or directs others to operate the vehicle (e.g., hires a driver).
- Customer X decides how to use the vehicle (within contractual limitations, discussed below). For example, throughout the period of use, Customer X decides where the vehicle goes, as well as when or whether it is used and what it is used for. Customer X can also change these decisions throughout the period of use.
- Supplier Y prohibits certain uses of the vehicle (e.g., moving it overseas) and modifications to the vehicle to protect its interest in the asset.

Analysis: Customer X has the right to direct the use of the identified vehicle throughout the period of use. Customer X has the right to direct the use of the vehicle because it has the right to change how the vehicle is used, when or whether the vehicle is used, where the vehicle goes and what the vehicle is used for.

Supplier Y's limits on certain uses for the vehicle and modifications to it are considered protective rights that define the scope of Customer X's use of the asset, but do not affect the assessment of whether Customer X directs the use of the asset.

4.1.6 Flowchart

The following flowchart is similar to one included in IFRS 16's application guidance, [IFRS 16.B31], adapted to refer to the relevant Section 20 requirements. It depicts the decision-making process for determining whether an arrangement is or contains a lease:

4.1.7 Reassessment of the contract

Under Section 20, an entity reassesses whether a contract is or contains a lease only if the terms and conditions of the contract are changed. [FRS 102.20.18]. A change in the terms and conditions of a contract does not include the exercise of an option (e.g., renewal option) or failure to exercise an option that is included in the contract.

4.1.8 Intra-group arrangements

It is not uncommon in groups for one legal entity to make an asset or assets available for use by another group company. For example, in some groups one legal entity may own properties which it leases to other companies across the group. Similarly, sometimes group companies may share properties or facilities. These arrangements may be formally documented, but this is not always the case.

There is no scope exclusion in Section 20 for intra-group arrangements and therefore, such arrangements may meet the definition of lease to be accounted for under Section 20. However, it is important to be aware that a contract which creates enforceable rights and obligations must exist in order for the definition of a lease to be met. This depends on the substance of arrangements, rather than their form. If an arrangement between group companies does not create enforceable rights and obligations, the entity or entities using an underlying asset may not be a party to a lease and therefore would not account for the arrangement under Section 20.

4.2 Identifying and separating lease and non-lease components of a contract and allocating contract consideration

A contract may contain a number of components, some of which relate to the lease of assets and others relating to non-lease elements, such as services. [FRS 102.20.27]. See below for further guidance on:

- Identifying and separating lease components of a contract (refer to 4.2.1 below).
- Identifying and separating lease from non-lease components of a contract (refer to 4.2.2 below).
- Determining and allocating the consideration in the contract - lessees (refer to 4.2.3 below).
- Determining and allocating the consideration in the contract - lessors (refer to 4.2.4 below).
- Examples - Identifying and separating components of a contract and determining and allocating the consideration in the contract (refer to 4.2.5 below).

4.2.1 Identifying and separating lease components of a contract

Extract from FRS 102

20.28 For a contract that is, or contains, a lease, an entity shall account for each lease component within the contract as a lease separately from non-lease components of the contract, unless the entity applies the practical expedient in paragraph 20.33. [FRS 102.20.28]

For contracts that contain the rights to use multiple assets (e.g., a building and equipment, multiple pieces of equipment), the right to use each asset is considered a separate lease component if both of the following criteria are met:

- The lessee can benefit from the use of the asset either on its own or together with other resources that are readily available to the lessee (i.e., goods or services that are sold or leased separately, by the lessor or other suppliers, or that the lessee has already obtained from the lessor or in other transactions or events).
- And
- The underlying asset is neither highly dependent on, nor highly interrelated with, the other underlying assets in the contract. [FRS 102.20.29].

If one or both of these criteria are not met, the right to use multiple assets is considered a single lease component.

A contract may include an amount payable by the lessee for activities and costs that do not transfer a good or service to the lessee. For example, a lessor may include in the total amount payable a charge for administrative tasks, or other costs it incurs associated with the lease, that do not transfer a good or service to the lessee. Such amounts payable do not give rise to a separate component of the contract, but are considered to be part of the total consideration that is allocated to the separately identified components of the contract. [FRS 102.20.30].

Illustration 4-8: Identifying and separating lease components

Scenario A

Assume that a lessee enters into a lease of an excavator and the related accessories (e.g., excavator attachments) that are used for mining purposes. The lessee is a local mining company that intends to use the excavator at a copper mine.

Analysis: From the perspective of the lessee, the contract contains one lease component. The lessee would be unable to benefit from the use of the excavator without also using the accessories. Therefore, the excavator is dependent upon the accessories.

Scenario B

Assume the same facts as in Scenario A, except that the contract also conveys the right to use an additional loading truck. This loading truck could be deployed by the lessee for other uses (e.g., to transport iron ores at another mine).

Analysis: From the perspective of the lessee, the contract contains two lease components: a lease of the excavator (together with the accessories) and a lease of the loading truck. Because the loading truck could be deployed for other uses independent of the excavator, the lessee can benefit from the loading truck on its own or together with other readily available resources. The lessee can also benefit from the use of the excavator on its own or together with other readily available resources.

Section 20 does not include any specific guidance in respect of contracts that involve the right to use land and land improvements (e.g., buildings). In contrast, IFRS 16 includes specific guidance on this matter which requires a lessor to classify (refer to 7.1 below) and account for the right to use land as a separate lease component, unless the accounting effect of doing so is immaterial to the lease. [IFRS 16.B57]. Despite the absence of a paragraph directly equivalent to paragraph B57 of IFRS 16, Section 20 nonetheless requires entities to account for each lease component within the contract separately, if the conditions in paragraph 29 of Section 20 are met (see above).

Separation of the land may not be necessary when the amount that would be recognised for the land lease component is immaterial to the lease.

How we see it

An entity that leases an entire building (i.e., 100% of the building) is inherently leasing the land underneath the building and would potentially account for the land and the building as separate lease components. However, when an entity only leases part of the building (e.g., one floor of a multi-storey building) the land may not be a separate lease component as the lessee does not control substantially all the benefits of the shared land.

4.2.2 Identifying and separating lease from non-lease components of a contract

Many contracts contain a lease coupled with an agreement to purchase or sell other goods or services (non-lease components). The non-lease components are identified and accounted for separately from the lease component in accordance with other sections of FRS 102 (except when a lessee applies the practical expedient as discussed in 4.2.2.B below). [FRS 102.20.28, FRS 102.20.34]. For example, the non-lease components may be accounted for as executory arrangements by lessees (customers) or as contracts subject to Section 23 by lessors (suppliers). Non-lease components are also within the scope of Section 21 *Provisions and Contingencies*, as discussed in Chapter 24 at 3.3.1.A.

In order to account for non-lease components separately entities are required to allocate the consideration in the contract to the lease and non-lease components on a relative stand-alone price basis (refer to 4.2.3.B and 4.2.4.B below). [FRS 102.20.31].

Some contracts contain items that do not relate to the transfer of goods or services by the lessor to the lessee (e.g., fees or other administrative costs a lessor charges a lessee). These items are not considered separate lease or non-lease components, and lessees and lessors do not allocate consideration in the contract to these items (refer to 4.2.2.A and 4.2.2.B below). [FRS 102.20.30].

However, if the lessor provides services (e.g., maintenance, supply of utilities) or operates the underlying asset (e.g., vessel charter, aircraft wet lease), the contract will generally contain non-lease components.

4.2.2.A Payments that do not transfer a good or service to the lessee

Under Section 20, payments made by the lessee to the lessor for maintenance activities, including common area maintenance (e.g., cleaning the common areas of a building, removing snow from a car park for employees and customers) and other goods or services transferred to the tenant (e.g., providing utilities or rubbish removal) are considered non-lease components because they provide the lessee with a service.

In some leases, a lessee also may make payments to or on behalf of the lessor to reimburse the lessor for costs that relate to the leased asset but do not transfer a good or service to the lessee. Examples may include payments made for real estate taxes that would be owed by the lessor regardless of whether it leased the building and regardless of who the lessee is, or payments made for insurance that protects the lessor's investment in the asset where the landlord will receive the proceeds from any claim. Under Section 20, such costs are not separate components of the contract because they do not represent payments for goods or services and are considered to be part of the total consideration that is allocated to the separately identified components of the contract (i.e., the lease and non-lease components). [FRS 102.20.30]. Entities also need to evaluate whether such payments are fixed (or in-substance fixed) lease payments or variable lease payments (refer to 5.5 below).

Illustration 4-9: Activities that are not components of a lease contract**Scenario A**

A lessee enters into a three-year lease of equipment, with fixed annual payments of £12,000. The contract itemises the fixed annual payments as follows: £9,000 for rent, £2,500 for maintenance and £500 for administrative tasks.

Analysis: The contract contains two components - a lease component (lease of equipment) and a non-lease component (maintenance). The amount paid for administrative tasks does not transfer a good or service to the lessee. Therefore, the total consideration in the contract of £36,000 will be allocated to the lease component (equipment) and the non-lease component (maintenance).

Scenario B

Assume the fact pattern as in scenario A except that, in addition, the contract requires the lessee to pay for the restoration of the equipment to its original condition.

Analysis: The contract still contains two components - a lease component (lease of equipment) and a non-lease component (maintenance). Similar to the amount paid for administrative tasks, the restoration does not transfer a good or service to the lessee as it is only performed at the end of the lease term. Therefore, the total consideration in the contract will be allocated to the lease component (equipment) and the non-lease component (maintenance). Refer to 6.2.1 below for further discussion on the inclusion of restoration costs to the initial measurement of the right-of-use asset.

4.2.2.B Practical expedient - lessees

Section 20 provides a practical expedient that permits lessees to make an accounting policy election, by class of underlying asset, to account for each separate lease component of a contract and any associated non-lease components as a single lease component. [FRS 102.20.33]. The practical expedient does not allow lessees to account for multiple lease components of a contract (refer to 4.2.1 above) as a single lease component. Refer to 6 below for a discussion of measurement of right-of-use assets and lease liabilities.

How we see it

Although it is not explicitly stated, we believe that for the purposes of applying the practical expedient, non-lease components which can be combined with lease components are those components that relate to services contained within the lease contract. Therefore, when a lease includes a component related to the purchase of inventory or another asset such as property, plant and equipment or an intangible asset, we believe an entity should separate asset purchases from the lease components and other non-lease components.

The separate asset purchases would not be combined with lease and other non-lease components, even if the entity has elected to apply the practical expedient to combine lease and non-lease components to the class of underlying asset to which the lease relates. For example, if a contract contains a lease as well as non-lease components related to a service and the purchase of sheet metal to be used in the construction of inventory, we believe the purchase of the sheet metal should be accounted for as a component of inventory rather than together with the lease component as the purchase of a physical good is not a 'non-lease component associated with that lease component'.

Lessees that make the policy election to account for each separate lease component of a contract and any associated non-lease components as a single lease component, allocate all of the contract consideration to the lease component. Therefore, the initial and subsequent measurement of the lease liability and right-of-use asset is higher than if the policy election was not applied.

Section 20 does not include an equivalent practical expedient for lessors, and therefore lessors are always required to allocate the consideration in the contract between the lease and non-lease components.

4.2.3 Determining and allocating the consideration in the contract - lessees

4.2.3.A Determining the consideration in the contract

Section 20 does not define 'consideration' in a lease contract, nor is 'consideration' defined in the FRS 102 Glossary.

How we see it

We believe that the consideration in a contract for a lessee includes the lease payments as defined in Appendix I to FRS 102 (described in 5.5 below) as well as variable payments that do not depend on an index or a rate and any other amounts in the contract that are not included in lease payments. Only those amounts that meet the definition of lease payments are included in the lease liability at their present value (refer to 6.2.2 below).

4.2.3.B Allocating the consideration in the contract - lessees

Lessees that do not make an accounting policy election (by class of underlying asset) to use the practical expedient (refer to 4.2.2.B above) to account for each separate lease component of a contract and any associated non-lease components as a single lease component are required to allocate the consideration in the contract to the lease and non-lease components on a relative stand-alone price basis. Lessees are required to use observable stand-alone prices (i.e., prices at which a customer would purchase a component of a contract separately) when available. If observable stand-alone prices are not readily available, lessees estimate stand-alone prices, maximising the use of observable information. Although a contractually stated price may be the stand-alone price for a good or service, it is not presumed to be for accounting purposes.

[FRS 102.20.31, FRS 102.20.32].

Illustration 4-10: Allocating contract consideration to lease and non-lease components - lessees

A lessee enters into a lease of equipment. The contract stipulates the lessor will perform maintenance of the leased equipment and receive consideration for that maintenance service. The contract includes the following fixed prices for the lease and non-lease component:

Lease	£80,000
Maintenance	£10,000
Total	£90,000

Assume the stand-alone prices cannot be readily observed, so the lessee makes estimates, maximising the use of observable information, of the lease and non-lease components, as follows:

Lease	£85,000
Maintenance	£15,000
Total	£100,000

Analysis: The stand-alone price for the lease component represents 85% of total estimated stand-alone prices. The lessee allocates the consideration in the contract (£90,000), as follows:

Lease	£76,500 ⁽¹⁾
Maintenance	£13,500 ⁽²⁾
Total	£90,000

(1) $85\% \times £90,000$

(2) $15\% \times £90,000$

4.2.4 Determining and allocating the consideration in the contract - lessors

4.2.4.A Determining the consideration in the contract - lessors

As discussed in 4.2.3.A above, Section 20 does not define 'consideration' in a lease contract, nor is 'consideration' defined in the FRS 102 Glossary.

How we see it

We believe that the consideration in a lease contract for a lessor would include the following:

- Lease payments (refer to 5.5).
- Any other fixed payments (e.g., monthly service charges, non-lease components such as maintenance) or in-substance fixed payments made during the lease term, less any incentives paid or payable to the lessee.
- Any other variable payments that depend on an index or a rate made during the lease term and initially measured using the index or rate at the commencement date (refer to 5.5.3 below).
- Any other variable payment amounts that would be included in the transaction price in accordance with the requirements on variable consideration in Section 23.

Variable consideration is described broadly in Section 23 and can take many forms. Consideration can vary because of discounts, rebates, refunds, credits, price concessions, incentives, performance bonuses, penalties or other similar items. It is important for lessors to appropriately identify the different types of variable consideration included in the contract because estimating variable consideration requires lessors to apply a constraint to each type of variable consideration. Refer to Chapter 25 at 6.2 for further discussion on variable consideration under Section 23.

4.2.4.B Allocating the consideration in the contract - lessors

When applying Section 20, lessors are required to apply paragraphs 65 to 74 of Section 23 to allocate the consideration in the contract between the lease and non-lease components on a relative stand-alone selling price basis. In addition, lessors are required to apply paragraphs 75 to 77 of Section 23 to allocate any subsequent changes in the consideration of the contract between the lease and non-lease components. The stand-alone selling price is the price at which an entity would sell a promised good or service separately to a customer. When stand-alone selling prices are not directly observable, the lessor must estimate the stand-alone selling price. [FRS 102.23.68, FRS 102.23.69]. Paragraph 70 of Section 23 provides suitable methods for estimating the stand-alone selling price. [FRS 102.20.36]. Refer to Chapter 25 at 7.1 for further discussion on determining stand-alone selling prices under Section 23.

How we see it

Personnel responsible for an entity's revenue recognition policies (including revenue recognition policies associated with arrangements that include a lease) may need to obtain information from personnel beyond those in the accounting or finance departments to estimate stand-alone selling prices. That is, they may need to gain information and an understanding of an entity's pricing decisions in order to determine estimated stand-alone selling prices, especially when there are limited or no observable inputs.

4.2.5 Examples - Identifying and separating components of a contract and determining and allocating the consideration in the contract

The following example is based on Illustrative Example 12 in IFRS 16. It illustrates how lessees identify and separate lease and non-lease components of a contract, and determine and allocate the consideration in the contract. [IFRS 16.IE4, IFRS 16.IE Example 12].

Illustration 4-11: Lessee allocation of consideration to lease and non-lease components of a contract

Lessor leases a bulldozer, a truck and a long-reach excavator to Lessee to be used in Lessee's mining operations for four years. Lessor also agrees to maintain each item of equipment throughout the lease term. The total consideration in the contract is £600,000, payable in annual instalments of £150,000, and a variable amount that depends on the hours of work performed in maintaining the long-reach excavator. The variable payment is capped at 2 per cent of the replacement cost of the long-reach excavator. The consideration includes the cost of maintenance services for each item of equipment.

Lessee accounts for the non-lease components (maintenance services) separately from each lease of equipment applying paragraph 28 of Section 20. Lessee does not elect the practical expedient in paragraph 33. The lessee considers the requirements in paragraph 29 of Section 20 and concludes that the lease of the bulldozer, the lease of the truck and the lease of the long-reach excavator are each separate lease components. This is because:

- Lessee can benefit from use of each of the three items of equipment on its own or together with other readily available resources (for example, Lessee could readily lease or purchase an alternative truck or excavator to use in its operations).
- And
- Although Lessee is leasing all three items of equipment for one purpose (i.e., to engage in mining operations), the machines are neither highly dependent on, nor highly interrelated with, each other. Lessee's ability to derive benefit from the lease of each item of equipment is not significantly affected by its decision to lease, or not lease, the other equipment from Lessor.

Consequently, Lessee concludes that there are three lease components and three non-lease components (maintenance services) in the contract. Lessee applies the guidance in paragraphs 31-32 of Section 20 to allocate the consideration in the contract to the three lease components and the non-lease components.

Several suppliers provide maintenance services for a similar bulldozer and a similar truck. Accordingly, there are observable standalone prices for the maintenance services for those two items of leased equipment. Lessee is able to establish observable stand-alone prices for the maintenance of the bulldozer and the truck of £32,000 and £16,000, respectively, assuming similar payment terms to those in the contract with Lessor. The long-reach excavator is highly specialised and, accordingly, other suppliers do not lease or provide maintenance services for similar excavators. Nonetheless, Lessor provides four-year maintenance service contracts to customers that purchase similar long-reach excavators from Lessor. The observable consideration for those four-year maintenance service contracts is a fixed amount of £56,000, payable over four years, and a variable amount that depends on the hours of work performed in maintaining the long-reach excavator. That variable payment is capped at 2 per cent of the replacement cost of the long-reach excavator. Consequently, Lessee estimates the stand-alone price of the maintenance services for the long-reach excavator to be £56,000 plus any variable amounts. Lessee is able to establish observable stand-alone prices for the leases of the bulldozer, the truck and the long-reach excavator of £170,000, £102,000 and £224,000, respectively.

Lessee allocates the fixed consideration in the contract (£600,000) to the lease and non-lease components as follows:

£	Bulldozer	Truck	Long-reach excavator	Total
Lease	170,000	102,000	224,000	496,000
Non-lease				104,000
Total fixed consideration				600,000

Lessee allocates all of the variable consideration to the maintenance of the long-reach excavator, and, thus, to the non-lease components of the contract. Lessee then accounts for each lease component applying the guidance in Section 20, treating the allocated consideration as the lease payments for each lease component.

4.3 Contract combinations

Section 20 requires that two or more contracts entered into at or near the same time with the same counterparty (or related parties of the counterparty) be considered a single contract if any one of the following criteria is met:

- The contracts are negotiated as a package with an overall commercial objective that cannot be understood without considering the contracts together.
- The amount of consideration to be paid in one contract depends on the price or performance of the other contract.
- The rights to use the underlying assets conveyed in the contracts (or some of the rights to use underlying assets conveyed in each of the contracts) are a single lease component (refer to 4.2.1 above). *[FRS 102.20.14]*.

A lease-leaseback transaction, also referred to as a lease-in lease-out (LILO) transaction, in which the owner of an asset leases the asset to a third party and then leases it back, often for tax-driven purposes, is an example of when the contract combination guidance should be followed. When the contract combination guidance is met in a lease-leaseback transaction, it is often determined that a lease does not exist, as the right to control the use of the asset is not conveyed from the owner to the third party when both the original lease out and the leaseback are considered a single arrangement. For example, an entity leases its medical equipment with a 10-year useful life to a third party and then leases the equipment back for the first seven years. In this case, the right to control the use of the equipment is not transferred to the third party until the completion of the leaseback period (i.e., the first seven years). Therefore, the entity would record the transaction as a financing during the leaseback period and then account for the lease to the third party at the end of the leaseback period (and allocate the consideration in the contract accordingly).

5 Requirements of Section 20 for leases: Key concepts

Lessees and lessors generally apply the same key concepts for the purposes of identifying, recognising and measuring lease contracts.

5.1 Inception of a contract

At the inception of a contract, an entity assesses whether the contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. Paragraphs 19 to 26 of Section 20 set out guidance on the assessment of whether a contract is, or contains, a lease. [FRS 102.20.15].

Section 20 requires customers and suppliers to determine whether a contract is or contains a lease at the inception of the contract. The inception date of a lease is the earlier of the date of a lease agreement and the date of commitment by the parties to the principal terms and conditions of the lease. [FRS 102 Appendix I].

After the inception of the lease, but before the commencement date (refer to 5.2 below), the requirements in Section 21 apply to any contract (and, hence, any lease contract) that becomes onerous as defined in that standard (refer to Chapter 24 at 3.3.1.A).

5.2 Commencement date of the lease

Extract from FRS 102

Appendix I

Glossary

commencement date of the lease (commencement date)	The date on which a lessor makes an underlying asset available for use by a lessee.
underlying asset	An asset that is the subject of a lease, for which the right to use that asset has been provided by a lessor to a lessee.

The commencement date is the date on which the lessor makes an underlying asset (i.e., the asset that is subject to the lease) available for use by the lessee. [FRS 102 Appendix I]. In some cases, the commencement date of the lease may be before the date stipulated in the lease agreement (e.g., the date on which rents become due and payable). This often occurs when the leased space is modified by the lessee prior to commencing operations in the leased space (e.g., during the period a lessee uses the leased space to construct its own leasehold improvements). If a lessee takes possession of, or is given control over, the use of the underlying asset before it begins operations or making lease payments under the terms of the lease, the lease term has commenced even if the lessee is not required to pay rent or the lease arrangement states the lease commencement date is a later date. The timing of when lease payments begin under the contract does not affect the commencement date of the lease. For example, a lessee (except for a lessee applying the short-term lease or low-value asset exemption discussed in 6.1.1 below and 6.1.2 below) initially recognises a lease liability and related right-of-use asset on the commencement date and a lessor (for finance leases) initially recognises its net investment in the lease on the commencement date.

5.3 Lessee involvement with the underlying asset before the commencement date

An entity may negotiate a lease before the underlying asset is available for use by the lessee. For some leases, the underlying asset may need to be constructed or redesigned for use by the lessee. Depending on the terms and conditions of the contract, a lessee may be required to make payments relating to the construction or design of the asset.

If the lessee incurs costs relating to the construction or design of an underlying asset, the lessee accounts for those costs applying other sections of FRS 102, such as Section 17 *Property, Plant and Equipment*. Costs relating to the construction or design of an underlying asset do not include payments made by the lessee for the right to use the underlying asset. Payments for the right to use an underlying asset are payments for a lease, regardless of the timing of those payments.

Section 20 does not address situations in which the lessee may obtain legal title to an underlying asset before that legal title is transferred to the lessor and the asset is leased to the lessee. IFRS 16 contains specific guidance on such transactions. Paragraph B46 of IFRS 16 clarifies, if the lessee controls (or obtains control of) the underlying asset before the asset is transferred to the lessor, the transaction is a sale and leaseback. The guidance in IFRS 16 is expected to be equally relevant to entities applying the hierarchy on selecting accounting policies as set out in Section 10. [IFRS 16.B45-IFRS 16.B47].

5.4 Lease term and purchase options

5.4.1 Lease term

The lease term begins at the lease commencement date and is determined on that date based on the non-cancellable term of the lease, together with both of the following:

- The periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option.
- The periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option. If only the lessor has the right to terminate the lease, the non-cancellable period of the lease includes the period covered by the lessor's option to terminate the lease. [FRS 102.20.38, FRS 102 Appendix I].

Purchase options should be assessed in the same way as options to extend the lease term or terminate the lease. As a result of the definition of lease term, when a lease contains options resulting in the lessee being able to choose between a shorter or a longer period, the lease term is assessed to be the shorter period unless the lessee is reasonably certain to choose the longer period. [FRS 102.20.40]. This is the case regardless of whether the option is structured as a 'termination option' or an 'extension option'. The assessment of lease term is always based on whether the lessee is reasonably certain to continue to use the asset for the longer period.

The lease term begins at the commencement date and includes any rent-free periods provided to the lessee by the lessor. [FRS 102.20.37].

At the commencement date, an entity assesses whether the lessee is reasonably certain to exercise an option to extend the lease or to purchase the underlying asset, or not to exercise an option to terminate the lease. [FRS 102.20.40]. Examples of factors to consider include, but are not limited to:

- Contractual terms and conditions for the optional periods compared with market rates.
- Significant leasehold improvements expected to have significant economic benefit when the option becomes exercisable.
- Costs relating to the termination of the lease.
- The importance of that underlying asset to the lessee's operations.

And

- Conditionality associated with exercising the option. [FRS 102.20.41].

5.4.1.A Evaluating lease term and purchase options

When evaluating whether a lessee is reasonably certain to exercise an option to renew the lease, not terminate the lease or to purchase the underlying asset, it will be necessary for lessees and lessors to assess all relevant factors that create an economic incentive for the lessee to exercise lease renewal, termination or purchase options. The phrase reasonably certain is generally interpreted as a high threshold.

The longer the period from commencement of the lease (refer to 5.2 above) to the exercise date of an option, the more difficult it will be, in certain cases, to determine whether the exercise of the option is reasonably certain. The difficulty arises from several factors. For example, a lessee's estimates of its future needs for the leased asset become less precise the further into the future the forecast goes. Also, the future fair value of certain assets such as those involving technology is more difficult to predict than the future fair value of a relatively stable asset, such as a fully leased commercial office building located in a prime area.

The further into the future that the option date is, the lower the option price must be in relation to the estimated future fair value to conclude that the lessee is reasonably certain to exercise the option. The difference between the option price and the estimated future fair value of an asset that is subject to significant changes in value also should be greater than would be the case for an asset with a relatively stable value.

An artificially short lease term (e.g., a lease of a corporate headquarters, distribution facility, manufacturing plant or other key property with a four-year lease term), may effectively create a significant economic incentive for the lessee to exercise a purchase or renewal option. This may be evidenced by the significance of the underlying asset to the lessee's continuing operations and whether, absent the option, the lessee would have entered into such a lease.

Similarly, the significance of the underlying asset to the lessee's operations may affect a lessee's decisions about whether it is reasonably certain to not exercise a purchase or exercise a renewal option. For example, an entity that leases a specialised facility (e.g., manufacturing plant, distribution facility, corporate headquarters) and does not exercise a purchase or renewal option would face a significant economic penalty if an alternative facility is not readily available. This would potentially have an adverse effect on the entity while it searched for a replacement asset.

An option to extend or terminate a lease may be combined with one or more other contractual features (for example, a residual value guarantee) such that the lessee guarantees the lessor a minimum or fixed cash return that is substantially the same regardless of whether the option is exercised. In such cases, and notwithstanding the guidance on in-substance fixed payments (refer to 5.5.1 below), although not explicitly stated in Section 20, one may typically assume that the lessee is reasonably certain to exercise the option to extend the lease, or not to exercise the option to terminate the lease (since any cost saving associated with ending the lease at the option date is insignificant).

The shorter the non-cancellable period of a lease, the more likely a lessee is to exercise an option to extend the lease or not to exercise an option to terminate the lease. This is because the costs associated with obtaining a replacement asset are likely to be proportionately higher the shorter the non-cancellable period.

A lessee's past practice regarding the period which it has typically used similar assets may provide information that is helpful in assessing whether the lessee is reasonably certain to exercise, or not to exercise, an option. [FRS 102.20.42].

A lessee may enter into a lease contract for non-consecutive periods. This is seen in the retail industry when retailers enter into contracts with shopping centres to lease the same retail space for certain non-consecutive months of the year (e.g., during an annual holiday period). Similar arrangements also exist when sports teams lease a sports stadium for particular non-consecutive days of the year. These arrangements will usually meet the definition of a lease because during the agreed period of use, the customer controls the right to use the underlying asset. In these arrangements, the lease term is the aggregate of the non-consecutive periods, as shown in Illustration 5-1 Scenario C below.

Illustration 5-1: Determining the lease term

Scenario A

Entity P enters into a lease for equipment that includes a non-cancellable term of four years and a two-year fixed-priced renewal option with future lease payments that are intended to approximate market rates at lease inception. There are no termination penalties or other factors indicating that Entity P is reasonably certain to exercise the renewal option.

Analysis: At the lease commencement date, the lease term is four years.

Scenario B

Entity Q enters into a lease for a building that includes a non-cancellable term of four years and a two-year, market-priced renewal option. Before it takes possession of the building, Entity Q pays for leasehold improvements. The leasehold improvements are expected to have significant value at the end of four years, and that value can only be realised through continued occupancy of the leased property.

Analysis: At lease commencement, Entity Q determines that it is reasonably certain to exercise the renewal option because it would suffer a significant economic penalty if it abandoned the leasehold improvements at the end of the initial non-cancellable period. At lease commencement, Entity Q concludes that the lease term is six years.

Scenario C

Entity R enters into a lease for an identified retail space in a shopping centre. The retail space will be available to Entity R for only the months of October, November and December during a non-cancellable term of five years. The lessor agrees to provide the same retail space for each of the five years.

Analysis: At the lease commencement date, the lease term is 15 months (three months per year over the five annual periods specified in the contract).

Scenario D

Entity S enters into a lease for an office building with a stated term of 10 years, subject to a lessee only break clause (termination option) at the end of year 5. The rent on the property would be reviewed to a market rate in the event that the break option is not exercised. Entity S pays for leasehold improvements to the building to configure the office space. The leasehold improvements are expected to have a useful life of five years. There are no termination penalties and there are no other factors indicating that Entity S is reasonably certain to remain in the property beyond the end of the non-cancellable period of 5 years.

Analysis: In this example the option is structured as a termination option, but nonetheless, the considerations are the same as for renewal options. The lessee must assess whether it is reasonably certain not to exercise the termination option i.e., whether it is reasonably certain to choose to remain in the property for the longer period of 10 years. At the lease commencement date, Entity S determines it not reasonably certain to not exercise the termination option, therefore the lease term is 5 years.

5.4.1.B Cancellable leases**Extract from FRS 102**

20.39 In assessing the length of the non-cancellable period of a lease, an entity shall determine the period for which the contract is enforceable. A lease is no longer enforceable when the lessee and the lessor each has the right to terminate the lease without permission from the other party with no more than an insignificant penalty.

Any non-cancellable periods (by the lessee and the lessor) in contracts that meet the definition of a lease are considered part of the lease term. If only the lessor has the right to terminate a lease, the period covered by the option to terminate the lease is included in the non-cancellable period of the lease.

[FRS 102.20.38]. If only the lessee has the right to terminate a lease, that right is a termination option that is considered when determining the lease term (refer to 5.4.1 above).

An arrangement is not enforceable if both the lessor and lessee each have the right to terminate the lease without permission from the other party and with no more than an insignificant penalty. The question arises as to whether 'penalty' should be interpreted to include only the contractual amount payable by one party to the other if the termination option is exercised (i.e., the narrow interpretation) or whether significant economic disincentives should also be considered a penalty (i.e., the wide interpretation). With respect to the determination of the lease term, Section 20 provides a number of factors to consider, but this list is not exhaustive, and we would expect an entity to consider all relevant facts and circumstances that create an economic incentive for the lessee to exercise, or not to exercise, the option. This suggests that it may also be appropriate to consider all aspects of termination penalties, whether contractual or financial in nature.

In determining the lease term and assessing the length of the non-cancellable period of a lease, an entity applies the definition of a contract in the Glossary to FRS 102 and determines the period for which it is enforceable. As above, a lease is no longer enforceable when the lessee and lessor each have the right to terminate the lease without permission from the other party and with no more than an insignificant penalty. [FRS 102.20.39].

To determine the lease term, an entity determines the non-cancellable period and the enforceable period. It then determines where the lease term falls, depending on the likelihood of exercising the options to extend or terminate using the reasonably certain threshold. In November 2019, the IFRS IC issued an agenda decision about how to determine the lease term of a cancellable lease. In their associated agenda paper, they included the diagram below. This provides a useful summary of the impact of multiple operational periods on the assessment of lease term which would be equally relevant to entities applying Section 20¹⁰⁷.

¹⁰⁷ [AP4: Lease term and useful life of leasehold improvements \(IFRS 16 and IAS 16\)–Agenda decision to finalise \(November Interpretations Committee meeting paper\)](#)

In many jurisdictions, property leases are subject to local property laws in addition to the contractual terms of the lease arrangement. This is the case in the UK, where some commercial property leases are subject to the provisions of the Landlord and Tenants Act 1954 ('LTA'). The LTA grants statutory rights to a new tenancy in some circumstances once the lease expires.

As is the case for IFRS 16, there is no guidance in Section 20 addressing the accounting for such statutory rights offered to tenants. However, entities will need to consider the implications of any rights granted to them as a consequence of the LTA, in particular, whether an enforceable contract still exists on expiry of the lease term and if so, for what period the lease is enforceable and what the non-cancellable period of the lease is. In the case of IFRS reporters, diversity has been observed in practice with regards to the accounting for leases where occupation continues beyond the end of their contractual term, including when the LTA applies. It has been observed that some entities treat such leases as short-term once the contractual term has expired, expensing the rental cost as incurred until they vacate, or a new lease is negotiated. Other entities have accounted for these arrangements on the same basis as the expired lease, where eventual renewal is considered reasonably certain. Where such leases are material to an entity, disclosure of how they are accounted for, and of any related significant judgements should be provided.

Section 20 applies to contracts that are referred to as 'cancellable', 'month-to-month', 'at will', 'evergreen', 'perpetual' or 'rolling' if they create enforceable rights and obligations. These types of leases generally allow for the contract to continue beyond a non-cancellable period until one party gives notice to terminate the contract (e.g., the contract will roll monthly until the lessee or the lessor elect to terminate the contract). In these situations, an entity needs to consider carefully for what period the lease is enforceable, and what the non-cancellable period of the lease is. If both the lessee and the lessor can terminate the contract without more than an insignificant penalty at any time at or after the end of the non-cancellable term, then there are no enforceable rights and obligations beyond the non-cancellable term (i.e., the lease term is limited to the non-cancellable term). However, if only the lessee holds a renewal option, there may be other factors to consider in order to determine whether the lessee is reasonably certain to extend the lease, including economic disincentives discussed above.

Illustration 5-2: Cancellable leases

A lease contract has an initial non-cancellable period of one year and an extension for an additional year if both the lessee and the lessor agree. There is no penalty if the lessee and the lessor do not agree to extend for the additional year. The initial one-year non-cancellable period meets the definition of a contract because it creates enforceable rights and obligations. However, the one-year extension period does not meet the definition of a contract because both the lessee and the lessor could unilaterally elect to not extend the arrangement without a more than insignificant penalty. That is, at lease commencement, neither party has enforceable rights and obligations beyond the initial non-cancellable period.

5.4.2 Reassessment of the lease term and purchase options

5.4.2.A Reassessment of the lease term and purchase options- lessees

After lease commencement (refer to 5.2 above), Section 20 requires lessees to monitor leases for significant changes that could trigger a change in the lease term. Lessees are required to reassess the lease term upon the occurrence of either a significant event or a significant change in circumstances that:

- Is within the control of the lessee.
- Affects whether the lessee is reasonably certain to exercise an option not previously included in its determination of the lease term, or not to exercise an option previously included in its determination of the lease term. [FRS 102.20.43].

Section 20 does not provide examples of such significant events or changes in circumstances within the lessees control, but entities may refer to IFRS 16 which states that examples include:

- Constructing significant leasehold improvements not anticipated at the commencement date that are expected to have significant economic benefit for the lessee when the option becomes exercisable.
- Making significant modifications or customisations to the underlying asset not anticipated at the commencement date.
- Making a business decision that is directly relevant to the lessee's ability to exercise, or not to exercise, an option (e.g., extending the lease of a complementary asset or disposing of an alternative asset).
- Subleasing the underlying asset for a period beyond the exercise date of the option. [IFRS 16.B41].

Changes in market-based factors (e.g., a change in market rates to lease or purchase a comparable asset) are not within the lessee's control, and they therefore do not trigger a reassessment by themselves.

Section 20 also requires lessees to revise the lease term if there is a change in the non-cancellable period of a lease. Such a change could arise from the lessee exercising an option not previously included in the determination of the lease term or not exercising an option previously included in the determination of the lease term. [FRS 102.20.44].

As the lessee is required to reassess the lease term upon the occurrence of either a significant event or a significant change in circumstances that is within the control of the lessee, the revision of the lease term often happens before the actual exercise of the option in these circumstances. Additionally, if the reassessment of lease term or the exercise of a purchase option results in a change, the lessee would remeasure the lease liability, using revised inputs (e.g., discount rate) at the reassessment date, and would adjust the right-of-use asset. However, if the right-of-use asset is reduced to zero, the lessee would recognise any remaining amount in profit or loss (refer to 5.5.12 below).

5.4.2.B Reassessment of the lease term and purchase options - lessors

Section 20 requires the lessor to revise the lease term if there is a change in the non-cancellable period of a lease. Such a change could arise from the lessee exercising an option not previously included in the determination of the lease term or not exercising an option previously included in the determination of the lease term. [FRS 102.20.44].

5.5 Lease payments

Lease payments are payments, made by a lessee to a lessor, relating to the right to use an underlying asset during the lease term and include the following amounts:

- Fixed (including in-substance fixed) payments, less any lease incentives (refer to 5.5.1 below and 5.5.2 below).
- Variable lease payments that depend on an index or a rate (refer to 5.5.3 below).
- The exercise price of a purchase option if the lessee is reasonably certain to exercise that option (refer to 5.5.4 below).
- Payments of penalties for terminating a lease, if the lease term reflects the lessee exercising an option to terminate the lease (refer to 5.5.5 below).
- Amounts expected to be payable by the lessee under residual value guarantees (lessee only) (refer to 5.5.6 below).
- Residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee (lessor only) (refer to 5.5.7 below). [FRS 102 Appendix I].

Lease payments generally also include payments made by a lessee to a third party on behalf of the lessor. Lease payments do not include payments allocated to non-lease components of a contract, unless the lessee elects to combine non-lease components with a lease component and to account for them as a single lease component (refer to 4.2.2.B above).

Section 20 does not specifically address non-cash consideration that may be part of the consideration provided to the lessor. For example, a lessee may lease land to construct its own building and agree to transfer, at the end of the construction period, certain equipment used in construction. The transfer of such equipment supplements the cash consideration for use of the underlying land.

How we see it

We believe that non-cash consideration provided to the lessor is included in total consideration for purposes of initially recognising and measuring lease related assets and liabilities. This is because the total cost to the lessee, negotiated by the lessee and lessor, includes all forms of consideration, including any non-cash consideration. Applying this to the example above, the non-cash consideration is treated as a fixed payment, as the contract requires delivery of the equipment at the end of the construction period. Therefore, the consideration is measured at lease commencement at the fair value of the promise to deliver, at the end of the lease term, the equipment as stipulated in the contract.

5.5.1 In-substance fixed lease payments

Extract from FRS 102

- 20.52** In-substance fixed lease payments are payments that may, in form, contain variability but that, in substance, are unavoidable. In-substance fixed lease payments exist, for example, if:
- (a) there is no genuine variability, for example:
 - (i) payments that must be made only if an asset is proven to be capable of operating during the lease, or only if an event occurs that has no genuine possibility of not occurring; or
 - (ii) payments that are initially structured as variable lease payments linked to the use of the underlying asset but for which the variability will be resolved at some point after the commencement date so that the payments become fixed for the remainder of the lease term. Those payments become in-substance fixed payments when the variability is resolved;
 - (b) there is more than one set of payments that could be made, but only one of those sets is realistic; or
 - (c) there is more than one realistic set of payments that could be made, but one of these sets must be paid. In this case, the set of payments with the lowest discounted amount shall be selected.

[FRS 102.20.52]

Some lease agreements include payments that are described as variable, or may appear to contain variability, but are in-substance fixed payments because the contract terms ensure that the payment of a fixed amount is unavoidable. Such payments are included in the lease payments at lease commencement and thus used to measure entities' lease assets and lease liabilities. [FRS 102.20.51(a)].

5.5.2 Lease incentives

Extract from FRS 102

Appendix I

Glossary

lease incentives

Payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee.

A lease agreement with a lessor might include incentives for the lessee to sign the lease, such as an upfront cash payment to the lessee, payment of costs for the lessee (such as moving expenses) or the assumption by the lessor of the lessee's pre-existing lease with a third party.

For lessees, lease incentives that are received by the lessee at or before the lease commencement date reduce the initial measurement of a lessee's right-of-use asset. [FRS 102.20.47(b)].

In some circumstances, a lease incentive may reduce the initial measurement of the right-of-use asset below zero. For example, this may occur if all the consideration is variable lease payments that do not depend on an index or rate, such as payments based on usage of the asset, and the lessee receives a lease incentive upfront, such as a cash payment from the lessor.

How we see it

We believe that when, as a result of the lease incentive, the initial measurement of the right-of-use asset is reduced to less than zero, the excess amount of the lease incentive is deferred and allocated over the lease term.

Paragraph 65 of Section 20, discussed at 6.4 below, relates to the remeasurement of a lease liability and the related adjustment to the previously recognised right-of-use asset. However, this paragraph applies to remeasurements after the commencement date, not to lease incentives at lease commencement.

Lease incentives that are receivable by the lessee at lease commencement date reduce a lessee's lease liability (and therefore, the right-of-use asset as well). *[FRS 102.20.51(a)].*

How we see it

We believe that lease incentives received or receivable at the date of a lease modification would also reduce the measurement of the right-of-use asset and the lease liability (if receivable) at the effective date of the modification.

For lessors, lease incentives that are paid or payable to the lessee are also deducted from lease payments and affect the lease classification test. For finance leases, lease incentives that are payable to the lessee reduce the expected lease receivables at the commencement date and, thereby, the initial measurement of the lessor's net investment in the lease. *[FRS 102.20.96(a)].* For operating leases, lessors should defer the cost of any lease incentives paid or payable to the lessee and recognise that cost as a reduction to lease income over the lease term (refer to 6 and 7 below, for lessees and lessors respectively).

5.5.3 Variable lease payments that depend on an index or rate

Variable lease payments that depend on an index or a rate include, for example, payments linked to a consumer price index (CPI), payments linked to a benchmark interest rate or payments that vary to reflect changes in market rental rates. *[FRS 102.20.53].* The payments are included in the lease payments for the purposes of determining the lease liability, and are measured using the prevailing index or rate at the measurement date (e.g., lease commencement date for initial measurement). *[FRS 102.20.54].*

A lessee remeasures the lease liability by discounting the revised lease payments if there is a change in future lease payments resulting from a change in an index or a rate used to determine those payments, including for example a change to reflect changes in market rental rates following a market rent review. The lessee remeasures the lease liability to reflect those revised lease payments only when there is a change in the cash flows (i.e., when the adjustment to the lease payments takes effect). A lessee determines the revised lease payments for the remainder of the lease term based on the revised contractual payments. *[FRS 102.20.68(b)].*

In applying paragraph 68 of Section 20, a lessee uses an unchanged discount rate, unless the change in lease payments results from a change in floating interest rates. In that case, the lessee uses a revised discount rate that reflects changes in the interest rate. *[FRS 102.20.69].*

Illustration 5-3: Variable lease payments that depend on an index or rate

Entity A enters into a 10-year lease of property. The lease payment for the first year is £1,000. The lease payments are linked to the consumer price index (CPI), i.e., not a floating interest rate. The CPI at the beginning of the first year is 100. Lease payments are updated at the end of every second year. At the end of year one, the CPI is 105. At the end of year two, the CPI is 108.

Analysis: At the lease commencement date, the lease payments are £1,000 per year for 10 years. Entity A does not take into consideration the potential future changes in the index. At the end of year one the payments have not changed, so the liability is not updated. At the end of year two, when the lease payments change, Entity A updates the remaining eight lease payments to £1,080 per year ($£1,000 \div 100 \times 108$) and does not change its discount rate to remeasure the lease liability (and right-of-use asset).

Lease contracts, particularly those relating to property, may include market rent reviews at future dates. The following Illustration shows how these clauses may be treated.

Illustration 5-4: Property leases with market rent reviews

Entity A enters into a 5-year lease of property. The lease payment for the first year is £1,000. In years 2 and 3, there is a fixed escalation of 4%. At the beginning of year 4, there is a market rent review that will determine the lease payment in years 4 and 5.

Analysis: The lease payments included in the lease liability and right-of-use asset at the lease commencement date are determined, as follows:

- Year 1 - £1,000
- Year 2 - £1,000 + 4% fixed escalation = £1,040
- Year 3 - £1,040 + 4% fixed escalation = £1,082

The market rent review applicable to years 4 and 5 is a variable lease payment that depends on an index or a rate (as described in FRS 102.20.53). Entity A assesses the market rent at commencement date for the lease of the property for a period of two years, which is the length of the remaining lease term. This is determined to be £1,035 per annum for years 4 and 5.

5.5.4 The exercise price of a purchase option

If the lessee is reasonably certain to exercise a purchase option, the exercise price is included as a lease payment. That is, entities consider the exercise price of asset purchase options included in lease contracts consistently with the evaluation of lease renewal and termination options (refer to 5.4 above).

5.5.5 Payments for penalties for terminating a lease

If it is reasonably certain that the lessee will not terminate a lease, the lease term is determined assuming that the termination option would not be exercised, and any termination penalty is excluded from the lease payments. Otherwise, the lease termination penalty is included as a lease payment. The determination of whether to include lease termination penalties as lease payments is similar to the evaluation of lease renewal options.

5.5.6 Amounts expected to be payable under residual value guarantees - lessees only

Section 20 requires lessees to include amounts expected to be payable to the lessor under residual value guarantees as lease payments.

A lessee may provide a guarantee to the lessor that the value of the underlying asset it returns to the lessor at the end of the lease will be at least a specified amount. Such guarantees are enforceable obligations that the lessee has assumed by entering into the lease. Uncertainty related to a lessee's guarantee of a lessor's residual value affects the measurement of the obligation rather than the existence of an obligation.

A lessee is required to remeasure the lease liability if there is a change in the amounts expected to be payable under a residual value guarantee (refer to 6.4 below). [FRS 102.20.68(a)].

Illustration 5-5: Residual value guarantee included in lease payments

Entity R (lessee) enters into a lease and guarantees that the lessor will realise £15,000 from selling the asset to another party at the end of the lease. At lease commencement, based on Entity R's estimate of the residual value of the underlying asset, Entity R determines that it expects that it will owe £6,000 at the end of the lease.

Analysis: Because it is expected that it will owe the lessor £6,000 under the residual value guarantee, Entity R includes that amount as a lease payment.

How we see it

Section 20 does not state how frequently reassessment should occur for expected changes under residual value guarantees. We would expect entities to apply judgement to determine the frequency of reassessment based on the relevant facts and circumstances.

5.5.7 Residual value guarantees - lessors only

Section 20 requires lessors to include in the lease payments any residual value guarantees provided to the lessor by the lessee, a party related to the lessee, or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. [FRS 102.20.96(c)]. This amount included in the lease payments is different from that for a lessee which only includes the amount expected to be payable (refer to 5.5.6 above).

5.5.8 Variable lease payments that do not depend on an index or rate

Variable lease payments that do not depend on an index or rate and are not in substance fixed (refer to 5.5.1 above), such as those based on performance (e.g., a percentage of sales) or usage of the underlying asset (e.g., the number of hours flown, the number of units produced), are not included as lease payments. Instead, they are recognised in profit or loss (unless they are included in the carrying amount of another asset in accordance with other applicable sections of FRS 102) in the period in which the event that triggers the payment occurs. [FRS 102.20.64(b)].

In some cases, the variability may be resolved during the lease term, so that payments become fixed for the remainder of the lease term. The new fixed payments are then used to remeasure the lease liability (with an offset to the right-of-use asset).

How we see it

In some cases, a contract specifies that when a contingency is resolved, the lessee is required to make an immediate catch-up payment. The catch-up payment relates specifically to the lessee's prior use of the asset. In this case, we believe, when the contingency is resolved, the catch-up obligation is recognised as part of the lease liability and is expensed immediately (rather than adjusting the right-of-use asset).

Illustration 5-6: Variable lease payments that do not depend on an index or rate

Entity A is a medical equipment manufacturer and a supplier of the related consumables. Customer B operates a medical centre. Under the agreement entered into by both parties, Entity A grants Customer B the right to use a medical laboratory machine at no cost and Customer B purchases consumables for use in the equipment from Entity A at £100 each. The consumables can only be used for that equipment and Customer B cannot use other consumables as substitutes. There is no minimum purchase amount required in the contract.

Based on its historical experience, Customer B estimates that it is highly likely to purchase at least 8,000 units of consumables annually. Customer B has appropriately assessed that the arrangement contains a lease of medical equipment. There are no residual value guarantees or other forms of consideration included in the contract.

Analysis: There are two components in the arrangement, a lease of equipment and the purchase of consumables.

Even though Customer B may believe that it is highly unlikely to purchase fewer than 8,000 units of consumables every year, in this example, there are no lease payments for purposes of initial measurement (Entity A and Customer B) and lease classification (Entity A).

Entity A and Customer B would allocate the payments associated with the future payments to the lease and consumables component of the contract.

Lease payments do not include payments allocated to the non-lease components of a contract. However, lease payments include amounts that would otherwise be allocable to the non-lease components (other than the purchase of goods) of a contract when the lessee makes an accounting policy election to account for the lease and non-lease components as a single lease component (refer to 4.2.2.B above).

5.5.9 Security deposits

At the commencement of a lease, a lessee may be required to pay a security deposit to the lessor. As long as the deposit is a true deposit and not a prepaid lease payment, the deposit gives the lessee a right to receive the money back in cash from the lessor and is, therefore, a financial asset for the lessee and a financial liability for the lessor.

The deposit may be accounted for in accordance with either Section 11 *Basic Financial Instruments* and Section 12 *Other Financial Instrument Issues* of FRS 102, IAS 39 *Financial Instruments: Recognition and Measurement* or IFRS 9 *Financial Instruments*, depending on the accounting policy choice made under paragraph 2 of Section 11 and Section 12 of FRS 102 (refer to Chapter 11). If an entity applies Section 11 and 12, it is likely that the deposit would meet the definition of a basic financial instrument and be accounted for under Section 11. Basic financial instruments within the scope of Section 11 will be initially measured at the transaction price, adjusted for transaction costs, except in the case of 'financing transactions'. A financing transaction is an arrangement for which payment is deferred beyond normal business terms or is financed at a rate of interest that is not a market rate. FRS 102 provides the example of a seller providing interest-free credit to a buyer for the sale of goods or an interest-free or below market interest rate loan made to an employee. Sections 11 and 12 require financing transactions to be initially measured at the present value of the future payments, discounted at a market rate of interest for a similar debt instrument as determined at initial recognition and adjusted for transaction costs.

If the entity applies IAS 39 or IFRS 9 the deposit must initially be accounted for at fair value. The fair value of the deposit is determined based on the prevailing market rate of interest for a similar loan to the lessor, considering the lessor's credit-worthiness and, depending on facts and circumstances, any additional security available to the lessee.

When the deposit earns interest below the market rate (and thus is expected to be a 'financing transaction' under Sections 11 and 12) the excess of the principal amount of the deposit over the present value of the future payments, discounted at a market rate of interest, is accounted for by both the lessee and lessor as a prepaid lease payment. It is therefore considered by the lessor in determining whether the lease is an operating or finance lease. The lessee includes this amount in the cost of its right-of-use asset at the lease commencement date. For the lessor, if the lease is classified as an operating lease, the prepaid lease payment is included in the total lease payments that are recognised as income on either a straight-line basis or another systematic basis, if that basis is more representative of the pattern in which benefit from the use of the underlying asset is diminished. If the lease is classified as a finance lease, the lessor includes the prepaid lease payment in the consideration for the lease (i.e., lease payments) and, therefore, in the determination of the gain or loss on derecognition of the underlying asset, if any.

Interest on the deposit is accounted for using the effective interest method by both the lessee and the lessor.

Illustration 5-7: Accounting for deposits paid by a lessee to a lessor

A lessee is required to pay a deposit of £100 to the lessor at lease commencement, for which no interest accrues to the lessee. The fixed lease term is 10 years. The market interest rate is 5% per annum (i.e., that is the interest rate the lessor would have to pay each year if it borrowed £100 for a 10-year term from a third party). The entity applies Section 11 and 12 in accounting for financial instruments.

Analysis:

Lessee accounting

At lease commencement:

Dr	Deposit receivable*	£61	
Dr	Right-of-use asset	£39	
	Cr Cash		£100

To record the deposit receivable at the present value of the future payments on initial recognition and to record the prepaid lease payment as part of the right-of-use asset. There is no impact on profit or loss at lease commencement.

* Deposit of £100 discounted at the market rate of interest (5% per annum) for the lease term of 10 years)

Year 1:

Dr	Deposit receivable#	£3	
	Cr Interest income		£3

To recognise interest income on the deposit using the effective interest method

Dr	Depreciation expenses	£4	
	Cr Right-of-use asset		£4

To depreciate over the ten-year lease term the additional rent included in the right-of-use asset

Estimated based on a 5% per annum effective interest rate

Lessor accounting in an operating lease*At lease commencement:*

Dr	Cash	£100	
	Cr	Deferred lease income	£39
	Cr	Deposit payable	£61

To record the deposit payable at the present value of the future payments on initial recognition and to record the prepaid lease payment as part of deferred lease income.

There is no impact on profit or loss at lease commencement.

Year 1:

Dr	Interest expense	£3	
	Cr	Deposit payable	£3

To recognise interest expense on the deposit using the effective interest method.

Dr	Deferred lease income	£4	
	Cr	Rental income	£4

To recognise the additional rent on a straight-line basis over the lease term

Lessor accounting in a finance lease

Assume the carrying amount of the underlying asset is £600; the initial carrying amount of the net investment in the lease (i.e., the present value of the lease payments not yet received at the commencement date) is £700; total lease payments including the effect of discounting the deposit is £739, and the present value of the unguaranteed residual value is £60.

At lease commencement:

Dr	Cash	£100	
Dr	Net investment in the lease	£760	
	Cr	Underlying asset	£600
	Cr	Deposit payable	£61
	Cr	Gain on disposal	£199

To recognise the lease transaction at commencement of the lease.

Year 1:

Dr	Interest expense	£3	
	Cr	Deposit payable	£3

To recognise interest expense on the deposit using the effective interest method. The additional journals to adjust the net investment in the lease for accrued interest and cash receipts have been excluded for simplicity.

5.5.10 Non-recoverable value added tax (VAT) and property taxes

When a lessee enters into a lease contract the lessor may be required to charge the lessee VAT in accordance with the local tax regulations. In many jurisdictions, the lessor charges VAT on behalf of the tax authority and payment is remitted to the tax authority. Additional background on VAT on UK based leases is provided below, but similar principles apply to non-recoverable VAT levied in other jurisdictions that operate in a similar manner.

Subject to registration thresholds, the supply of goods and services in the UK will be subject to UK VAT at the prevailing rate (i.e., standard rate, reduced rate, zero rate or exempt). An entity making taxable supplies is entitled to reclaim VAT they are charged on costs incurred for a business purpose (subject to further evidential/administrative conditions). Where a UK VAT registration obligation has been triggered, that entity will also be required to file VAT returns and maintain relevant VAT records. With regards to leases, different VAT rules apply to different types of leases. For example (non-exhaustive list):

- Residential property leases in the UK are typically exempt from VAT, which means lessors do not charge VAT on those leases, and the lessor is not eligible to reclaim VAT incurred on expenses directly attributable to those supplies.

- Similarly, commercial property leases in the UK are typically exempt from VAT (and the lessor is not eligible to reclaim VAT incurred on expenses directly attributable to those supplies), unless the lessor has opted to tax the property. By opting to tax the property all supplies made by the lessor of its interest in the property will be normally be subject to VAT at the standard rate, and in this case, the lessor is eligible to reclaim VAT incurred on expenses directly attributable to those supplies. There are special rules that apply which may mean the option to tax is disapplied depending on the parties involved.
- In contrast, VAT is typically charged (at the standard rate) on lease payments for leases of plant and equipment where the place of supply is the UK, and in this case, the lessor is eligible to reclaim VAT incurred on expenses directly attributable to those supplies.

Therefore, when a lessee enters into a lease contract, depending on the type of lease and the circumstances of the lessor, the lessor may be required to charge the lessee VAT and collect it on behalf of the HM Revenue and Customs ('HMRC'). Where a lessee has been charged VAT on a lease, the lessee needs to consider its own VAT position and whether it can reclaim VAT on the costs incurred. In some cases, due to the nature of a lessee's operations, the lessee may only be able to recover a portion of the VAT charged on purchased goods or services, which would include VAT payments made on leases. In these cases, the VAT paid (or a portion of the VAT paid) is non-refundable.

Section 20 of FRS 102 is silent on how irrecoverable VAT on leases should be accounted for. The key question is whether the irrecoverable VAT meets the definition of a lease payment and therefore included in the calculation of the lease liability. In the UK, whilst a lease agreement may require the lessee to make payments to the lessor which include VAT, the VAT is a tax which the lessor must collect and remit to HMRC. In circumstances such as this, the total payment made by the lessee to the lessor comprises two components. One component is a payment from the lessee to the lessor in exchange for the right to use the underlying asset (a lease payment), whilst the other component (the VAT component) is a levy to be remitted by the lessor to the tax authority. As a result, in our view, the VAT charged is not generally a lease payment. In addition, from a lessee's perspective, typically the lessee only incurs a liability for the VAT when the lessor invoices the lease payment. Therefore, the payments do not meet the definition of an initial direct cost as they are incurred as a consequence of using the asset during the lease term, not obligations that arise to obtain the lease. Therefore, we would typically expect entities to recognise a liability to make the VAT payments when they are invoiced.

How we see it

Generally, we expect that lessees will not include non-recoverable VAT in lease payments.

In the UK there are a number of taxes levied on property owners and occupiers, which may include stamp duty, capital gains tax when a property is sold, council tax (for residential property) and business rates (for commercial properties). For residential property, unless stated in the lease agreement, tenants are usually responsible for paying council tax, but there are some exceptions. Similarly, for commercial property the tenant is usually responsible for paying the business rates to the local authority, although there are instances where a landlord may take on the responsibility of paying business rates. This might be the case as a result of the specific terms in the lease, or for example, where there is a multi-let property and the landlord is responsible for common areas. As such, lessees of UK properties may often pay property taxes directly, but there may be instances in which the lessor is responsible for paying the rates.

Where the lessor is responsible for paying property taxes, the lease contract may specify that the lessee pays an additional amount to cover the lessor's property tax costs. Property tax that is reimbursable by the lessee to the lessor as the owner of the building, according to the contract, does not transfer any goods or services to the lessee and, as such, it is not a separate component of the contract. Rather, it is part of the total consideration and should be allocated to the separately identified components of the contract. If any portion of the reimbursable amount meets the definition of a lease payment (for example, because the lessee pays a fixed amount designed to cover the landlord's costs, or because although the cost is variable, the first-year tax reimbursement is known at lease commencement) it is included in the lease liability. If the reimbursable amount is variable and does not depend on an index or rate (for example, because it depends on the actual tax owed by the lessor as determined by the taxing authority each period) it is accounted for as a variable payment that does not depend on an index or rate as described in 5.5.8 above. Unlike the non-recoverable VAT payments discussed above, where it is the landlord who is obligated to pay the property tax, the property tax reimbursable by the lessee to the lessor is not a collection of tax by the lessor on behalf of the tax authority. The obligation to pay the property tax in those circumstances rests with the lessor (regardless of whether the lessee ends up making any payments to the lessor and the lessee's payment to the lessor simply compensates the lessor for the use of the building).

5.5.11 Co-tenancy clauses

A co-tenancy clause is a clause in a lease contract that could result in changes in a lessee's lease payments if certain events involving other tenants occur (e.g., if key tenants, or a certain number of tenants, leave a retail shopping centre). A co-tenancy clause, if triggered, may temporarily reduce a lessee's lease payments or contractually change the lease payments from fixed lease payments to variable lease payments (e.g., payments that were previously fixed are changed to a percentage of sales). Generally, when the co-tenancy clause is resolved (e.g., the anchor tenant is replaced or occupancy levels return to a stated percentage), the lease payments will revert to the previous amounts.

Section 20 requires a lessee to remeasure lease payments when a contingency, upon which some or all of the variable lease payments that will be paid over the remainder of the lease term are based, is resolved and those payments now meet the definition of lease payments. A co-tenancy clause would typically result in the inverse scenario because it would temporarily lower the lease payment or temporarily cause fixed payments to become variable.

How we see it

If after lease commencement, a co-tenancy clause is triggered, we believe a lessee generally would not remeasure the lease payments. We believe any temporary change in lease payments that results from a co-tenancy clause being triggered should be recognised in profit or loss similar to variable lease payments.

However, in certain circumstances, when it is likely the co-tenancy clause will not be resolved (e.g., the lease space is an ageing shopping centre with a low likelihood of locating replacement tenants that comply with the clause), we believe a lessee may reasonably conclude it should remeasure the lease payments.

In the example where the lease space is an ageing shopping centre with a low likelihood of locating replacement tenants that comply with the clause and the lessee concludes it should remeasure the lease payments, the lessee would reduce the existing lease liability with an adjustment to the right-of-use asset. The effect of a co-tenancy clause when reassessing lease payments will depend on facts and circumstances.

5.5.12 Reassessment of the lease liability

Section 20 contains specific requirements about how to remeasure the lease liability to reflect changes to the lease payments (refer to 6.4 below). A lessee recognises the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset. However, if the carrying amount of the right-of-use asset is reduced to zero and there is a further reduction in the measurement of the lease liability, a lessee recognises any remaining amount of the remeasurement in profit or loss. [FRS 102.20.65].

5.6 Discount rates

Extract from FRS 102

Appendix I

Glossary

interest rate implicit in the lease

The rate of interest that causes the present value of:

- (a) the lease payments and
- (b) the unguaranteed residual value to equal the sum of:
 - (i) the fair value of the underlying asset; and
 - (ii) any initial direct costs of the lessor.

lessee's incremental borrowing rate

The rate of interest that a lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment.

lessee's obtainable borrowing rate

The rate of interest that a lessee would have to pay to borrow over a similar term, an amount similar to the undiscounted value of the lease payments to be included in the measurement of the lease liability.

Discount rates are used to determine the present value of the lease payments, which are used to determine lease classification by lessors (refer to 7.1 below) and to measure a lessor's net investment in the lease and a lessee's lease liability.

For a lessor, the discount rate for the lease is the interest rate implicit in the lease, which is the rate that causes the following:

Initial direct costs, other than those incurred by manufacturer or dealer lessors, are included in the initial measurement of the net investment in the lease and reduce the amount of income recognised over the lease term (refer to 7.2 and 5.7 below).

For lessees, lease payments are discounted using the interest rate implicit in the lease as described above if that rate can be readily determined. If that rate cannot be readily determined, the lessee uses either:

- The lessee's incremental borrowing rate
- Or
- The lessee's obtainable borrowing rate

The lessee can choose whether to apply the incremental borrowing rate or the obtainable borrowing rate on a lease-by-lease basis, if the interest rate implicit in the lease cannot be readily determined. [FRS 102.20.49]. An additional simplification is available to public benefit entities that are unable readily to determine any of the three rates (refer to 5.6.3 below).

How we see it

The interest rate implicit in the lease is not necessarily the rate stated in the contract and reflects, among other things, the lessor's initial direct costs and estimates of residual value. Therefore, lessees may find it difficult to determine the interest rate implicit in the lease, in which case, they will need to determine either the incremental borrowing rate or the obtainable borrowing rate.

The term readily determinable is not equivalent to estimable. Therefore, when the interest rate implicit in the lease can only be determined by using estimates and/or assumptions, then the interest rate implicit in the lease is not readily determinable.

The lessee's incremental borrowing rate is the rate of interest that the lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment. [FRS 102 Appendix I].

In determining the incremental borrowing rate, the lessee considers borrowings with a similar term and security to the right-of-use asset, not the underlying asset. For example, in the case of a five-year property lease, the lessee considers borrowings with a similar term to the five year right-of-use asset, not the property itself, which may have a significantly longer life. Observable rates, such as a property yield can be used as a starting point to determine the incremental borrowing rate, but adjustments need to be considered for an asset with a value similar to the right-of-use asset. Other potential sources of adjustment may include the credit profile of the lessee, the borrowing currency, or the length of the lease term. It is likely that in some cases significant judgement will be needed to determine the incremental borrowing rate.

The lessee's obtainable borrowing rate is the rate of interest that the lessee would have to pay to borrow over a similar term, an amount similar to the undiscounted value of the lease payments to be included in the measurement of the lease liability. [FRS 102 Appendix I].

The concept of the 'obtainable borrowing rate' is unique to FRS 102 and therefore the option for lessees to use this rate is a difference between the requirements of Section 20 and those in IFRS 16. The obtainable borrowing rate represents a broadly similar concept to the incremental borrowing rate, but the FRC referred to it as a 'proportionate simplification', as it expects the lessee's obtainable borrowing rate to be simpler to determine. [FRS 102.B20.12(a)]. Similar to the incremental borrowing rate, in determining the obtainable borrowing rate the lessee considers borrowings with a similar term to the lease term. However, unlike the incremental borrowing rate, the obtainable borrowing rate only requires consideration of the rate at which the entity could borrow a similar monetary amount over the relevant term and not the wider considerations required in determining incremental borrowing rates, such as the nature or location of the

asset which would need to be captured when assessing similar security and economic environment. Again, observable rates can be used as a starting point to determine the obtainable borrowing rate, but appropriate adjustments need to be made (for example, to reflect the monetary amount and term of the lease).

How we see it

Market interest rates, particularly risk-free rates, can be negative. Section 20 does not contain a floor of zero for the discount rate and therefore it is possible that a lessee's incremental borrowing rate or obtainable borrowing rate could be below zero. However, as stated above, observable borrowings with negative nominal interest rates may be a starting point and entities will need to consider relevant sources of adjustment to determine its own incremental or obtainable borrowing rate.

In certain cases, particularly for high value assets, the incremental borrowing rate or obtainable borrowing rate may be lower than the lessee would expect the lessor's interest rate implicit in the lease to be, because the lessor is exposed to the residual value risk of the asset at the end of the lease term. This asset risk premium is not adjusted for as it does not meet the definition of the incremental or obtainable borrowing rate in Section 20.

As explained above, the lessee's incremental borrowing rate reflects the rate of interest that a lessee would have to pay, taking into account various factors including the economic environment. This is generally a nominal discount rate. If the contract requires lease payments to be made in a currency other than the functional currency of the lessee, the incremental borrowing rate of the lessee should be determined based on a borrowing of a similar amount in that foreign currency. Leases denominated in a foreign currency are discussed further in 6.6.2 below. The requirement to reflect the rate of interest that a lessee would have to pay in a similar economic environment is not a feature of the definition of obtainable borrowing rate, and therefore this is an area in which determining the obtainable borrowing rate may be simpler than determining incremental borrowing rate. Entities must nonetheless be mindful of the general requirements of FRS 102's Conceptual Framework, including the fundamental qualitative characteristics of relevance (including materiality) and faithful representation. [FRS 102.2.9, FRS 102.2.12]. Therefore, it may be necessary to consider other factors in determining OBR, if failure to do so could result in the use of an inappropriate discount rate. An example of an inappropriate rate might be application of a Turkish Lira discount rate to a lease denominated in Pounds Sterling.

One question which may arise is whether a lessee's incremental or obtainable borrowing rate is required to reflect the interest rate on a loan with both a similar maturity to the lease and a similar payment profile to the lease. Specifically, whether an entity should use the interest rate for an amortising loan (whereby the principal and interest are paid down over time) or the interest rate for a bullet repayment loan, (whereby the interest is paid over time with a single bullet payment of the principal at the end of the loan). Interest rates for bullet repayment loans are often higher than those for amortising loans.

The definition of a lessee's incremental or obtainable borrowing rate in Section 20 does not explicitly require a lessee to determine its incremental or obtainable borrowing rate to reflect the interest rate on a loan with a similar payment profile to the lease payments. However, a similar question was considered by the IFRS IC in respect of the determination of incremental borrowing rate for IFRS reporting entities, and the Committee noted that it would be consistent with the IASB's objective (when developing the definition of incremental borrowing rate) for a lessee to refer, as a starting point, to a readily observable rate for a loan with a similar payment profile to that of the lease.

How we see it

Given the lack of prescriptive guidance, we believe that the use of an amortising loan rate that has a similar payment profile to the lease is always acceptable. The use of other rates (e.g., bullet loan rates) may also be acceptable depending on the facts and circumstances (e.g., when the use of such rates aligns with the lessee's normal borrowing practices).

5.6.1 Determination of the incremental or obtainable borrowing rate by a subsidiary with centralised treasury functions

Some groups maintain centralised treasury functions and all funding requirements for the group are managed by the parent entity. Under Section 20, subsidiaries participating in a centralised treasury function cannot default to their parent's incremental or obtainable borrowing rate. Rather, all facts and circumstances should be considered to determine the subsidiary/lessee's incremental or obtainable borrowing rate. The existence of guarantees of the subsidiary's obligations may result in a rate that is similar to the parent's rate as if the parent had entered into the lease directly.

5.6.2 Reassessment of the discount rate

The discount rate for a lessee is reassessed in the following situations:

- A change in the lease term.
- A change in the assessment of an option to purchase the underlying asset.
- A modification that is not accounted for as a separate lease and does not meet any of the conditions set out in paragraph 72 of Section 20 (see below).
- A change in lease payments resulting from a change in floating interest rates.

For a lease modification that is not accounted for as a separate lease, the lessee is required to remeasure the lease liability by discounting the revised lease payments using a revised discount rate, except when any of the following conditions are met, in which case the lessee may use an unchanged discount rate:

- The additional consideration from the lease modification is insignificant to the total consideration of the original lease.
- The lease modification decreases the scope of the lease by removing the right to use one or more underlying assets, and the consideration for the lease decreases by an amount commensurate with the stand-alone price for the decrease in scope.

Or

- The lease modification decreases the consideration payable for the remaining term of the lease, but does not decrease the scope of the lease by removing the right to use one or more underlying assets.

Refer to 5.5.12 above and 6.5 below.

An additional simplification is available to public benefit entities (refer to 5.6.3 below).

Section 20 does not include specific requirements on the reassessment of the discount rate for lessors.

5.6.3 Public benefit entities - additional simplification

Section 20 provides an additional simplification for public benefit entities in respect of determining the discount rate. This option sets out that if a public benefit entity is unable to readily determine either the interest rate implicit in the lease, the incremental or obtainable borrowing rate for a lease, it uses the rate of interest otherwise obtainable by the public benefit entity on deposits held with financial institutions. This additional simplification was provided on the basis that some public benefit entities are not able to borrow.

[FRS 102.PBE20.50].

5.7 Initial direct costs

Extract from FRS 102

Appendix I

initial direct costs

Incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained, except for such costs incurred by a manufacturer or dealer lessor in connection with a finance lease.

Under Section 20, initial direct costs are incremental costs that would not have been incurred if the lease had not been obtained (e.g., commissions, certain payments made to an existing lessee to incentivise that lessee to terminate its lease). Lessees and lessors apply the same definition of initial direct costs.

5.7.1 Lessor accounting for initial direct costs

Section 20 requires lessors, other than manufacturer or dealer lessors, to include initial direct costs in the initial measurement of their net investments in finance leases and reduce the amount of income recognised over the lease term. The interest rate implicit in the lease is defined in such a way that the initial direct costs are included automatically in the net investment in the lease and they are not added separately. Initial direct costs related to finance leases incurred by manufacturer or dealer lessors are expensed at lease commencement. [FRS 102.20.95].

Section 20 requires lessors to include initial direct costs in the carrying amount of the underlying asset in an operating lease. These initial direct costs are recognised as an expense over the lease term on the same basis as lease income. [FRS 102.20.108].

5.7.2 Lessee accounting for initial direct costs

Section 20 requires lessees to include their initial direct costs in their initial measurement of the right-of-use asset.

Certain costs associated with acquiring an asset within the scope of Section 17 are required to be capitalised upon initial recognition (refer to Chapter 20 at 3.4.1.A). However, Section 20 does not address the accounting for costs incurred by lessees that are directly attributable to bringing a right-of-use asset to the location and condition necessary for it to be capable of operating in the manner intended by management.

How we see it

To the extent that costs related to acquiring a right-of-use asset are not subject to capitalisation under other sections of FRS 102 (e.g., Section 17), it remains to be seen in practice whether they are charged to profit or loss when incurred or capitalised by analogy to Section 17. For example, a lessee may incur costs when leasing an asset, by paying a third party to ship the asset, prepare the site and install the underlying asset. We believe lessees may analogise to Section 17 to determine if such costs can be capitalised.

5.8 Economic life

Section 20 sets out examples of situations that individually or in combination would normally lead to a lease being classified by a lessor as a finance lease. One of the examples is that "...the lease term is for the major part of the economic life of the underlying asset even if title is not transferred". [FRS 102.20.88(c)]. However, neither Section 20 nor the FRS 102 Glossary define the term 'economic life'. Entities may wish to refer to the definition provided in Appendix A to IFRS 16, which defines economic life as "Either the period over which an asset is expected to be economically usable by one or more users or the number of production or similar units expected to be obtained from an asset by one or more users." [IFRS 16.Appendix A].

5.9 Fair value

Extract from FRS 102

20.4 Except in the scope of references to Section 16 *Investment Property*, this section uses the term 'fair value' in a way that differs in some respects from the definition of fair value in Appendix I Glossary. For the purposes of applying the lessor accounting requirements in this section, fair value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. [FRS 102.20.4]

6 Requirements of Section 20 for leases: Lessee accounting

6.1 Initial recognition

At the commencement date, a lessee recognises a right-of-use asset and a lease liability. [FRS 102.20.45].

Section 20 requires lessees to recognise a liability to make lease payments and an asset representing the right to use the underlying asset (i.e., the right-of-use asset) during the lease term for all leases, except for short-term leases (refer to 6.1.1 below) and leases of low-value assets (refer to 6.1.2 below) if they choose to apply such exemptions. [FRS 102.20.5].

6.1.1 Short-term leases

A short-term lease is defined as a lease that, at the commencement date, has a lease term of 12 months or less. A lease that contains a purchase option is not a short-term lease. [FRS 102 Appendix I].

The short-term lease exemption can be made by class of underlying asset to which the right of use relates. [FRS 102.20.7]. A class of underlying asset is a grouping of underlying assets of a similar nature and use in an entity's operations. [FRS 102 Appendix I].

A lessee that makes this accounting policy election does not recognise a lease liability or right-of-use asset on its statement of financial position. Instead, the lessee recognises the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis. The lessee is required to apply another systematic basis if that basis is more representative of the pattern of the lessee's benefit. [FRS 102.20.6].

When determining whether a lease qualifies as a short-term lease, a lessee evaluates the lease term in the same manner as all other leases (refer to 5.4 above). That is, the lease term includes the non-cancellable term of the lease, periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option, and periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option. [FRS 102.20.38]. As the determination is made at commencement date, a lease cannot be classified as short-term if the lease term is subsequently reduced to less than 12 months. In addition, to qualify as a short-term lease, the lease cannot include an option to purchase the underlying asset.

A lease that at commencement qualified as a short-term lease is considered to be a new lease if there is a lease modification or a change in a lessee's assessment of the lease term (e.g., the lessee exercises an option not previously included in the determination of the lease term). [FRS 102.20.8]. The new lease is evaluated to determine whether it qualifies for the short-term exemption, similar to any other new lease.

A lessee that makes the short-term lease accounting policy election must provide certain quantitative and qualitative disclosures about short-term leases (refer to 6.8 below).

Once a lessee establishes a policy for a class of underlying assets, all future short-term leases for that class are required to be accounted for in accordance with the lessee's policy. A lessee evaluates any potential change in its accounting policy in accordance with Section 10.

Illustration 6-1: Short-term lease

Scenario A

A lessee enters into a lease with a nine-month non-cancellable term with an option to extend the lease for four months. The lease does not have a purchase option. At the lease commencement date, the lessee concludes that it is reasonably certain to exercise the extension option because the monthly lease payments during the extension period are significantly below market rates.

Analysis: The lease term is greater than 12 months (i.e., 13 months). Therefore, the lessee may not account for the lease as a short-term lease.

Scenario B

Assume the same facts as Scenario A except, at the lease commencement date, the lessee concludes that it is not reasonably certain to exercise the extension option because the monthly lease payments during the optional extension period are at what the lessee expects to be market rates and there are no other factors that would make exercise of the renewal option reasonably certain.

Analysis: The lease term is 12 months or less, i.e., nine months. Therefore, the lessee may (subject to its accounting policy, by class of underlying asset) account for the lease under the short-term lease exemption, i.e., it recognises lease payments as an expense on either a straight-line basis over the lease term or another systematic basis and does not recognise a lease liability or right-of-use asset on its statement of financial position.

6.1.2 Leases of low-value assets

Lessees can also make an election for leases for which the underlying asset is of low value (i.e., low-value assets). This election can be made on a lease-by-lease basis. [FRS 102.20.7.8]. A lessee that makes this election does not recognise a lease liability or right-of-use asset on its statement of financial position. Instead, the lessee recognises the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis, if that basis is more representative of the pattern of the lessee's benefit. [FRS 102.20.6].

The assessment of whether an underlying asset is of low value is performed on an absolute basis. Leases of low-value assets qualify for the exemption regardless of whether those leases are material to the lessee. The assessment is not affected by the size, nature or circumstances of the lessee. The value of lease payments has no bearing on the assessment of whether an underlying asset is of low value. [FRS 102.20.9]. There is no limit to the number of individual assets that can be considered as low-value for the purpose of the recognition exemption.

An underlying asset can only be of low-value only if:

- The lessee can benefit from use of the underlying asset on its own, or together with other resources that are readily available to the lessee.

And

- The underlying asset is not highly dependent on, or highly interrelated with, other assets. [FRS 102.20.10].

For example, an entity may lease a truck for use in its business and the lease includes the use of the tyres attached to the truck. To use the tyres for their intended purpose, they can only be used with the truck and as such, they are dependent on, or highly interrelated with the truck. Therefore, the tyres would not qualify for the low-value asset exemption.

Examples of underlying assets that would not be of low value include:

- Cars, vans, buses, coaches, trams, trucks and lorries
- Cranes, excavators, loaders and bulldozers
- Telehandlers and forklifts
- Tractors, harvesters and related attachments
- Boats and ships
- Railway rolling stock
- Aircraft and aero engines
- Land and buildings
- Production line equipment [FRS 102.20.11]

The list is not exhaustive and the FRC in FRS 102 Factsheet 11 *Lease accounting for lessees*¹⁰⁸, note that entities need to consider whether a leased asset is of similar value to those on this list.

Section 20 focuses on highlighting examples of assets which are not of low value and does not provide examples of low-value assets. As discussed at 2.5 above, this differs from IFRS 16 which states that examples of low-value assets can include tablet and personal computers, small items of office furniture and telephones. Application of the recognition exemption to, at least, leases of such assets under Section 20 would be acceptable. [FRS 102.B20.10]. The FRC expects that, as a result of this greater flexibility in defining low-value assets, FRS 102 preparers will be able to apply the on-balance sheet lease accounting model to a smaller proportion of their leases, substantively reducing the impact of applying this new model.

[FRS 102.B20.11].

An intermediate lessor who subleases, or expects to sublease an asset, cannot account for the head lease as a lease of a low-value asset (refer to 8 below). [FRS 102.20.12].

108 FRC FRS 102 factsheet 9 Initial application of the Periodic Review 2024 amendments (November 2024)

6.2 Initial measurement

6.2.1 Right-of-use assets

At the lease commencement date, a lessee measures the right-of-use asset at cost, which consists of all of the following:

- The amount of the initial measurement of the lease liability (refer to 6.2.2 below).
- Any lease payments made to the lessor at or before the commencement date, less any lease incentives received from the lessor (refer to 5.5.2 above).
- Any initial direct costs incurred by the lessee (refer to 5.7.2 above).
- Any amount recognised in accordance with Section 21 at the commencement date as an estimate of the costs to be incurred by the lessee in dismantling and removing the underlying asset, restoring the site on which the underlying asset is located or restoring the underlying asset to the condition required by the terms and conditions of the lease, unless those costs are incurred to produce inventories.
- Any amount recognised at the commencement date in accordance with Section 24 (refer to Chapter 26 at 6.2), or for a public benefit entity, paragraphs PBE34.64 to PBE34.74 (refer to Chapter 36 at 6.4), when a lease component contains a government grant or non-exchange transaction. [FRS 102.20.35, FRS 102.20.46, FRS 102.20.47].

On initial measurement, a lessee is required to recognise dismantling, removal and restoration costs as part of the right-of-use asset. Costs may be incurred at lease commencement or during a particular period as a consequence of having used an underlying asset. Costs that are incurred during a particular period as a consequence of having used the right-of-use asset to produce inventories are accounted for under Section 13 *Inventories*. The liability associated with dismantling, removal and restoration costs is recognised and measured in accordance with Section 21. [FRS 102.20.48].

In practice, some arrangements may contain both a lease and a non-exchange component. This may be the case, for example, if a lessor chooses to accept lower rent for the philanthropic intention of providing a benefit to a public benefit entity. A government grant could also be provided in the form of a lease at below-market rates; in this case the lessee may or may not be a public benefit entity. However, other situations which at face value might appear to be 'below market' would not indicate a non-exchange component, for example if a lessor discounted the rentals on a retail premises for the primary reason of keeping the premises occupied, regardless of whether or not the lessee was a public benefit entity. [FRS 102.B20.15].

As discussed at 2.3 above, Section 20 requires a lessee to use the information readily available to it to identify whether a lease contains a non-exchange component. The FRC expects that such situations may not be common in practice. When such a non-exchange component is identified, the lessee is required to account for the incoming resources in accordance with the requirements of Section 34, recognising the income as a contribution to the cost of the right-of-use asset. This represents that, because of the non-exchange component, the value of the right-of-use asset will be higher than the contractual lease payments would imply. [FRS 102.B20.16]. The same logic would also be relevant where a government grant is provided in the form of a lease at below-market rates to a lessee who may or may not be a public benefit entity.

In certain retail property leases, a lessee may sign a lease contract with a lessor and also make a payment to the existing lessee in return for vacating the property. This is sometimes referred to as key money. The existing lessee is released from all obligations under the lease contract with the lessor (i.e., this is not a sublease arrangement). The new lessee also has the right to transfer its rights and obligations in the lease contract to another party in exchange for payment, which would also release the new lessee from all obligations with the lessor. On initial recognition of the lease contract, the payment to the previous lessee is accounted for as an initial direct cost (refer to 5.7.2 above) and is therefore included in the measurement of the right-of-use asset. The payment is not in the scope of Section 18. The new lessee applies the requirements described in 6.3.1 below to the subsequent measurement of the right-of-use asset.

6.2.2 Lease liabilities

Extract from FRS 102

- 20.49** At the commencement date, a lessee shall measure the lease liability at the present value of the lease payments that are not paid at that date. The lease payments shall be discounted using the interest rate implicit in the lease, if that rate can be readily determined. If that rate cannot be readily determined, the lessee shall choose, on a lease-by-lease basis, to apply either the lessee's incremental borrowing rate or the lessee's obtainable borrowing rate. [FRS 102.20.49]

At the commencement date, a lessee initially measures the lease liability at the present value of the lease payments to be made over the lease term. Lessees apply the concepts previously described in 4.2 and 5 above to identify the lease components and to determine the lease term, lease payments and discount rate as of the commencement date of the lease. [FRS 102.20.49, FRS 102.20.51].

Illustration 6-2 below, based on Examples 3a to 3d from the FRC's FRS 102 Factsheet 11 *Lease accounting for lessees*, reflects how the various payments a lessee may be required to make under the terms of a lease are reflected in the measurement of the lease liability.

Illustration 6-2: Lease payments to be reflected in measurement of the lease liability

Scenario A

A lessee enters into a five-year property lease on 1 January 20X6, with annual lease payments of £10,000 (paid in advance), a six-month rent-free period, and a cash lease incentive of £3,000 received at the start of the lease (as opposed to receivable in the future). The lease also includes an additional turnover rent, payable in arrears, of 5% of the sales made by the lessee using the leased property.

The lease payments to be reflected in the calculation of the lease liability are as follows:

Date	Lease payment £
1 July 20X6	5,000
1 January 20X7	10,000
1 January 20X8	10,000
1 January 20X9	10,000
1 January 20Y0	10,000

The turnover rent is a variable lease payment that does not depend on an index or rate, and is therefore not included in the measurement of the lease liability.

The cash incentive of £3,000 is not included in the calculation of the lease liability, but is deducted from the cost of the right-of-use asset. [FRS 102.20.47(b)]. The benefit of the lease incentive is therefore recognised as reduced depreciation of the right-of-use asset.

Scenario B

A lessee enters into a three-year lease for a lorry, with monthly lease payments of £1,000 structured as a £10 fixed payment and a £990 variable payment that becomes due if the lorry is proven to be capable of being driven at any point during the lease term.

Whilst, in form, this payment is variable, it is judged that it has no genuine possibility of not occurring, and so constitutes an in-substance fixed lease payment, and is included in the measurement of the lease liability (refer to 5.5.1 above).

Scenario C

A lease contract states that the lease payment, which is set initially at a market level, will increase every third year to align to market increases in rent. This is an example of a variable lease payment that depends on an index or rate. [FRS 102.20.53].

The initial measurement of the lease liability does not include any amount in respect of the future market rent adjustment. The lease liability is measured initially using the index or rate at the commencement date [FRS 102.20.51(b)], and so reflects the initial market-based lease payment, but does not reflect, or contain any, assumptions about, changes to the index or rate after that date (refer to 5.5.3 above). [FRS 102.20.54].

Subsequently, the lease liability is remeasured, in line with paragraph 68(b) of Section 20, when there is a change in the cash flows resulting from a change in an index or rate. A corresponding adjustment is made to the right-of-use asset, in line with paragraph 56(b) of Section 20 (refer to 6.4 below).

Scenario D

A lessee signs a ten-year lease with annual payments of £10,000 and a break clause at five years, accompanied by a £5,000 penalty if exercised. It assesses that it is reasonably certain not to exercise the break clause; therefore the lease term is ten years and the total lease payments are £100,000.

Illustration 6-3 below, based on Example 4 from the FRC FRS 102 Factsheet 11, reflects how a lessee initially measures the lease liability at the present value of the lease payments to be made over the lease term.

Illustration 6-3: Measurement of the lease liability

A lessee enters into a five-year property lease on 1 January 20X6, with annual lease payments of £10,000 (paid in arrears).

The lessee concludes that it cannot readily determine the interest rate implicit in the lease. It chooses to determine its obtainable borrowing rate instead, taking into account a quote from its bank to borrow £50,000 over a similar term, it concludes that the obtainable borrowing rate is 7%.

The table below sets out the undiscounted and discounted cash flows:

Date	Lease payment	Discount factor	Discounted amount
	£		£
31 December 20X6	10,000	1.070	9,346
31 December 20X7	10,000	1.145	8,734
31 December 20X8	10,000	1.225	8,163
31 December 20X9	10,000	1.311	7,629
31 December 20Y0	10,000	1.403	7,130
	<u>50,000</u>		<u>41,002</u>

The lessee therefore recognises a lease liability of £41,002 at the commencement date.

6.3 Subsequent measurement

6.3.1 Right-of-use assets

A lessee subsequently measures the right-of-use asset using a cost model, unless it applies one of the other measurement models discussed in 6.3.1.B below. [FRS 102.20.55].

6.3.1.A Cost model

To apply the cost model, a lessee measures the right-of-use asset at cost:

- Less any accumulated depreciation and any accumulated impairment losses.
- And
- Adjusted for any remeasurement of the lease liability described in 6.4 below. [FRS 102.20.56].

A lessee applies the depreciation requirements in Section 17 in depreciating the right-of-use asset [FRS 102.20.57], subject to the following requirements:

If the lease transfers ownership of the underlying asset to the lessee by the end of the lease term, or if the cost of the right-of-use asset reflects that the lessee will exercise a purchase option, the lessee depreciates the right-of-use asset from the commencement date to the end of the useful life of the underlying asset. Otherwise, the lessee depreciates the right-of-use asset from the commencement date to the earlier of the end of the useful life of the right-of-use asset or the end of the lease term. [FRS 102.20.58]. The leased asset is depreciated from the commencement date of the lease even if the lessee chooses not to use the asset from the commencement date, for example, because leasehold improvements are being constructed.

Depreciation of the right-of-use asset is recognised in a manner consistent with existing requirements for property, plant and equipment. Section 17 is not prescriptive about the methods of depreciation, mentioning straight line, diminishing balance and units of production as possibilities. The overriding requirement of Section 17 is that the depreciation charge reflects the pattern of consumption of the benefits the asset brings over its useful life.

Section 17 also requires that if major components of an item of property, plant and equipment have significantly different patterns of consumptions of economic benefits, an entity allocates the amount initially recognised with respect to an item of property, plant and equipment to its major components and separately depreciates each such part. [FRS 102.17.16]. In many cases, the right-of-use asset will relate to one underlying asset or significant part and so a component approach may not be necessary. However, entities will need to assess whether it should be applied for right-of-use assets that have significant parts with different useful economic lives.

A lessee applies Section 27 *Impairment of Assets* to determine whether the right-of-use asset is impaired and to account for any impairment loss identified. [FRS 102.20.59].

6.3.1.B Other measurement models

A lessee applies the fair value model in Section 16 to right-of-use assets that meet the definition of investment property unless the investment property is rented to another group entity and chooses to account for the property by transferring them to right-of-use assets and applying the cost model.

[FRS 102.20.60].

If right-of-use assets relate to a class of property, plant and equipment to which the lessee applies the revaluation model in Section 17, the lessee may elect to apply that revaluation model to all the right-of-use assets that relate to that class of property, plant and equipment. [FRS 102.20.61].

6.3.2 Lease liabilities

Extract from FRS 102

20.62 After the commencement date, a lessee shall measure the lease liability by:

- (a) increasing the carrying amount to reflect interest on the lease liability;
- (b) reducing the carrying amount to reflect the lease payments made; and
- (c) remeasuring the carrying amount to reflect any reassessment (as set out in paragraphs 20.65 to 20.69) or lease modifications (as set out in paragraphs 20.70 to 20.73), or to reflect revised in-substance fixed lease payments (see paragraph 20.52).

[FRS 102.20.62]

Interest on the lease liability in each period during the lease term, is the amount that produces a constant periodic rate of interest on the remaining balance of the lease liability. The periodic rate of interest is the discount rate determined at commencement unless a reassessment requiring a change in the discount rate or lease modification has been triggered (refer to 6.4 and 6.5 below). [FRS 102.20.63].

Illustration 6-4 below, based on Example 5 from the FRC FRS 102 Factsheet 11, reflects how a lease liability is accounted for subsequent to initial recognition.

Illustration 6-4: Subsequent measurement of the lease liability

Based on the fact pattern in Illustration 6-3 above, a table can be constructed showing how the lease liability unwinds over the lease term. The interest expense is equal to the interest rate (7%) multiplied by the opening balance for the period.

The table below sets out how the lease liability unwinds over the lease term.

Date	Opening balance	Lease payment	Interest expense	Closing balance
	£	£	£	£
31 December 20X6	41,002	(10,000)	2,870	33,872
31 December 20X7	33,872	(10,000)	2,371	26,243
31 December 20X8	26,243	(10,000)	1,837	18,080
31 December 20X9	18,080	(10,000)	1,266	9,346
31 December 20Y0	9,346	(10,000)	654	0
		(50,000)	8,998	

In respect of the right-of-use asset, the initial balance would also be £41,002 (assuming no other adjustments to be made in line with paragraph 47 of Section 20 (refer to 6.2.1 above), which would typically be depreciated on a straight-line basis over the five-year lease term.

The total expense recognised in profit or loss is therefore interest of £8,998 plus depreciation of £41,002, which equals the total cash flows of £50,000.

In practice, discounting can be done in spreadsheets using a line-by-line approach for each period or one of the inbuilt formulae. However, care will need to be taken to ensure that appropriate formulae are applied to appropriate inputs.

6.3.3 Expense recognition

After the commencement date, the lessee recognises depreciation and impairment of the right-of-use asset in profit or loss, unless depreciation is permitted to be capitalised (e.g., to inventory) under other sections of FRS 102 (or the lessee applies the fair value model described in 6.3.1.B above).

A lessee also recognises in profit or loss, unless the costs are included in the carrying amount of another asset applying other sections of FRS 102, both:

- Interest on the lease liability.
- And
- Variable lease payments not included in the measurement of the lease liability in the period in which the event or condition that triggers those payments occurs. [FRS 102.20.64].

When a lessee depreciates the right-of-use asset on a straight-line basis, the total periodic expense (i.e., the sum of interest and depreciation expense) is generally higher in the early periods and lower in the later periods. Because a constant interest rate is applied to the lease liability, interest expense decreases as cash payments are made during the lease term and the lease liability decreases. Therefore, more interest expense is incurred in the early periods and less in the later periods. This trend in the interest expense, combined with straight-line depreciation of the right-of-use asset, results in a front-loaded expense recognition pattern. This can be seen in Illustration 6-5 below.

If a lessee determines that a right-of-use asset is impaired, it recognises an impairment loss and measures the right-of-use asset at its carrying amount immediately after the impairment. A lessee subsequently depreciates, generally on a straight-line basis, the right-of-use asset from the date of the impairment to the earlier of the end of the useful life of the right-of-use asset or the end of the lease term. However, the depreciation period is the remaining useful life of the underlying asset if the lessee is reasonably certain to exercise an option to purchase the underlying asset or if the lease transfers ownership of the underlying asset to the lessee by the end of the lease term. Refer to 6.6.1 below for additional discussion of impairment of right-of-use assets.

6.3.4 Example - lessee accounting

Illustration 6-5: Lessee accounting

Entity H (lessee) enters into a three-year lease of equipment. Entity H agrees to make the following annual payments at the end of each year: £10,000 in year one, £12,000 in year two and £14,000 in year three. For simplicity, there are no other elements to the lease payments (e.g., purchase options, lease incentives from the lessor or initial direct costs). The initial measurement of the right-of-use asset and lease liability is £33,000 (present value of lease payments using a discount rate of approximately 4.235%). The interest rate implicit in the lease cannot be readily determined, and Entity H chooses to use its incremental borrowing rate rather than its obtainable borrowing rate. Entity H depreciates the right-of-use asset on a straight-line basis over the lease term.

Analysis:

At lease commencement, Entity H would recognise the lease-related asset and liability:

Dr	Right-of-use asset	£33,000	
	Cr	Lease liability	£33,000

To initially recognise the lease-related asset and liability

The following journal entries would be recorded in the first year:

Dr	Interest expense	£1,398	
	Cr	Lease liability	£1,398

To record interest expense and accrete the lease liability using the interest method (£33,000 × 4.235%)

Dr	Depreciation expense	£11,000	
	Cr	Right-of-use asset	£11,000

To record depreciation expense on the right-of-use asset (£33,000 ÷ 3 years)

Dr	Lease liability	£10,000	
	Cr	Cash	£10,000

To record lease payment

A summary of the accounting for the lease contract (assuming no changes due to reassessment) is, as follows:

	Initial	Year 1	Year 2	Year 3
Cash lease payments		£10,000	£12,000	£14,000
<i>Lease expense recognised</i>				
Interest expense		£1,398	£1,033	£569
Depreciation expense		£11,000	£11,000	£11,000
Total periodic expense		£12,398	£12,033	£11,569
<i>Statement of financial position</i>				
Right-of-use asset	£33,000	£22,000	£11,000	-
Lease liability	(£33,000)	(£24,398)	(£13,431)	-

6.4 Remeasurement of lease liabilities

Extract from FRS 102

- 20.65** After the commencement date, a lessee shall apply paragraphs 20.66 to 20.69 to remeasure the lease liability to reflect changes to the lease payments. A lessee shall recognise the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset. However, if the carrying amount of the right-of-use asset is reduced to zero and there is a further reduction in the measurement of the lease liability, a lessee shall recognise any remaining amount of the remeasurement in profit or loss.
- 20.66** A lessee shall remeasure the lease liability by discounting the revised lease payments using a revised discount rate, if either:
- (a) there is a change in the lease term, as described in paragraphs 20.43 to 20.44. A lessee shall determine the revised lease payments on the basis of the revised lease term; or
 - (b) there is a change in the assessment of an option to purchase the underlying asset, assessed considering the events and circumstances described in paragraphs 20.43 to 20.44 in the context of a purchase option. A lessee shall determine the revised lease payments to reflect the change in amounts payable under the purchase option.
- 20.67** In applying paragraph 20.66, a lessee shall determine the revised discount rate as the interest rate implicit in the lease for the remainder of the lease term. If that rate cannot be readily determined, the lessee shall use either the lessee's incremental borrowing rate or the lessee's obtainable borrowing rate at the date of reassessment. When applicable, a public benefit entity shall apply paragraph PBE20.50.
- 20.68** A lessee shall remeasure the lease liability by discounting the revised lease payments, if either:
- (a) there is a change in the amounts expected to be payable under a residual value guarantee. A lessee shall determine the revised lease payments to reflect the change in amounts expected to be payable under the residual value guarantee; or
 - (b) there is a change in future lease payments resulting from a change in an index or a rate used to determine those payments, including for example a change to reflect changes in market rental rates following a market rent review. The lessee shall remeasure the lease liability to reflect those revised lease payments only when there is a change in the cash flows (ie when the adjustment to the lease payments takes effect). A lessee shall determine the revised lease payments for the remainder of the lease term based on the revised contractual payments.
- 20.69** In applying paragraph 20.68, a lessee shall use an unchanged discount rate, unless the change in lease payments results from a change in floating interest rates. In that case, the lessee shall use a revised discount rate that reflects changes in the interest rate.

Section 20 requires lessees to remeasure lease liabilities when there is a lease modification (i.e., a change in the scope of a lease, or the consideration for a lease that was not part of the original terms and conditions of the lease) that is not accounted for as a separate contract (refer to 6.5 below). Lessees are also required to remeasure lease payments upon a change in any of the following:

- The lease term (refer to 5.4.2.A above).
- The assessment of whether the lessee is reasonably certain to exercise an option to purchase the underlying asset (refer to 5.4.2.A above).
- The amounts expected to be payable under residual value guarantees (refer to 5.5.6 above).
- Future lease payments resulting from a change in an index or rate (refer to 5.5.3 above).

Or

- In-substance fixed lease payments (refer to 5.5.1 above).

Lessees use a revised discount rate when lease payments are updated for a change in the lease term or a revised assessment of a purchase option, [FRS 102.20.66], i.e., when there is a change in the underlying economics of the lease¹⁰⁹. The revised discount rate is based on the interest rate implicit in the lease for the remainder of the lease term. If that rate cannot be readily determined, the lessee uses either its incremental borrowing rate or obtainable borrowing rate. A lessee that is a public benefit entity and unable to determine the interest rate implicit in the lease, the lessee's incremental borrowing rate or lessee's obtainable borrowing rate uses the rate of interest obtainable by the public benefit entity on deposits held with financial institutions. [FRS 102.20.67]. Lessees use the original discount rate when lease payments are updated for a change in expected amounts for residual value guarantees, payments dependent on an index or rate and changes to in-substance fixed lease payments, unless changes in the lease payments result from changes in floating interest rate. [FRS 102.20.68, FRS 102.20.69].

How we see it

When a lease includes a market rate adjustment (a market rent review), the negotiations between the lessee and the lessor may take some time to complete (the negotiation period). We believe any adjustment is recognised as an adjustment to lease payments when the market rent review is finalised and the change in contractual cash flows takes effect.

For example, consider a 10-year lease that has a market rate adjustment that applies from the end of year 5. The market rent review negotiations begin during year 5, but are not completed until September in year 6. During year 6, while the negotiation is ongoing, the lessee is required to pay the original contractual lease payments. At the conclusion of the negotiation period in September of year 6 (i.e., upon a final determination of the lease payments for year 6 until year 10), the new lease payments apply retrospectively from the beginning of year 6. Under this view, the lessee does not adjust the lease payments at the beginning of year 6 for the expected increase in rent. Instead, the lease payments are adjusted in September of year 6 when they are finalised. The lease liability is remeasured at this date and the additional cost is recognised as an adjustment to the right-of-use asset for the future lease payments.

How we see it

We believe the difference between the original lease payments and the new lease payments for the period when the new lease payments are applied retrospectively (from the beginning of year 6 to September of year 6 in the example above) may be recognised in profit or loss at the date the negotiations are finalised. Alternatively, the difference may be recognised as an adjustment to the right-of-use asset. In this case, it may also be necessary to consider the recoverability of the right-of-use asset.

6.5 Lease modifications

Extract from FRS 102

Appendix I

Glossary

lease modification	A change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease (eg adding or terminating the right to use one or more underlying assets, or extending or shortening the contractual lease term).

If a lease is modified (i.e., a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease), the modified contract is evaluated to determine whether it is or contains a lease (refer to 4.1.7 above). If a lease continues to exist, lease modification can result in:

- A separate lease (refer to 6.5.1 below).
- Or
- A change in the accounting for the existing lease (i.e., not a separate lease) (refer to 6.5.2 below).

The exercise of an existing purchase or renewal option or a change in the assessment of whether such options are reasonably certain to be exercised are not lease modifications but can result in the remeasurement of lease liabilities and right-of-use assets (refer to 6.4 above).

6.5.1 Determining whether a lease modification results in a separate lease

A lessee accounts for a lease modification (i.e., a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease) as a separate lease (i.e., separate from the original lease) when both of the following conditions are met:

- The modification increases the scope of the lease by adding the right to use one or more underlying assets.
- And
- The consideration for the lease increases by an amount commensurate with the stand-alone price for the increase in scope and any appropriate adjustments to that stand-alone price to reflect the circumstances of the particular contract. [FRS 102.20.70].

If both of these conditions are met, the lease modification results in two separate leases, the unmodified original lease and a separate new lease. Lessees account for the separate contract that contains a lease in the same manner as other new leases. The accounting for the unmodified lease is not changed (refer to Scenario A in Illustration 6-7 in 6.5.3 below).

If either of the conditions are not met, the modified lease is not accounted for as a separate lease (refer to 6.5.2 below).

The first condition above, is met if there is an additional right of use that was not included in the original lease. For example, if an existing lease for one floor of a building is modified to add a second floor, the right to use the second floor would meet the first condition as this adds a right of use that was not included in the original contract. Conversely, a modification that grants the lessee the right to use only the existing floor for an additional period of time does not meet the first condition above.

A lessee that terminates an existing lease and at the same time enters into a new lease arrangement with the same landlord evaluates the contract combination guidance discussed in 4.3 above.

Illustration 6-6: Lessee accounting for an immediate termination and new lease with the same landlord

On 1 January 20X4, Retailer entered into a 10-year lease with Landlord for retail store A in a shopping mall. Retail store A is 10,000 square feet. The lease requires Retailer to make fixed monthly payments at the beginning of each month, but the amount increases each year. There are no initial direct costs or incentives associated with the lease, and there are no non-lease components in the contract.

On 1 January 20X6, Retailer and Landlord negotiate a new contract to immediately terminate the lease for retail store A and at the same time enter into a new lease for retail store B (i.e., the termination of retail store A lease is dependent on obtaining retail store B). Retail store B is 5,000 square feet and is located in a more desirable location. The term of the new lease is eight years, consistent with the remaining term of the retail store A lease. There are no lease termination payments for retail store A, and no lease prepayments, initial direct costs or lease incentives associated with the retail store B lease. There are no non-lease components in the contract for the retail store B lease. Retailer determines that the contract combination guidance is met.

On 1 January 20X6, immediately before the parties signed the new lease agreement, Retailer has a remaining right-of-use asset of £115,000 and a lease liability of £120,000. The lease for retail store A is not impaired.

Based on the terms of the retail store B lease agreement, the initial measurement of the lease liability is £70,000, which represents the lease payments in the new lease, discounted using Retailer's incremental borrowing rate at the commencement date of the new lease.

Analysis: Under Section 20, Retailer accounts for the change as a termination of the existing lease of retail store A by removing the right-of-use asset and the lease liability from the balance sheet and including any difference between the right-of-use asset and the lease liability as part of the right-of-use asset it recognises for the new lease of retail store B (which in this case is similar to a lease incentive received to enter into the retail store B lease). Retailer records the following entries:

Dr	Lease liability (existing lease)	£120,000	
	Cr	Right-of-use asset (existing lease)	£115,000
Dr	Right-of-use asset (new lease)	£65,000 ^(a)	
	Cr	Lease liability (new lease)	£70,000

(a) Recognition of the right-of-use asset associated with the new lease of retail store B at the initial measurement of the lease liability of £70,000 less the difference between the lease liability and right-of-use asset from retail store A lease of £5,000 (i.e., which in this case is similar to a lease incentive received to enter into the retail store B lease).

6.5.2 Lessee accounting for a modification that does not result in a separate lease

For those lease modifications that do not result in a separate lease, lessees allocate the consideration in the contract (refer to 4.2.3.B above), determine the lease term of the modified lease (refer to 5.4.1 above), and remeasure the lease liability by discounting the revised lease payments. The lease liability is generally remeasured using a revised discount rate (refer to 5.6.2 above) at the effective date of the modification. [FRS 102.20.71]. However, an unchanged discount rate may be used when:

- The additional consideration from the lease modification is insignificant to the total consideration of the original lease.
- The lease modification decreases the scope of the lease by removing the right to one or more underlying assets, and the consideration for the lease decreases by an amount commensurate with the stand-alone price for the decrease in scope.

Or

- The lease modification decreases the consideration payable for the remaining term of the lease, but does not decrease the scope of the lease by removing the right to use one or more underlying assets.

[FRS 102.20.72].

For a modification that fully or partially decreases the scope of the lease (e.g., reduces the square footage of leased space), Section 20 requires a lessee to recognise a proportionate reduction in the carrying amount of the right-of-use asset, account for any incoming resources from a government grant or non-exchange transaction (refer to 6.2.1 above) in the modified lease, and recognise any resulting gain or loss in profit or loss (refer to Illustration 6-7 at 6.5.3 below). [FRS 102.20.73(a)].

For all other lease modifications which are not accounted for as a separate lease and not a decrease in scope, Section 20 requires the lessee to recognise the amount of the remeasurement of the lease liability as an adjustment to the corresponding right-of-use asset, net of any adjustment for incoming resources from a government grant or non-exchange transaction (refer to 6.2.1 above) in the modified lease (refer to Illustration 6-7 at 6.5.3 below. [FRS 102.20.73(b)]).

In some cases, the lessee and lessor may agree to a modification to the lease contract that starts at a later date (i.e., the terms of the modification take effect at a date later than the date when both parties agreed to the modification). For example, a lessee enters into a lease arrangement with a lessor to lease an asset for 10 years. At the beginning of year 8, the lessee and lessor agree to a modification to the contract that will take effect from the beginning of year 9.

- If the modification is an increase in the scope that does not result in a separate lease, the lessee will re-allocate the consideration in the modified contract to each of the existing lease and non-lease components and remeasure the lease liability at the date both parties agreed to the modification (the beginning of year 8).
- If the modification results in a separate lease component, the lessee will allocate the consideration in the modified contract to each of the existing and new lease and non-lease components at the date both parties agreed to the modification (the beginning of year 8). The lessee will remeasure the lease liability for the existing lease components at that date as well. However, recognition of the lease liability and right-of-use asset for any new lease component occurs at the commencement date of the new lease component (the beginning of year 9).
- If the modification is a decrease in the scope, the lessee will re-allocate the consideration in the modified contract to each existing lease and non-lease component and remeasure the lease liability and right-of-use asset at the effective date of the modification (the beginning of year 8).

6.5.3 Examples - lessees' accounting for lease modifications

The following Illustrations are based on IFRS 16, and reflect how lessees may account for lease modifications. [IFRS 16.IE7, IFRS 16.IE Example 15, IFRS 16.IE Example 16, IFRS 16.IE Example 17, IFRS 16.IE Example 18, IFRS 16.IE Example 19]. However, as noted at 6.5.2 above, unlike IFRS 16, Section 20 permits a lessee to use an unchanged discount rate to remeasure the lease liability for certain lease modifications that are not accounted for as a separate lease. [FRS 102.20.72]. Some of the scenarios in the Illustration are therefore updated to provide additional guidance where an FRS 102 optional simplification may apply.

The Illustrations below do not reflect any adjustments for incoming resources from a government grant or non-exchange transaction. As noted at 2.3 above, unlike FRS 102, IFRS 16 does not provide any specific guidance on leases containing a non-exchange component.

Illustration 6-7: Lessee accounting for lease modifications

Scenario A: Modification that is a separate lease

Lessee enters into a 10-year lease for 2,000 square metres of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to include an additional 3,000 square metres of office space in the same building. The additional space is made available for use by Lessee at the end of the second quarter of Year 6. The increase in total consideration for the lease is commensurate with the current market rate for the new 3,000 square metres of office space, adjusted for the discount that Lessee receives reflecting that Lessor does not incur costs that it would otherwise have incurred if leasing the same space to a new tenant (for example, marketing costs).

Lessee accounts for the modification as a separate lease, separate from the original 10-year lease. This is because the modification grants Lessee an additional right to use an underlying asset, and the increase in consideration for the lease is commensurate with the stand-alone price of the additional right-of-use adjusted to reflect the circumstances of the contract. In this example, the additional underlying asset is the new 3,000 square metres of office space. Accordingly, at the commencement date of the new lease (at the end of the second quarter of Year 6), Lessee recognises a right-of-use asset and a lease liability relating to the lease of the additional 3,000 square metres of office space. Lessee does not make any adjustments to the accounting for the original lease of 2,000 square metres of office space as a result of this modification. [IFRS 16.IE Example 15].

Scenario B: Modification that increases the scope of the lease by extending the contractual lease term

Lessee enters into a 10-year lease for 5,000 square metres of office space. The annual lease payments are £100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum, and Lessee chooses to discount lease payments at Lessee's incremental borrowing rate rather than Lessee's obtainable borrowing rate. At the beginning of Year 7, Lessee and Lessor agree to amend the original lease by extending the contractual lease term by four years. The annual lease payments are unchanged (i.e., £100,000 payable at the end of each year from Year 7 to Year 14). Lessee's incremental borrowing rate at the beginning of Year 7 is 7 per cent per annum.

At the effective date of the modification (at the beginning of Year 7), Lessee remeasures the lease liability based on: (a) an eight-year remaining lease term, (b) annual payments of £100,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified lease liability equals £597,130. The lease liability immediately before the modification (including the recognition of the interest expense until the end of Year 6) is £346,511. Lessee recognises the difference between the carrying amount of the modified lease liability and the carrying amount of the lease liability immediately before the modification (£250,619) as an adjustment to the right-of-use asset. [IFRS 16.IE Example 16].

Scenario C: Modification that decreases the scope of the lease

Lessee enters into a 10-year lease for 5,000 square metres of office space. The annual lease payments are £50,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum and Lessee chooses to discount lease payments at Lessee's incremental borrowing rate rather than Lessee's obtainable borrowing rate. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to reduce the space to only 2,500 square metres of the original space starting from the end of the first quarter of Year 6. The annual fixed lease payments (from Year 6 to Year 10) are £30,000. Lessee's incremental borrowing rate at the beginning of Year 6 is 5 per cent per annum.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of £30,000 and (c) Lessee's incremental borrowing rate of 5 per cent per annum. This equals £129,884.

Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset on the basis of the remaining right-of-use asset (i.e., 2,500 square metres corresponding to 50 per cent of the original right-of-use asset).

50 per cent of the pre-modification right-of-use asset (£184,002) is £92,001. Fifty per cent of the pre-modification lease liability (£210,618) is £105,309. Consequently, Lessee reduces the carrying amount of the right-of-use asset by £92,001 and the carrying amount of the lease liability by £105,309. Lessee recognises the difference between the decrease in the lease liability and the decrease in the right-of-use asset (£105,309 - £92,001 = £13,308) as a gain in profit or loss at the effective date of the modification (at the beginning of Year 6).

Lessee recognises the difference between the remaining lease liability of £105,309 and the modified lease liability of £129,884 (which equals £24,575) as an adjustment to the right-of-use asset reflecting the change in the consideration paid for the lease and the revised discount rate. [IFRS 16.IE Example 17].

As noted at 6.5.2 above, unlike IFRS 16, Section 20 permits a lessee to use an unchanged discount rate to remeasure the lease liability for certain lease modifications that are not accounted for as a separate lease. [FRS 102.20.72]. Therefore, as an alternative to the treatment outlined above in this scenario, if the lessee determined that the decrease in consideration for the lease was commensurate with the stand-alone price for the decrease in office space leased, the lessee could instead elect to use an unchanged discount rate (i.e., use the lessee's incremental borrowing rate at the commencement date of 6 per cent per annum) to remeasure the lease liability at the effective date of the modification. [FRS 102.20.72(b)].

Scenario D: Modification that both increases and decreases the scope of the lease

Lessee enters into a 10-year lease for 2,000 square metres of office space. The annual lease payments are £100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum and Lessee chooses to discount lease payments at Lessee's incremental borrowing rate rather than Lessee's obtainable borrowing rate. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to (a) include an additional 1,500 square metres of space in the same building starting from the beginning of Year 6 and (b) reduce the lease term from 10 years to eight years. The annual fixed payment for the 3,500 square metres is £150,000 payable at the end of each year (from Year 6 to Year 8). Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum.

The consideration for the increase in scope of 1,500 square metres of space is not commensurate with the stand-alone price for that increase adjusted to reflect the circumstances of the contract. Consequently, Lessee

does not account for the increase in scope that adds the right to use an additional 1,500 square metres of space as a separate lease.

The pre-modification right-of-use asset and the pre-modification lease liability in relation to the lease are as follows.

Year	Lease liability				Right-of-use asset		
	Beginning balance £	6% interest expense £	Lease payment £	Ending balance £	Beginning balance £	Depreciation charge £	Ending balance £
1	736,009	44,160	(100,000)	680,169	736,009	(73,601)	662,408
2	680,169	40,810	(100,000)	620,979	662,408	(73,601)	588,807
3	620,979	37,259	(100,000)	558,238	588,807	(73,601)	515,206
4	558,238	33,494	(100,000)	491,732	515,206	(73,601)	441,605
5	491,732	29,504	(100,000)	421,236	441,605	(73,601)	368,004
6	421,236				368,004		

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability on the basis of: (a) a three-year remaining lease term, (b) annual payments of £150,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified liability equals £393,647, of which (a) £131,216 relates to the increase of £50,000 in the annual lease payments from Year 6 to Year 8 and (b) £262,431 relates to the remaining three annual lease payments of £100,000 from Year 6 to Year 8.

Decrease in the lease term

At the effective date of the modification (at the beginning of Year 6), the pre-modification right-of-use asset is £368,004. Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset based on the remaining right-of-use asset for the original 2,000 square metres of office space (i.e., a remaining three-year lease term rather than the original five-year lease term). The remaining right-of-use asset for the original 2,000 square metres of office space is £220,802 (i.e., £368,004 ÷ 5 × 3 years).

At the effective date of the modification (at the beginning of Year 6), the pre-modification lease liability is £421,236. The remaining lease liability for the original 2,000 square metres of office space is £267,301 (i.e., present value of three annual lease payments of £100,000, discounted at the original discount rate of 6 per cent per annum).

Consequently, Lessee reduces the carrying amount of the right-of-use asset by £147,202 (£368,004 - £220,802), and the carrying amount of the lease liability by £153,935 (£421,236 - £267,301). Lessee recognises the difference between the decrease in the lease liability and the decrease in the right-of-use asset (£153,935 - £147,202 = £6,733) as a gain in profit or loss at the effective date of the modification (at the beginning of Year 6).

Lease liability	£153,935
Right-of-use asset	£147,202
Gain	£6,733

At the effective date of the modification (at the beginning of Year 6), Lessee recognises the effect of the remeasurement of the remaining lease liability reflecting the revised discount rate of 7 per cent per annum, which is £4,870 (£267,301 - £262,431), as an adjustment to the right-of-use asset.

Lease liability	£4,870
Right-of-use asset	£4,870

Increase in the leased space

At the commencement date of the lease for the additional 1,500 square metres of space (at the beginning of Year 6), Lessee recognises the increase in the lease liability related to the increase in scope of £131,216 (i.e., present value of three annual lease payments of £50,000, discounted at the revised interest rate of 7 per cent per annum) as an adjustment to the right-of-use asset.

Right-of-use asset	£131,216
Lease liability	£131,216

The modified right-of-use asset and the modified lease liability in relation to the modified lease are as follows.

Year	Lease liability				Right-of-use asset		
	Beginning balance	7% interest expense	Lease payment	Ending balance	Beginning balance	Depreciation charge	Ending balance
	£	£	£	£	£	£	£
6	393,647	27,556	(150,000)	271,203	347,148	(115,716)	231,432
7	271,203	18,984	(150,000)	140,187	231,432	(115,716)	115,716
8	140,187	9,813	(150,000)	-	115,716	(115,716)	-

[IFRS 16.IE Example 18].

Scenario E: Modification that is a change in consideration only

Lessee enters into a 10-year lease for 5,000 square metres of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to reduce the lease payments from £100,000 per year to £95,000 per year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum and Lessee chooses to discount lease payments at Lessee's incremental borrowing rate rather than Lessee's obtainable borrowing rate. Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum. The annual lease payments are payable at the end of each year.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of £95,000, and (c) Lessee's incremental borrowing rate of 7 per cent per annum. Lessee recognises the difference between the carrying amount of the modified liability (£389,519) and the lease liability immediately before the modification (£421,236) of £31,717 as an adjustment to the right-of-use asset. [IFRS 16.IE Example 19].

As noted at 6.5.2 above, Section 20 permits a lessee to use an unchanged discount rate to remeasure the lease liability for certain lease modifications that are not accounted for as a separate lease. [FRS 102.20.72]. In Scenario E, the lease modification decreases the consideration payable for the remaining term of the lease but does not decrease the scope of the lease by removing the right to use one or more underlying assets.

Therefore, rather than remeasuring the lease liability at a revised discount rate of 7%, the lessee could elect to use an unchanged discount rate (i.e., to use the lessee's incremental borrowing rate at the commencement date of 6 per cent per annum) to remeasure the lease liability at the effective date of the modification.

[FRS 102.20.72(c)].

6.6 Other lessee matters

6.6.1 Impairment of right-of-use assets

Extract from FRS 102

20.59 A lessee shall apply Section 27 *Impairment of Assets* to determine whether the right-of-use asset is impaired and to account for any impairment loss identified.

Lessees' right-of-use assets are subject to impairment requirements in Section 27. [FRS 102.20.59].

Section 27 requires an impairment indicator analysis at each reporting period. If any indicators are present, the entity is required to estimate the recoverable amount of the asset (or the cash-generating unit (CGU) of which the asset is a part). [FRS 102.27.7, FRS 102.27.8]. The entity must recognise an impairment loss if the recoverable amount of the CGU is less than the carrying amount of the CGU. [FRS 102.27.5]. After an impairment loss is recognised, the adjusted carrying amount of the right-of-use asset would be its new basis for depreciation.

Subsequent reversal of a previously recognised impairment loss needs to be assessed if there is any indication that an impairment loss recognised in prior periods may no longer exist or may have decreased. [FRS 102.27.29]. In recognising any reversal, the increased carrying amount of the asset must not exceed the carrying amount that would have been determined after depreciation, had there been no impairment.

[FRS 102.27.30(c), FRS 102.27.31(c)]. Refer to Chapter 29 for further discussion of the requirements of Section 27.

6.6.2 Leases denominated in a foreign currency

Lessees apply Section 30 *Foreign Currency Translation*, to leases denominated in a foreign currency. As they do for other monetary liabilities, lessees remeasure the foreign currency-denominated lease liability using the exchange rate at each reporting date. [FRS 102.30.9]. Any changes to the lease liability due to exchange rate changes are recognised in profit or loss. [FRS 102.30.9]. Because the right-of-use asset is a non-monetary asset measured at historical cost, it is not affected by changes in the exchange rate. [FRS 102.30.9]. Refer to Chapter 32 for further discussion of the requirements of Section 30.

6.6.3 Portfolio application

Section 20 applies to individual leases. However, entities that have a large number of leases of similar assets (e.g., leases of a fleet of similar rolling stock) may face practical challenges in applying the leases model on a lease-by-lease basis. The FRC acknowledged the concerns and included a practical expedient that allows entities to use a portfolio approach for leases with similar characteristics (e.g., a similar lease term for a similar class of underlying asset in a similar economic environment). If accounting for a portfolio, an entity uses estimates and assumptions that reflect the size and composition of the portfolio. [FRS 102.20.13].

6.7 Presentation

Extract from FRS 102

Presentation

- 20.74** A lessee shall either present in the statement of financial position, or disclose in the notes:
- (a) right-of-use assets separately from other assets. If a lessee does not present right-of-use assets separately in the statement of financial position, the lessee shall:
 - (i) include right-of-use assets within the same line item as that within which the corresponding underlying assets would be presented if they were owned; and
 - (ii) disclose which line items in the statement of financial position include those right-of-use assets.
 - (b) lease liabilities separately from other liabilities. If the lessee does not present lease liabilities separately in the statement of financial position, the lessee shall disclose which line items in the statement of financial position include those liabilities.
- 20.75** The requirement in paragraph 20.74(a) does not apply to right-of-use assets that meet the definition of investment property, which shall be presented in the statement of financial position as investment property.

As discussed in Chapter 6 at 4, UK companies and LLPs may present their statement of financial position and income statement using either statutory formats or adapted formats.

The following table summarises how lease-related amounts and activities are presented in lessees' financial statements if adapted formats are used:

Financial statement	Lessee presentation
Statement of financial position	▪ Right-of-use assets presented either: ▪ Separately from other assets (e.g., owned assets). ▪ Together with other assets as if they were owned, with disclosures of the statement of financial position line items that include right-of-use assets and their amounts. [FRS 102.20.74]. ▪ Right-of-use assets that meet the definition of investment property are presented as investment property. [FRS 102.20.75]. ▪ Lease liabilities presented either: ▪ Separately from other liabilities. ▪ Together with other liabilities with disclosure of the statement of financial position line items that include lease liabilities and their amounts. [FRS 102.20.74].

Income Statement	Lease-related depreciation and lease-related interest expense are presented separately (i.e., lease-related depreciation and lease-related interest expense cannot be combined). Interest expense on the lease liability is a component of finance costs. <i>[IFRS 16.49]</i> .
Statement of cash flows	▪ Cash payments for the principal portion of the lease liability are presented within financing activities. <i>[FRS 102.7.6(e)]</i>. ▪ Cash payments for the interest portion of the lease liability are presented as either operating or financing activities depending on the accounting policy of the entity. <i>[FRS 102.7.15]</i>. ▪ Lease payments for short-term leases and leases of low-value assets not recognised on the statement of financial position and variable lease payments not included in the lease liability are presented within operating activities. <i>[FRS 102.7.4(h)]</i>. ▪ Non-cash activity (e.g., the initial recognition of the lease at commencement) is disclosed as a supplemental non-cash item. <i>[FRS 102.7.18]</i>. Cash flows from leasing transactions are discussed further in Chapter 7 at 3.8.

For entities presenting primary statements using statutory formats, the summary presented in the table above will be relevant to the presentation of the income statement and statement of cash flows.

For the statement of financial position (balance sheet), Part 1 of Schedule 1 to the Regulations and Part 1 of Schedule 1 to the LLP Regulations, provide a choice of two balance sheet statutory formats, format 1 and format 2. Format 1 is a vertical format and is adopted by virtually all UK companies and LLPs. Format 2 presents assets separately from capital, reserves and liabilities and is rarely used. The discussion below therefore covers only the format 1 balance sheets applicable to companies (other than banking or insurance companies) and LLPs.

With regards to the presentation of right-of-use assets, format 1 requires fixed assets to be presented on the face of the balance sheet, disaggregated into subheadings for intangible assets, tangible assets and investments. The formats also include sub-headings, denoted with an Arabic number, which can be (and often are in practice), presented in the notes. For tangible assets the subheadings reflected in format 1 are:

- Land and buildings
- Plant and machinery
- Fixtures, fittings, tools and equipment
- Payments on account and assets in the course of construction *[1 Sch]*

As discussed in Chapter 6 at 3.4.2 where statutory formats are used, the General Rules to the formats allow any item to be shown in a company's (or an LLP's) balance sheet in greater detail than required by the particular format used. Entities using statutory balance sheet formats may therefore choose to present right-of-use assets separately from other assets (i.e., as a separate sub-heading of fixed assets on the face of the balance sheet), or within the same line item within which the corresponding underlying asset would be presented if they were owned (i.e., within the tangible or intangible (depending on the nature of the underlying asset) sub-headings on the face of the balance sheet). *[FRS 102.20.74(a)]*.

With regards to the presentation of lease liabilities, the Regulations (and LLP Regulations) distinguish between:

- Creditors: amounts falling due within one year
- And
- Creditors: amounts falling due after more than one year

These two line items are required to be shown on the face of the balance sheet in the format 1 balance sheet.

The format 1 balance sheet includes several sub-headings for both amounts falling due within one year and amounts falling due after more than one year, denoted with an Arabic number, which can be (and often are in practice) presented in the notes to the accounts.

Under the format 1 balance sheet, we would expect lease liabilities to be included within Creditors; amounts falling due within one year and Creditors: amounts falling due after more than one year on the face of the balance sheet, and separately disclosed within the notes to the accounts. However, as noted above, the General Rules to the formats allow any item to be shown in a company's (or an LLP's) balance sheet in greater detail than required by the particular format used. Paragraph 74(b) of Section 20 requires that if the lessee does not present lease liabilities separately in the statement of financial position, the lessee shall disclose which line items in the statement of financial position include those liabilities. [FRS 102.20.74(b)].

6.8 Lessee disclosures

A lessee is required to disclose a general description of its significant leasing arrangements. [FRS 102.20.76]. If necessary to enable users to understand its significant leasing arrangements, a lessee is required to provide additional qualitative and quantitative information. At a minimum, when relevant, a lessee discloses:

- Information about future cash outflows to which the lessee is potentially exposed that are not reflected in the measurement of lease liabilities, including variable lease payments, extension options and termination options, residual value guarantees and leases not yet commenced to which the lessee is committed.
- Information about restrictions or covenants imposed by leases.
- The types of discount rate (interest rate implicit in the lease, lessee's incremental borrowing rate or lessee's obtainable borrowing rate) used in calculating lease liabilities and the proportion of the total lease liability calculated using each of those types of discount rate.
- Information about sale and leaseback transactions, including:
 - The lessee's reasons for sale and leaseback transactions and the prevalence of those transactions.
 - Key terms and conditions of individual sale and leaseback transactions.
 - Payments not included in the measurement of lease liabilities.
 - The cash flow effect of sale and leaseback transactions in the reporting period.
 - When relevant, the entity having made the accounting policy choice to measure the right of use asset arising from the leaseback in accordance with paragraph 46 of Section 20 (i.e., applying the general initial measurement rules for a new lease), as permitted by paragraph 123(a)(ii) of Section 20 in respect of sale and leaseback transactions when the transfer of the asset is a sale (refer to 9.2.1 below). [FRS 102.20.77].

A lessee is also required to disclose the following amounts for the reporting period:

- Interest expense on lease liabilities.
- The expense relating to short-term leases accounted for applying paragraph 6 of Section 20 (refer to 6.1.1 above). This expense need not include the expense relating to leases with a lease term of one month or less.
- The expense relating to leases of low-value assets accounted for applying paragraph 6 of Section 20 (refer to 6.1.2 above). This expense does not include the expense relating to short-term leases of low-value assets disclosed in accordance with the bullet point above.
- The expense relating to variable lease payments not included in the measurement of lease liabilities.
- Income from subleasing right-of-use assets.
- Total cash outflow for leases.
- Gains or losses arising from sale and leaseback transactions. [FRS 102.20.80].

How we see it

Section 20 requires disclosure of the total cash outflow for leases. It does not explicitly state that leases of low-value assets and short-term leases are excluded. Therefore, we believe the cash outflows related to those leases should be included in the disclosure.

A lessee must also disclose the following amounts for the reporting period for right-of-use assets, by class of underlying asset:

- The gross carrying amount and the accumulated depreciation at the beginning and end of the reporting period
- A reconciliation of the carrying amount at the beginning and end of the reporting period showing separately:
 - Additions
 - Disposals
 - Acquisitions through business combinations
 - Revaluations
 - Impairment losses recognised or reversed in profit or loss in accordance with Section 27
 - Depreciation
 - Other changes

This reconciliation is not required to be presented for prior periods *[FRS 102.20.81]*

Section 20 also requires the following:

- An entity that has applied either or both of the practical expedients in paragraphs 13 (portfolio application) and 33 of Section 20 (to not separate non-lease components) must disclose that fact (refer to 6.6.3 above and 4.2.2.B above respectively). *[FRS 102.20.78]*.
- When an entity has remeasured a lease liability as a result of a lease modification (refer to 6.5 above) and has used an unchanged discount rate, it must disclose:
 - That fact.
 - The carrying amount at the end of the reporting period of lease liabilities which have been remeasured in that manner. *[FRS 102.20.79]*.
- A lessee that accounts for short-term leases or leases of low value assets applying paragraph 6 of Section 20 (refer to 6.1.1 and 6.1.2 above) must disclose that fact and disclose separately the amount of its lease commitments for short-term leases and for leases of low-value assets at the end of the reporting period for each of the following periods:
 - Not later than one year.
 - Later than one year and not later than five years.
 - Later than five years. *[FRS 102.20.82]*.
- For right-of-use assets meeting the definition of investment property, a lessee is required to apply the disclosure requirements in Section 16. In that case, a lessee is not required to provide the disclosures in paragraphs 80(e) (income from subleasing right-of-use assets) and 81 (see above) of Section 20 for those right-of-use assets. *[FRS 102.20.83]*.
- For right-of-use assets meeting the definition of heritage assets, a lessee is required to apply the disclosure requirements in paragraphs 55 and 56 of Section 34 (refer to Chapter 36 at 5.4.4). In that case, a lessee is not required to provide the disclosures required by paragraphs 80(e) (income from subleasing right-of-use assets) and 81 (see above) of Section 20 for those right-of-use assets. *[FRS 102.20.84]*.
- If a lessee measures right-of-use assets at revalued amounts applying Section 17, the lessee is required to provide the disclosures required by paragraphs 31(a) and 32A of Section 17 (refer to Chapter 20 at 3.10.1) for those right-of-use assets. *[FRS 102.20.85]*.

In addition to the lessee disclosures required by Section 20, UK Company Law (i.e., the Regulations) and the LLP Regulations require disclosure, for the aggregate of all items shown under 'creditors' in the entity's balance sheet (Statement of Financial Position), of the following:

- The amount of any debts included under creditors which are payable or repayable otherwise than by instalments and fall due for payment or repayment after the end of the period of five years beginning with the day next following the end of the financial year.

And

- In the case of any debts so included which are payable or repayable by instalments, the amount of any instalments which fall due for payment after the end of that period. *[1 Sch 61(1), 1 Sch 59(1)(LLP)]*.

'Creditors', for the requirements above, will include lease liabilities.

7 Requirements of Section 20 for leases: Lessor accounting

7.1 Lease classification

Extract from FRS 102

20.86 A lessor shall classify each of its leases as either an operating lease or a finance lease.

20.87 A lease is classified as a finance lease if it transfers substantially all the risks and rewards incidental to ownership of an underlying asset. A lease is classified as an operating lease if it does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset.

[FRS 102.20.86, FRS 102.20.87]

At inception, lessors classify all leases as finance leases or operating leases. [FRS 102.20.91]. Lease classification determines how and when a lessor recognises lease income and what assets are recorded. The criteria used for lease classification are discussed in detail below.

7.1.1 Criteria for lease classification

The classification of leases in Section 20 is based on the extent to which the risks and rewards incidental to ownership of the underlying asset lie with the lessor or the lessee. It depends on the substance of the transaction rather than the form of the contract. Section 20 lists a number of examples that individually, or in combination, would normally lead to a lease being classified as a finance lease:

- The lease transfers ownership of the asset to the lessee by the end of the lease term.
 - The lessee has the option to purchase the asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable for it to be reasonably certain, at the inception date, that the option will be exercised.
 - The lease term is for the major part of the economic life of the asset even if title is not transferred.
 - At the inception date, the present value of the lease payments amounts to at least substantially all of the fair value of the asset.
 - The asset is of such a specialised nature that only the lessee can use it without major modifications.
- [FRS 102.20.88].

Section 20 does not provide quantitative indicators or thresholds for the assessment of the terms 'major part' and 'substantially all' to determine that a lease should be classified as a finance lease rather than as an operating lease. Under Section 20, entities apply qualitative, rather than quantitative, assessments to determine whether the risks and rewards incidental to ownership of a leased asset lie with the lessor or the lessee. Accordingly, assessing whether a lease term is for the major part of the economic life of an asset or whether the present value of the lease payments amounts to at least substantially all of the fair value of a leased asset is a matter of judgement.

Similarly, determining whether the exercise price in a lessee's option to purchase the underlying asset is expected to be 'sufficiently lower' than the fair value of the underlying asset at the date the option becomes exercisable, is a matter of judgement and depends on the facts and circumstances of the particular lease.

Paragraph 88 of Section 20 is clear that these are "Examples of situations that individually or in combination would normally lead to a lease being classified as a finance lease". [FRS 102.20.88].

Consequently, it is possible that the existence of certain of the situations, on their own, may determine the classification of a lease, whereas other leases may need to be evaluated in combination with other situations or indicators. The overriding consideration is whether the lease transfers from the lessor to the lessee substantially all the risks and rewards incidental to ownership of an underlying asset.

Section 20 also lists the following indicators of situations that, individually or in combination, could also lead to a lease being classified as a finance lease:

- If the lessee can cancel the lease, the lessor's losses associated with the cancellation are borne by the lessee.
- Gains or losses from the fluctuation in the fair value of the residual accrue to the lessee (e.g., in the form of a rent rebate that is equal to most of the sale proceeds at the end of the lease).
- The lessee has the ability to continue the lease for a secondary period at a rent that is substantially lower than market rent. [FRS 102.20.89].

Assessing the substance of the transaction involves considering all relevant factors. This includes considering the probability of different gain and loss outcomes relating to the residual accruing to the lessee and is not limited to the maximum possible amount at risk.

Illustration 7-1: Gains and losses from the fluctuation in the fair value of the residual

At the end of a lease, the underlying asset (the item of equipment) of a lease will be disposed of. The lessee is entitled to a rent rebate equalling 100% of the sales proceeds with a cap of £1,000. The distribution of the probability of the sales proceeds is as follows:

Sales proceeds	Probability %
Up to £1,000	95
£1,000 to £2,000	5
Over £2,000	0

Analysis: The sales proceeds could be as high as £2,000 and the rent rebate is capped at £1,000. However, the probability assessment suggests that it would be unlikely for the sales proceeds to exceed the capped amount. Therefore, it would be appropriate to conclude the gains or losses from the fluctuation in the fair value of the residual generally accrue to the lessee.

The examples and indicators in paragraphs 88 and 89 of Section 20 are not always conclusive. If it is clear from other features that the lease does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset, the lease is classified as an operating lease. For example, this may be the case if ownership of the underlying asset transfers at the end of the lease for a variable payment equal to its then fair value, or if there are variable lease payments, as a result of which the lessor does not transfer substantially all such risks and rewards. [FRS 102.20.90].

How we see it

In our view, other considerations that could be made in determining the economic substance of the lease arrangement include the following:

- Are the lease rentals based on a market rate for use of the asset (which would indicate an operating lease) or a financing rate for use of the funds, which would be indicative of a finance lease?
- Is the existence of put and call options a feature of the lease? If so, are they exercisable at a predetermined price or formula (indicating a finance lease) or are they exercisable at the market price at the time the option is exercised (indicating an operating lease)?

Section 20 contains specific requirements relating to classification of subleases by an intermediate lessor as finance or operating leases (refer to 8.2 below).

7.1.2 Lease classification test for land and buildings

Section 20 does not include any specific guidance in respect of contracts that involve the right to use land and land improvements (e.g., buildings). In contrast, IFRS 16 does include specific guidance which requires a lessor to classify (refer to 7.1 above) and account for the right to use land as a separate lease component, unless the accounting effect of doing so is immaterial to the lease. [IFRS 16.B57]. Despite the absence of an equivalent paragraph in Section 20, the general requirements around identifying and separating lease components are similar to IFRS 16, and we would therefore expect entities applying Section 20 to identify and account for land and building components separately using the guidance in 4.2.1 above.

Separation of the land may not be necessary when the amount that would be recognised for the land lease component is immaterial to the lease.

7.1.3 Residual value guarantees included in the lease classification test

As discussed at 5.5.7 above, for lessors, lease payments are defined to include any residual value guarantees provided to the lessor by the lessee, a party related to the lessee, or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. [FRS 102 Appendix I]. Therefore, in evaluating the lease classification criteria in Section 20, lessors are required to include in the 'substantially all' test any (i.e., the maximum obligation) residual value guarantees provided by both lessees and any other third party unrelated to the lessor.

7.1.4 Reassessment of lease classification

Lease classification is made at the inception date and is reassessed only if there is a lease modification (refer to 7.5 below). Changes in estimates (e.g., changes in estimates of the economic life or residual value of the underlying asset), or changes in circumstances (e.g., default by the lessee), do not give rise to a new classification of a lease for accounting purposes. [FRS 102.20.91].

7.2 Key concepts applied by lessor

Extract from FRS 102

Appendix I

gross investment in the lease	The aggregate of: (a) the lease payments receivable by a lessor under a finance lease; and (b) any unguaranteed residual value accruing to the lessor.
Interest rate implicit in the lease	The rate of interest that causes the present value of: (a) the lease payments; and (b) the unguaranteed residual value to equal the sum of: (i) the fair value of the underlying asset; and (ii) any initial direct costs of the lessor.
net investment in the lease	The gross investment in the lease discounted at the interest rate implicit in the lease.
unguaranteed residual value	That portion of the residual value of the underlying asset, the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

At lease commencement, lessors apply the key concepts described in 5 above such as determining the initial direct costs, lease term, lease payments, fair value of the underlying asset and the interest rate implicit in the lease. Lessors also apply the following lessor accounting concepts to recognise and measure their leases.

Gross investment in the lease

The lessor's gross investment in a finance lease consists of the following undiscounted amounts:

- Lease payments receivable by the lessor under a finance lease (refer to 5.5 above).
- Any unguaranteed residual value accruing to the lessor - the unguaranteed residual value is the portion of the residual value of the underlying asset, the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

Net investment in the lease

A lessor's net investment in a finance lease consists of the gross investment in the lease discounted at the interest rate implicit in the lease.

7.3 Finance leases

7.3.1 Initial recognition and measurement

Extract from FRS 102

Recognition and measurement

- 20.93** At the commencement date, a lessor shall recognise assets held under a finance lease in its statement of financial position and present them as a receivable at an amount equal to the net investment in the lease.

Initial measurement

- 20.94** The lessor shall use the interest rate implicit in the lease to measure the net investment in the lease. In the case of a sublease, if the interest rate implicit in the sublease cannot be readily determined, an intermediate lessor may use the discount rate used for the head lease (adjusted for any initial direct costs associated with the sublease) to measure the net investment in the sublease.

- 20.95** Initial direct costs, other than those incurred by manufacturer or dealer lessors, are included in the initial measurement of the net investment in the lease and reduce the amount of income recognised over the lease term. The interest rate implicit in the lease is defined in such a way that the initial direct costs are included automatically in the net investment in the lease; there is no need to add them separately.

Initial measurement of the lease payments included in the net investment in the lease

- 20.96** At the commencement date, the lease payments included in the measurement of the net investment in the lease comprise the following payments for the right to use the underlying asset during the lease term that are not received at the commencement date:
- (a) fixed payments (including in-substance fixed payments as described in paragraph 20.52), less any lease incentives payable;
 - (b) variable lease payments that depend on an index or a rate, initially measured using the index or rate as at the commencement date (as described in paragraph 20.53);
 - (c) any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee;
 - (d) the exercise price of a purchase option if the lessee is reasonably certain to exercise that option (assessed considering the factors described in paragraphs 20.40 to 20.42); and
 - (e) payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.

[FRS 102.20.93, FRS 102.20.94, FRS 102.20.95, FRS 102.20.96]

Illustration 7-2: The lessor's gross and net investment in the lease

Details of a non-cancellable lease are, as follows:

- The asset has a fair value of £10,000
- The lessee is required to make five annual rentals payable in advance of £2,100
- The unguaranteed estimated residual value at the end of five years is £1,000
- There is no guaranteed residual value

The lessor's direct costs have been excluded for simplicity.

The interest rate implicit in the lease is that which gives a present value of £10,000 for the five rentals plus the total estimated unguaranteed residual value at the end of year 5. This rate is 6.62%.

Year	Net investment in the lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period	Gross earnings allocated to future periods	Net investment in the lease at end of period
	£	£	£	£	£	£
1	10,000	2,100	523	9,400	977	8,423
2	8,423	2,100	419	7,300	558	6,742
3	6,742	2,100	307	5,200	251	4,949
4	4,949	2,100	189	3,100	62	3,038
5	3,038	2,100	62	1,000	-	1,000
		<u>10,500</u>	<u>1,500</u>			

The lessor's gross investment in the lease is the total rents receivable of £10,500 and the unguaranteed residual value of £1,000. The gross earnings are therefore £1,500.

The gross investment in the lease at any point in time comprises the aggregate of the rentals receivable in future periods and the unguaranteed residual value, e.g., at the end of year 2, the gross investment of £7,300 is three years' rental of £2,100 plus the unguaranteed residual of £1,000. The net investment, which is the amount at which the debtor will be recorded in the statement of financial position, is £7,300 less the earnings allocated to future periods of £558 = £6,742.

At lease commencement, a lessor accounts for a finance lease, as follows:

- Derecognises the carrying amount of the underlying asset.
- Recognises the net investment in the lease.

And

- Recognises, in profit or loss, any selling profit or selling loss.

For finance leases (other than those involving manufacturer and dealer lessors - refer to 7.3.2 below), initial direct costs are included in the initial measurement of the finance lease receivable. Initial direct costs are included in the interest rate implicit in the lease and are not added separately. [FRS 102.20.95].

The net investment in the lease is initially measured as the sum of: (1) the present value of both the lease payments (refer to 5.5 above); and (2) the present value of the unguaranteed residual asset, both discounted using the interest rate implicit in the lease (refer to 5.6 above).

7.3.2 Manufacturer or dealer lessors

Extract from FRS 102

- 20.97** At the commencement date, a manufacturer or dealer lessor shall recognise the following for each of its finance leases:
- (a) revenue being the fair value of the underlying asset, or, if lower, the present value of the lease payments accruing to the lessor, discounted using a market rate of interest;
 - (b) the cost of sale being the cost, or carrying amount if different, of the underlying asset less the present value of the unguaranteed residual value; and
 - (c) selling profit or loss (being the difference between revenue and the cost of sale) in accordance with its policy for outright sales to which Section 23 applies. A manufacturer or dealer lessor shall recognise selling profit or loss on a finance lease at the commencement date, regardless of whether the lessor transfers the underlying asset as described in Section 23.

[FRS 102.20.97]

Manufacturers or dealers often offer to customers the choice of either buying or leasing an asset. A finance lease of an asset by a manufacturer or dealer lessor gives rise to profit or loss equivalent to the profit or loss resulting from an outright sale of the underlying asset, at normal selling prices, reflecting any applicable volume or trade discounts. [FRS 102.20.98].

Manufacturer or dealer lessors sometimes quote artificially low rates of interest to attract customers. The use of such a rate would result in a lessor recognising an excessive portion of the total income from the transaction at the commencement date. If artificially low rates of interest are quoted, a manufacturer or dealer lessor shall restrict selling profit to that which would apply if a market rate of interest were charged. [FRS 102.20.99].

Costs incurred by manufacturer or dealer lessors in connection with obtaining a finance lease are excluded from the definition of initial direct costs and, thus, are excluded from the net investment in the lease.

[FRS 102.20.100].

As Section 20 contains no specific requirements to deal with leases that have become onerous after inception but before the commencement date, the requirements in Section 21 apply to those contracts.

Illustration 7-3: Manufacturer or dealer lessors

A company manufactures specialised machinery. The company offers customers the choice of either buying or leasing the machinery. A customer chooses to lease the machinery. Details of the arrangement are, as follows:

- The lease commences on 1 January 20X6 and lasts for three years.
- The lessee is required to make three annual rentals payable in arrears of £57,500.
- The leased machinery is returned to the lessor at the end of the lease.
- The fair value of the machinery is £150,000, which is equivalent to the selling price of the machinery.
- The machinery cost £100,000 to manufacture. The lessor incurred costs of £2,500 to negotiate and arrange the lease.
- The expected useful life of the machinery is 3 years. The machinery has an expected residual value of £10,000 at the end of year three.
- The interest rate implicit in the lease is 10.19%.

The lessor classifies the lease as a finance lease.

The cost to the lessor of providing the machinery for lease consists of the book value of the machinery (£100,000), plus the initial direct costs associated with entering into the lease (£2,500), less the future income expected from disposing of the machinery at the end of the lease (the present value of the unguaranteed residual value of £10,000, being £7,475). This gives a cost of sale of £95,025.

The lessor records the following entries at the commencement of the lease:

Dr	Net investment in the lease	£150,000	
Dr	Cost of sales	£95,025	
	Cr	Inventory	£100,000
	Cr	Revenue	£142,525
	Cr	Creditors/cash (initial direct costs)	£2,500

The sales profit recognised by the lessor at the commencement of the lease is therefore £47,500 (£142,525 - £95,025). This is equal to the fair value of the machinery of £150,000, less the book value of the machinery (£100,000) and the initial direct costs of entering into the lease (£2,500). Revenue is equal to the net investment in the lease (£150,000), less the present value of the unguaranteed residual value (£7,475).

Lease payments received from the lessee will then be allocated over the lease term, as follows:

Year	Net investment in the lease at the start of the year (£)	Lease payments (£)	Interest income (10.19% per annum) (£)	Decrease in net investment in the lease (£)	Net investment in the lease at the end of the year (£)
	(a)	(b)	(c)	(d)=(b)-(c)	(e)=(a)-(d)
1	150,000	57,500	15,280	42,220	107,780
2	107,780	57,500	10,980	46,520	61,260
3	61,260	57,500	6,240	51,260	10,000

The lessor will record the following entries:

Year 1

Dr	Cash	£57,500	
	Cr	Lease receivable	£42,220
	Cr	Interest income	£15,280

Year 2

Dr	Cash	£57,500	
	Cr	Lease receivable	£46,520
	Cr	Interest income	£10,980

Year 3

Dr	Cash	£57,500	
	Cr	Lease receivable	£51,260
	Cr	Interest income	£6,240

At the end of the three-year lease term, the leased machinery will be returned to the lessor, who will record the following entries:

Dr	Inventory	£10,000	
	Cr	Lease receivable	£10,000

7.3.3 Subsequent measurement

Extract from FRS 102

20.101 A lessor shall recognise finance income over the lease term, based on a pattern reflecting a constant periodic rate of return on the lessor's net investment in the lease.

20.102 A lessor aims to allocate finance income over the lease term on a systematic and rational basis. A lessor shall apply the lease payments relating to the period against the gross investment in the lease to reduce both the principal and the unearned finance income.

After lease commencement, a lessor accounts for a finance lease, as follows:

- Recognises finance income (in profit or loss) over the lease term, based on a pattern reflecting a constant periodic rate of return on the lessor's net investment in the lease (i.e., using the interest rate implicit in the lease. [FRS 102.20.101].
- Applies the lease payments relating to the period against the gross investment in the lease to reduce both the principal and the unearned finance income. [FRS 102.20.102]. This means that the lessor reduces the net investment in the lease for lease payments received (net of finance income calculated above).
- Separately recognises income from variable lease payments that are not included in the net investment in the lease (e.g., performance- or usage-based variable payments) in the period in which that income is earned. [FRS 102.20.116(a)(iii)].

- Applies the relevant derecognition and impairment requirements, depending on the accounting policy choice made under paragraph 2 of Section 11 and Section 12 of FRS 102 (refer to Chapter 13). [FRS 102.20.103]. A lessor must regularly review estimated unguaranteed residual values used in computing the gross investment in the lease. If there has been a reduction in the estimated unguaranteed residual value, the lessor revises the income allocation over the lease term and recognises immediately any reduction in respect of amounts accrued (refer to 7.3.4 below). [FRS 102.20.103].

7.3.4 Unguaranteed residual values

Income recognition by lessors can be extremely sensitive to the amount recognised as the asset's residual value. This is because the amount of the residual value directly affects the computation of the amount of finance income earned over the lease term - this is shown in Illustration 7-4 below. Section 20 gives no guidance regarding the estimation of unguaranteed residual values, but it does require them to be reviewed regularly. If there has been a reduction in the estimated value, the income allocation over the lease term is revised and any reduction in respect of amounts accrued is recognised immediately. [FRS 102.20.103].

Illustration 7-4: Reduction in residual value

At lease commencement, the lessor accounts for the finance lease, as follows:

Details of a non-cancellable lease are:

- The asset has a fair value of £10,000
- The lessee is required to make five annual rentals payable in advance of £2,100
- The unguaranteed estimated residual value at the end of five years is £1,000

The lessor's direct costs have been excluded for simplicity.

Year	Net investment in lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period	Gross earnings allocated to future periods	Net investment in lease at end of period
	£	£	£	£	£	£
1	10,000	2,100	523	9,400	977	8,423
2	8,423	2,100	419	7,300	558	6,742
3	6,742	2,100	307	5,200	251	4,949
4	4,949	2,100	189	3,100	62	3,038
5	3,038	2,100	62	1,000	-	1,000
		10,500	1,500			

The gross investment in the lease at any point in time comprises the aggregate of the rentals receivable in future periods and the unguaranteed residual value, e.g., at the end of year 2, the gross investment of £7,300 is three years' rental of £2,100 plus the unguaranteed residual of £1,000. The net investment, which is the amount that will be recorded in the statement of financial position, is £7,300 less the earnings allocated to future periods of £558 = £6,742. The gross earnings allocated to future periods is the total finance income of £1,500 less the finance income already recognised.

The lessor concludes at the end of year 2 that the residual value of the asset is only £500 and revises the income allocation over the lease term accordingly at the original discount rate of 6.62%.

Year	Net investment in lease at start of period	Rental received	Finance income (6.62% per annum)	Gross investment at end of period*	Gross earnings allocated to future periods	Net investment in lease at end of period
	£	£	£	£	£	£
2	8,423	2,100	419	6,800	471	6,329
3	6,329	2,100	280	4,700	191	4,509
4	4,509	2,100	160	2,600	31	2,569
5	2,569	2,100	31	500	-	500

* The gross investment in the lease now takes account of the revised unguaranteed residual of £500, rather than the original £1,000.

The lessor will have to write off £413, being the difference between the carrying amount of the receivable and the revised balance above (£6,742 - £6,329). This is the present value as at the end of year 2 of £500 and represents the part of the unguaranteed residual written off.

7.3.5 Remeasurement of the net investment in the lease

After lease commencement, the net investment in a lease is remeasured when the following occurs:

- The lease is modified (i.e., a change in the scope of the lease, or the consideration for the lease, that was not part of its original terms and conditions), and the modified lease is not accounted for as a separate contract (refer to 7.5 below).
- The lease term is revised when there is a change in the non-cancellable period of the lease (refer to 5.4 above).

Or

- There is a change in the estimated unguaranteed residual value (refer to 7.3.4 above).

A lessor includes in its initial measurement of the net investment in the lease, variable lease payments that depend on an index or rate.

How we see it

Section 20 is silent on the accounting for any subsequent changes in future cash flows resulting from a change in an index or rate or variable lease payments becoming in-substance fixed. In the absence of further guidance, we believe lessors have an accounting policy choice regarding whether variable lease payments that depend on an index or rate are remeasured.

7.4 Operating leases

Under Section 20, lessors continue to recognise the underlying asset and do not recognise a net investment in the lease on the statement of financial position or initial profit (if any) in the income statement. The underlying asset continues to be accounted for in accordance with applicable accounting requirements (e.g., Section 17).

Lessors subsequently recognise lease payments as income over the lease term on a straight-line basis, unless either:

- Another systematic basis is more representative of the pattern in which benefit from the use of the underlying asset is diminishes.
- Or
- The lease payments are structured to increase in line with expected general inflation (based on published indices or statistics) to compensate for the lessor's expected inflationary cost increases. If the lease payments vary according to factors other than general inflation, then this condition is not met. [FRS 102.20.106].

Illustration 7-5: Lease payments containing fixed increments**Scenario A**

A lessor operates in a country in which the consensus forecast by local banks is that the general price level index, as published by the government, will increase by an average of 10% annually over the next five years. The lessor leases some office space to a lessee for five years under an operating lease. The lease payments are structured to reflect the expected 10% annual general inflation (cost and prices index (CPI)) over the five-year term of the lease as follows:

Year	Annual rental £
1	100,000
2	110,000
3	121,000
4	133,000
5	146,000

The lessor recognises annual lease income equal to the amounts charged to the lessee as shown above.

Scenario B

A lessor has entered into a lease under which the payments increase by 10% per annum, in order to correspond to the expected growth in the lessee's retail activity. The lease payments are the same as above. The increases in rental are not compensation for expected annual inflation. The lessor will recognise an annual lease income on a straight-line basis of £122,000 each year (the sum of the amounts payable under the lease divided by five years).

Scenario C

A lessor leases a property at an initial rent of £1,000,000 per annum. The lease has a non-cancellable term of 20 years and rent increases annually in line with the CPI of the country in which the property is situated but with a minimum increase of 2% and a maximum of 5% per annum. The estimated long-term rate of inflation in the country in question is 2.5%. The rental payment charged by the lessor, which will include a minimum increase of 2% per annum whatever the actual rate of inflation, will be recognised as income as incurred. The lessor will not be obliged to make a straight-line adjustment for the 2% minimum increase. The fixed minimum increment is considered to be a proxy for expected general inflation. It is reasonable to have a range rather than a single figure.

This analysis would be the same if the estimated long-term rate of inflation were some other figure within the range, e.g., 2% or 3%, as long as both the long-term rate and minimum and maximum increases were reasonable estimates in the circumstances of the country in question.

If the lessor pays the lessee an incentive to enter the lease, this is accounted for as described in 5.5.2 above. [FRS 102.20.106]. After lease commencement, lessors recognise variable lease payments that do not depend on an index or rate (e.g., performance- or usage- based payments) as they are earned.

[FRS 102.20.116].

A lessor recognises costs, including depreciation, incurred in earning the lease income as an expense. Section 20 also requires lessors of operating leases to defer initial direct costs at lease commencement and recognise them over the lease term on the same basis as lease income. [FRS 102.20.107, FRS 102.20.108].

The depreciation policy for depreciable underlying assets subject to operating leases must be consistent with the lessor's normal depreciation policy for similar assets. A lessor calculates depreciation in accordance with Section 17 or Section 18. [FRS 102.20.109]. A lessor applies Section 27 to determine whether an underlying asset subject to an operating lease is impaired and to account for any impairment loss identified. [FRS 102.20.110].

A manufacturer or dealer lessor does not recognise any selling profit on entering into an operating lease because it is not the equivalent of a sale. [FRS 102.20.111].

7.5 Lease modifications

If a finance lease is modified (i.e., there is a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and condition of the lease), the modification may result in:

- A separate lease (refer to 7.5.1.A below).

Or

- A change in the accounting for the existing lease (i.e., not a separate lease) (refer to 7.5.1.B below).

If an operating lease is modified, it is treated as a new lease from the effective date of the modification (refer to 7.5.2 below).

7.5.1 Modifications to a finance lease

7.5.1.A Determining whether a lease modification results in a separate lease

Extract from FRS 102

20.104 A lessor shall account for a modification to a finance lease as a separate lease if both:

- (a) the modification increases the scope of the lease by adding the right to use one or more underlying assets; and
- (b) the consideration for the lease increases by an amount commensurate with the stand-alone price for the increase in scope and any appropriate adjustments to that stand-alone price to reflect the circumstances of the particular contract. *[FRS 102.20.104].*

If both of these conditions are met, the lease modification results in two separate leases, the unmodified original finance lease and a separate lease. Lessors account for the separate lease in the same manner as other new leases. If either of the conditions is not met, the lease modification does not result in a separate lease.

7.5.1.B Lessor accounting for a modification that does not result in a separate lease

If a finance lease is modified and does not result in a separate lease, lessors account for the modification depending on the classification of the modified lease. If the lease would have been classified as an operating lease had the modification been in effect at the inception date, lessors account for such modifications as the creation of a new lease that commences on the effective date of the modification. The carrying amount of the underlying asset is measured as the net investment in the original lease immediately before the effective date of the modification. Otherwise, the net investment in the lease is accounted for in accordance with the relevant requirements of Section 11 and 12, IAS 39 or IFRS 9 depending on the accounting policy choice made under paragraph 2 of Section 11 and Section 12. *[FRS 102.10.105].*

7.5.2 Modification to an operating lease

If an operating lease is modified and the arrangement continues to be or contains a lease, it is treated as a new lease from the effective date of the modification, considering any prepaid or accrued lease payments relating to the original lease as part of the lease payments for the new lease. *[FRS 102.20.112].* Accounting for the new lease includes identifying and separating the lease and non-lease components of the contract (refer to 4.2 above).

Upon modification, the classification criteria are reassessed (refer to 7.1 above). As a result, the new lease may be an operating lease or a finance lease.

Illustration 7-6 shows how the modification guidance is applied for a concession that involves the forgiveness of future lease payments.

Illustration 7-6: Forgiveness of future lease payments on an operating lease

Restaurant A leases space in a shopping mall from Lessor B. Lessor B classifies the lease as an operating lease.

Under the terms of the lease, Restaurant A makes fixed lease payments of £100 to Lessor B at the beginning of each month. The non-cancellable lease term ends on 28 February 20X8. The contract does not include any non-lease components, extension, termination or purchase options.

All lease payments due up to 30 June 20X6 have been received in a timely manner. On 30 June 20X6, in compensation for the partial closure of the shopping mall for major refurbishment, Lessor B agrees to forgive Restaurant A's future lease payments for the months of July, August and September 20X6.

Analysis:

The rent concession results in a decrease in the total lease payments. Thus, there has been a change in the consideration for a lease that was not part of the original terms and conditions of the contract. Therefore, the rent concession constitutes a lease modification. The modification does not change the classification of the lease as an operating lease.

On the effective date of the modification (i.e., 30 June 20X6), Lessor B accounts for the modification as a new lease, as follows:

- The remaining lease payments under the modified lease comprise £1,700 (lease payments of £100 per month from October 20X6 to February 20X8).
- The remaining lease term is 20 months.
- The monthly operating lease income to be recognised over the remaining lease term is therefore $\text{£1,700} \div 20 \text{ months} = \text{£85}$.

In Illustration 7-6 above, lease payments had been received in a timely manner up until the date at which the lessor agreed to forgive specified future payments. If this had not been the case and the lessor agreed also to legally release the lessee from its obligations in respect of contractually due but not paid lease payments (i.e., those for which an operating lease receivable was recognised by the lessor), the lessor would apply the impairment and derecognition requirements of Section 11 and 12, IAS 39, or IFRS 9 to that operating lease receivable, depending on the accounting policy choice made under paragraph 2 of Section 11 and Section 12. [FRS 102.11.7(c), IAS 39.2, IFRS 9.2.1(b)]. (Refer to Chapter 13 for further discussion of impairment of financial assets). Therefore, in accounting for a rent concession in respect of an operating lease, a lessor applies:

- The derecognition requirements in Section 11 and 12, IAS 39 or IFRS 9 to forgiven lease payments that the lessor has recognised as an operating lease receivable.
- And
- The lease modification requirements in Section 20 to forgiven lease payments that the lessor has not recognised as an operating lease receivable.

This approach is consistent with conclusions reached by the IFRS IC in September 2022 when discussing the application of IFRS 16 and IFRS 9 to a fact pattern in which a rent concession is agreed by a lessor and a lessee, which changes the original terms and conditions of a lease contract that is classified by the lessor as an operating lease.¹¹⁰

7.6 Other lessor matters

7.6.1 Impairment of the net investment in the lease

Extract from FRS 102

20.103 A lessor shall apply the relevant derecognition and impairment requirements, depending on the accounting policy choice made under paragraphs 11.2 and 12.2, to the net investment in the lease. A lessor shall review regularly estimated unguaranteed residual values used in computing the gross investment in the lease. If there has been a reduction in the estimated unguaranteed residual value, the lessor shall revise the income allocation over the lease term and recognise immediately any reduction in respect of amounts accrued.

¹¹⁰ [IFRS - IFRIC Update September 2022](#)

Lessors evaluate their net investment in the lease for impairment by applying the relevant derecognition and impairment requirements of Section 11, Section 12, IAS 39 or IFRS 9, depending on the accounting policy choice made under paragraph 2 of Section 11 and Section 12. *[FRS 102.20.103]*.

7.6.2 Portfolio application

Section 20 specifies the accounting for an individual lease. However, as a practical expedient, an entity may apply it to a portfolio of leases with similar characteristics (e.g., a similar lease term for a similar class of underlying asset in a similar economic environment). If accounting for a portfolio, an entity uses estimates and assumptions that reflect the size and composition of the portfolio. *[FRS 102.20.13]*.

7.7 Presentation

Lessors recognise assets held under a finance lease in the statements of financial position and present them as a receivable at an amount equal to the net investment in the lease. *[FRS 102.20.93]*. In addition, lessors are required under Section 20 to present underlying assets subject to operating leases according to the nature of that asset in the statement of financial position. *[FRS 102.20.113]*.

The net investment in the lease is subject to the same considerations as other assets in classification as current or non-current assets in the statement of financial position (refer to Chapter 6).

7.8 Lessor disclosures

Extract from FRS 102

20.114 A lessor shall disclose a general description of its significant leasing arrangements, including, if necessary to enable users to understand those arrangements, information about variable lease payments, renewal or purchase options and escalation clauses, subleases, and restrictions imposed by lease arrangements.

20.115 If necessary to enable users to understand its significant leasing arrangements, a lessor shall disclose additional qualitative and quantitative information.

20.116 A lessor shall disclose the following amounts for the reporting period:

- (a) for finance leases:
 - (i) selling profit or loss;
 - (ii) finance income on the net investment in the lease; and
 - (iii) income relating to variable lease payments not included in the measurement of the net investment in the lease.
- (b) for operating leases, lease income, separately disclosing income relating to variable lease payments that do not depend on an index or a rate. *[FRS 102.114, FRS 102.115, FRS 102.116]*

In addition to the disclosure requirements of paragraphs 114 to 116 of Section 20 shown above, Section 20 also requires that:

For finance leases, a lessor must:

- Provide a qualitative and quantitative explanation of the significant changes during the reporting period in the carrying amount of the net investment in finance leases. *[FRS 102.20.117]*.
- Disclose a maturity analysis of the lease payments receivable, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years. A lessor must reconcile the undiscounted lease payments to the net investment in the lease. The reconciliation shall identify the unearned finance income relating to the lease payments receivable and any discounted unguaranteed residual value. A lessor also discloses the accumulated allowance for uncollectible lease payments receivable. *[FRS 102.20.118]*.

For operating leases, a lessor must:

- Apply the disclosure requirements of Section 17 for items of property, plant and equipment subject to an operating lease (refer to Chapter 20 at 3.10.1). In applying the disclosure requirements of Section 17, a lessor must disaggregate each class of property, plant and equipment into assets subject to operating leases and assets not subject to operating leases. Accordingly, a lessor provides the disclosures required by Section 17 for assets subject to an operating lease (by class of underlying asset) separately from owned assets held and used by the lessor. *[FRS 102.20.119]*.
- Apply the disclosure requirements in Section 16 (refer to Chapter 19 at 4.3), Section 18 (refer to Chapter 21 at 3.4), Section 27 (refer to Chapter 29 at 9), and Section 34 (refer to Chapter 36) for assets subject to operating leases. *[FRS 102.20.120]*.
- Disclose a maturity analysis of the lease payments receivable, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years. *[FRS 102.20.121]*.

8 Requirements of Section 20 for subleases

8.1 Definition

The term 'sublease' is not defined in Section 20 or in the FRS 102 glossary. However, the term is defined in IFRS 16 as "A transaction for which an underlying asset is re-leased by a lessee ('intermediate lessor') to a third party, and the lease ('head lease') between the head lessor and lessee remains in effect", [IFRS 16.Appendix A], and this is consistent with how the term is commonly understood.

Lessees often enter into arrangements to sublease a leased asset to a third party while the original lease contract is in effect. In these arrangements, one party acts as both the lessee and lessor of the same underlying asset. The original lease is often referred to as a head lease, the original lessee is often referred to as an intermediate lessor or sublessor, and the ultimate lessee is often referred to as the sublessee.

In some cases, the sublease is a separate lease agreement. In other cases, a third party assumes the original lease, but the original lessee remains the primary obligor under the original lease.

8.2 Intermediate lessor accounting

Extract from FRS 102

- 20.12** If a lessee subleases an asset, or expects to sublease an asset, the head lease does not qualify as a lease of a low-value asset.
- 20.92** In classifying a sublease, an intermediate lessor shall classify the sublease as a finance lease or an operating lease as follows:
- (a) if the head lease is a short-term lease that the entity, as a lessee, has accounted for applying paragraph 20.6, the sublease shall be classified as an operating lease.
 - (b) otherwise, the sublease shall be classified by reference to the right-of-use asset arising from the head lease, rather than by reference to the underlying asset (eg the item of property, plant or equipment that is the subject of the lease).

If an underlying asset is re-leased by a lessee to a third party and the original lessee retains the primary obligation under the original lease, the transaction is a sublease. That is, the original lessee generally continues to account for the original lease (the head lease) as a lessee and accounts for the sublease as the lessor (intermediate lessor).

When the head lease is a short-term lease, the sublease is classified as an operating lease. Otherwise, the sublease is classified using the classification criteria in 7.1.1 above by reference to the right-of-use asset in the head lease (and not the underlying asset of the head lease). [FRS 102.20.92].

Illustration 7-1: Classification of a sublease

Entity F (original lessee/intermediate lessor) leases a building for five years. The building has an economic life of 30 years. Entity F subleases the building for four years. The sublease is classified with reference to the right-of-use asset in the head lease (and not the underlying building). For example, when assessing the useful life criterion, the sublease term of four years is compared with five year right-of-use asset in the head lease and not with 30-year economic life of the building which may result in the sublease being classified as a finance lease.

The intermediate lessor accounts for the sublease as follows:

- If the sublease is classified as an operating lease, the original lessee continues to account for the lease liability and right-of-use asset on the head lease like any other lease (refer to 6 above). If the total remaining carrying amount of the right-of-use asset on the head lease exceeds the anticipated sublease income, this may indicate that the right-of-use asset associated with the head lease is impaired. A right-of-use asset is assessed for impairment under Section 27.
- If the sublease is classified as a finance lease, the original lessee derecognises the right-of-use asset on the head lease at the sublease commencement date and continues to account for the original lease liability in accordance with the lessee accounting model (refer to 6 above). The original lessee, as the sublessor, recognises a net investment in the sublease and evaluates it for impairment (refer to 7.6.1 above).

In a sublease, an intermediate lessor may use the discount rate for the head lease (adjusted for any initial direct costs associated with the sublease) to measure the net investment in the sublease, if the interest rate implicit in the lease cannot be readily determined. [FRS 102.20.94].

When contracts are entered into at or near the same time, an intermediate lessor is required to consider the criteria for combining contracts (e.g., when the contracts are negotiated as a package with a single commercial objective, or when the consideration to be paid in one contract depends on the price or performance of the other contract). If the contracts are required to be combined, the intermediate lessor accounts for the head lease and sublease as a single combined transaction (refer to 4.3 above).

An intermediate lessor who subleases, or expects to sublease an asset, cannot account for the head lease as a lease of a low-value asset even when the criteria, as discussed in 6.1.2 above, are satisfied.

Section 20 does not provide examples of the application of the subleasing requirements. The following two Illustrations have been based on illustrative examples included in IFRS 16, and provide examples of applying the requirements to an intermediate lessor that enters into a head lease and a sublease of the same underlying asset. [IFRS 16.IE8, IFRS 16.IE Example 20, IFRS 16.IE Example 21].

Illustration 8-1: Accounting for a sublease by an intermediate lessor

Scenario A

An intermediate lessor enters into a five-year lease for 5,000 square metres of office space (the head lease) with Entity A (the head lessor). At the beginning of Year 3, the intermediate lessor subleases the 5,000 square metres of office space for the remaining three years of the head lease to a sublessee.

Analysis: The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as a finance lease, having considered the requirements in FRS 102.20.86-91. It is noted in this case that as the sublease is for the entire remaining term of the headlease.

When the intermediate lessor enters into the sublease, the intermediate lessor:

- Derecognises the right-of-use asset relating to the head lease that it transfers to the sublessee and recognises the net investment in the sublease.
- Recognises any difference between the right-of-use asset and the net investment in the sublease in profit or loss.

And

- Retains the lease liability relating to the head lease in its statement of financial position, which represents the lease payments owed to the head lessor.

During the term of the sublease, the intermediate lessor recognises both finance income on the sublease and interest expense on the head lease.

Scenario B

An intermediate lessor enters into a five-year lease for 5,000 square metres of office space (the head lease) with Entity A (the head lessor). At commencement of the head lease, the intermediate lessor subleases the 5,000 square metres of office space for two years to a sublessee.

Analysis: The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as an operating lease, having considered the requirements in FRS 102.20.86-91. In this case, it is noted that the sublease is entered into at the beginning of the term of the headlease and is for a period of two years. Therefore the term of the sublease is not for the major part of the economic life of the right-of-use asset.

When the intermediate lessor enters into the sublease, the intermediate lessor retains the lease liability and the right-of-use asset relating to the head lease in its statement of financial position.

During the term of the sublease, the intermediate lessor:

- Recognises a depreciation charge for the right-of-use asset and interest on the lease liability.
- And
- Recognises lease income from the sublease.

8.3 Sublessee accounting

A sublessee accounts for its lease in the same manner as any other lease (i.e., as a new lease subject to Section 20's recognition and measurement provisions) (refer to 6 above).

8.4 Presentation

Following paragraph 96 of Section 2, an entity cannot offset assets and liabilities or income and expenses, unless required or permitted by FRS 102. [FRS 102.2.96]. Therefore, intermediate lessors are not permitted to offset lease liabilities and lease assets that arise from a head lease and a sublease, respectively, unless those liabilities and assets meet the requirements in FRS 102 for offsetting. Similarly, intermediate lessors are not permitted to offset depreciation and interest expenses and lease income relating to a head lease and a sublease of the same underlying asset, respectively, unless the requirements for offsetting in FRS 102 are met. For example, intermediate lessors apply the principal-versus-agent application guidance in Section 23 to determine whether sublease revenue needs to be presented on a gross or net basis (i.e., reduced for head lease expenses).

How we see it

We believe that intermediate lessors generally will not meet the requirements in Section 23 to present sublease income on a net basis and therefore, will generally present sublease revenue on a gross basis.

8.5 Disclosure

Under Section 20, entities including intermediate lessors are required to disclose a general description of its significant leasing arrangements, which, if necessary to enable users to understand those arrangements must include information about subleases. There are also specific lessor and lessee disclosure requirements which apply equally to intermediate lessors (refer to 6.8 for lessees and 7.8 for lessors, respectively).

9 Requirements of Section 20 for sale and leaseback transactions

Extract from FRS 102

20.122 If an entity (the seller-lessee) transfers an asset to another entity (the buyer-lessor) and leases that asset back from the buyer-lessor, both the seller-lessee and the buyer-lessor shall account for the transfer contract and the lease applying paragraphs 20.123 to 20.126.

[FRS 102.20.122]

A sale and leaseback transaction involves the transfer of an asset by an entity (the seller-lessee) to another entity (the buyer-lessor) and the leaseback of the same asset by the seller-lessee. Because Section 20 requires lessees to recognise most leases on the statement of financial position, sale and leaseback transactions may no longer provide lessees with a source of off-balance sheet financing. Both the seller-lessee and the buyer-lessor are required to apply Section 23 to determine whether to account for a sale and leaseback transaction as a sale and purchase of an asset.

The presentation in the statement of cash flows of sale and leaseback transactions is discussed in Chapter 7 at 3.8.4.

9.1 Determining whether the transfer of an asset is a sale

The accounting for a sale and leaseback transaction by both the buyer-lessor and the seller-lessee depends on whether the transfer of the asset by the seller-lessee satisfies the requirements of Section 23 to be accounted for as a sale of the asset. If control of an underlying asset passes to the buyer-lessor, the transaction is accounted for as a sale or purchase of the asset and a lease. If not, both the seller-lessee and the buyer-lessor account for the transaction as a financing transaction (in substance, the 'buyer' has provided finance to the 'seller' with the asset as security). Refer to Chapter 25 at 8 for determining when a performance obligation is satisfied under requirements of Section 23.

Section 23 includes the following to help entities determine whether control of the asset has been transferred. [FRS 102.23.78-FRS 102.23.80, FRS 102.23.85].

Extract from FRS 102

23.78 An entity shall recognise revenue when (or as) the entity satisfies a performance obligation by transferring a promised good or service (ie an asset) to a customer. A good or service is transferred when (or as) the customer obtains control of that good or service.

23.79 For each performance obligation identified, an entity shall determine at contract inception whether the performance obligation is satisfied over time (in accordance with paragraphs 23.81 to 23.84) or satisfied at a point in time (in accordance with paragraphs 23.85 to 23.89).

23.80 Goods and services are assets, even if only momentarily, when they are received and used (as in the case of many services). Control of an asset refers to the ability to direct the use of, and obtain substantially all of the remaining economic benefits that may flow from, the asset.

Performance obligations satisfied at a point in time

23.85 If a performance obligation is not satisfied over time, an entity satisfies the performance obligation at a point in time. To determine the point in time at which a customer obtains control of a promised asset, an entity shall consider indicators of the transfer of control, which include but are not limited to, the following:

- (a) the entity has a present right to payment for the asset;
- (b) the customer has legal title to the asset;
- (c) the entity has transferred physical possession of the asset;
- (d) the customer has the significant risks and rewards of ownership of the asset; and
- (e) the customer has accepted the asset (see paragraphs 23.88 to 23.89).

None of the indicators above individually determine whether the buyer-lessor has obtained control of the underlying asset. Both the seller-lessee and the buyer-lessor must consider all relevant facts and circumstances to determine whether control has transferred. Furthermore, not all of the indicators must be present to determine that the buyer-lessor has gained control. Rather, the indicators are factors that are

often present when a customer has obtained control of an asset, and the list is meant to help entities apply the principle of control (refer to Chapter 25).

In considering whether a transaction should be accounted for as a sale and leaseback transaction, an entity should consider not only those transactions structured in the form of a legal sale and leaseback, but should also consider other forms of transactions for which the economic effect is the same as a legal sale and leaseback.

It should be noted that the existence of a leaseback, in isolation, does not preclude a sale. This is because a lease is different from the sale or purchase of an underlying asset, as a lease does not transfer control of the underlying asset. Instead, it transfers the right to control the use of the underlying asset for the period of the lease.

When assessing whether a customer obtains control of an asset, entities are required to consider any repurchase agreements. [FRS 102.23.90]. Under Section 23, if a selling entity has an obligation or a right to repurchase an asset (a forward or a call option), the selling entity cannot recognise revenue as the customer has not obtained control of the asset. In such a case, the entity is required to account for the contract as either:

- A lease in accordance with Section 20 if the entity can or must repurchase the asset for an amount that is less than the original selling price of the asset. As an exception, the entity shall account for the contract in accordance with the general sale and leaseback requirements in paragraph 122 of Section 20 if the contract forms part of a sale and leaseback transaction.
- Or
- A financing arrangement if the entity can or must repurchase the asset for an amount that is equal to or more than the original selling price of the asset. [FRS 102.23.92].

Since paragraph 92 of Section 23 specifies that where the seller has a forward or call option, the customer does not obtain control of the asset, applying the sale and leaseback requirements under paragraph 122 of Section 20, the entity would account for the transaction as a transfer that does not result in a sale, under paragraph 126 of Section 20 (refer to 9.3 below).

9.2 Transactions in which the transfer of an asset is a sale

Extract from FRS 102

Transfer of the asset is a sale

- 20.123** If the transfer of an asset by the seller-lessee satisfies the requirements of Section 23 to be accounted for as a sale of the asset:
- (a) the seller-lessee shall make an accounting policy choice, which it shall apply consistently, to either:
 - i. measure the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee shall recognise only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor; or
 - ii. measure the right-of-use asset arising from the leaseback in accordance with paragraph 20.46, with any excess of the sale proceeds over the previous carrying amount of the asset deferred, and amortised over the lease term, and any shortfall of the sales proceeds under the carrying amount recognised immediately in profit or loss
 - (b) the buyer-lessor shall account for the purchase of the asset applying other sections of this FRS, and for the lease applying the lessor accounting requirements in this section.
- 20.124** If the fair value of the consideration for the sale of an asset does not equal the fair value of the asset, or if the payments for the lease are not at market rates, an entity shall make the following adjustments to measure the sale proceeds at fair value:
- (a) any below-market terms shall be accounted for as a prepayment of lease payments; and
 - (b) any above-market terms shall be accounted for as additional financing provided by the buyer-lessor to the seller-lessee.
- 20.125** The entity shall measure any potential adjustment required by paragraph 20.124 on the basis of the more readily determinable of:
- (a) the difference between the fair value of the consideration for the sale and the fair value of the asset; and
 - (b) the difference between the present value of the contractual payments for the lease and the present value of payments for the lease at market rates.

[FRS 102.20.123, FRS 102.20.124, FRS 102.20.125]

9.2.1 Accounting for the sale

If the transfer of the asset is a sale, the seller-lessee has an accounting policy choice which it must apply consistently, to either:

- Measure the right-of-use asset at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Under this approach the seller-lessee recognises the amount of any gain or loss that relates to the rights transferred to the buyer-lessor in profit or loss (refer to 9.2.1.A below).
- Or
- Measure the right-of-use asset arising from the leaseback at cost in accordance with the general principles of initial measurement in paragraph 46 of Section 20 (refer to 6.2.1 above). Under this approach, any excess of the sale proceeds over the previous carrying amount of the asset is deferred and amortised to profit or loss over the lease term. Any shortfall of the sales proceeds under the carrying amount is recognised immediately in profit or loss (refer to 9.2.1.B below). [FRS 102.20.123(a)].

The first of the two options above is similar to the sale and leaseback requirements under IFRS 16. IFRS 16 does not offer an accounting policy choice, and therefore a GAAP difference arises between UK GAAP and IFRS where a UK GAAP reporter makes the policy choice to apply paragraph 123(a)(ii) of Section 20.

A buyer-lessor accounts for the purchase of the asset in accordance with other standards based on the nature of the asset (e.g., Section 17 for property, plant and equipment).

9.2.1.A Accounting for the sale – policy of measuring the right-of-use asset at the proportion of the previous carrying amount that relates to the right of use retained

If the transfer of the asset is a sale, and the seller-lessee makes the accounting policy choice to apply the requirements of paragraph 123(a)(i) of Section 20 to its sale and leaseback transactions, the seller-lessee will:

- Derecognise the underlying asset.
- Recognise the gain or loss, if any, that relates to the rights transferred to the buyer-lessor and adjust for off-market terms.

How we see it

Where a seller lessee takes the accounting policy choice to apply the requirements of paragraph 123(a)(i) of Section 20, the seller-lessee is required to measure the right-of-use asset from the leaseback at the portion of the previous carrying amount of the asset that relates to the right of use retained, but Section 20 does not prescribe how the portion retained should be measured. Therefore, judgement may be required to measure the portion retained. FRS 102 does not provide any examples of how this approach might be applied, but entities may refer to Examples 24 and 25 in IFRS 16 which show methodologies for determining the gain on sale. Refer to 9.2.4 below.

Frequently asked questions

Question 9-1: When the lease payments relating to a leaseback are totally variable and not based on an index or rate, how is 'the proportion of the previous carrying amount of the asset that relates to right-of-use retained by the lessee' determined?

The IFRS IC issued an agenda decision in June 2020 related to a sale and leaseback transaction with variable payments. Whilst IFRS IC agenda decisions do not apply directly to entities reporting under FRS 102, the following discussion and example may be useful to entities applying FRS 102 who are considering a similar fact pattern and have made the accounting policy choice to apply the requirements of paragraph 123(a)(i) of Section 20 to their sale and leaseback transactions.

In the transaction described in the request, an entity (seller-lessee) enters into a sale and leaseback transaction whereby it transfers an item of property to another entity (buyer-lessor) and leases the asset back for five years. The transfer of the property satisfies the requirements in IFRS 15 (which contains similar principles to Section 23) to be accounted for as a sale of the property. The amount paid by the buyer-lessor to the seller-lessee in exchange for the property equals the property's fair value at the date of the transaction. Payments for the lease (which are at market rates) include variable payments (not based on an index or rate), calculated as a percentage of the seller-lessee's revenue generated using the property during the five-year lease term. The seller-lessee has determined that the variable payments are not in-substance fixed payments as described in IFRS 16 (such payments are similarly not expected to be in-substance fixed payments under Section 20). The request asked how, in the transaction described, the seller-lessee measures the right-of-use asset arising from the leaseback and determines the amount of any gain or loss recognised at the date of the transaction.

The IFRS IC observed that the requirements applicable to the transaction described in the request are in paragraph 100 of IFRS 16. Paragraph 100 states that, "If the transfer of an asset by the seller-lessee satisfies the requirements of IFRS 15 to be accounted for as a sale of the asset: (a) the seller-lessee measures the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee shall recognise only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor." [IFRS 16.100]. This requirement is substantially the same as the requirement set out in paragraph 123(a)(i) of Section 20.

Consequently, to measure the right-of-use asset arising from the leaseback, the seller-lessee determines the proportion of the property transferred to the buyer-lessor that relates to the right of use retained. It does so by comparing, at the date of the transaction, the right of use it retains via the leaseback to the rights comprising the entire property. IFRS 16 (and similarly, Section 20 of FRS 102) does not prescribe a method for determining that proportion. In the transaction described in the request, the seller-lessee could determine the proportion by comparing, for example: (a) the present value of expected lease payments (including those that are variable and not based on an index or rate); with (b) the fair value of the property at the date of the transaction.

The gain or loss the seller-lessee recognises at the date of the transaction is a consequence of its measurement of the right-of-use asset arising from the leaseback. Because the right of use the seller-

lessee retains is not remeasured as a result of the transaction (it is measured as a proportion of the property's previous carrying amount), the amount of the gain or loss recognised relates only to the rights transferred to the buyer-lessor. Applying paragraph 53(i) of IFRS 16, the seller-lessee discloses gains or losses arising from sale and leaseback transactions. Disclosure of gains or losses arising from sale and leaseback transactions is also required by paragraph 80(g) of Section 20.

The seller-lessee also recognises a liability at the date of the transaction, even if all the payments for the lease are variable and do not depend on an index or rate. The initial measurement of the liability is a consequence of how the right-of-use asset is measured - and the gain or loss on the sale and leaseback transaction determined - applying paragraph 100(a) of IFRS 16 (or for a UK GAAP reporter, paragraph 123(a)(i) of Section 20).

The extract below provides an illustrative example included in the June 2020 IFRIC update. Given the similarities between the requirements of paragraph 100(a) of IFRS 16 and paragraph 123(a)(i) of Section 20, this example is expected to be equally informative for entities applying FRS 102.

Illustration 9-1: Sale and leaseback with variable payments - extract from June 2020 IFRIC update

Seller-lessee enters into a sale and leaseback transaction whereby it transfers an asset (PPE) to Buyer-lessor, and leases that PPE back for five years. The transfer of the PPE satisfies the requirements in IFRS 15 to be accounted for as a sale of the PPE.

The carrying amount of the PPE in Seller-lessee's financial statements at the date of the transaction is CU1,000,000, and the amount paid by Buyer-lessor for the PPE is CU1,800,000 (the fair value of the PPE at that date). All the payments for the lease (which are at market rates) are variable, calculated as a percentage of Seller-lessee's revenue generated using the PPE during the five-year lease term. At the date of the transaction, the present value of the expected payments for the lease is CU450,000. There are no initial direct costs.

Seller-lessee determines that it is appropriate to calculate the proportion of the PPE that relates to the right of use retained using the present value of expected payments for the lease. On this basis, the proportion of the PPE that relates to the right of use retained is 25%, calculated as CU450,000 (present value of expected payments for the lease) ÷ CU1,800,000 (fair value of the PPE). Consequently, the proportion of the PPE that relates to the rights transferred to Buyer-lessor is 75%, calculated as (CU1,800,000 – CU450,000) ÷ CU1,800,000.

Applying IFRS 16.100(a), Seller-lessee:

- Measures the right-of-use asset at CU250,000, calculated as CU1,000,000 (previous carrying amount of the PPE) × 25% (proportion of the PPE that relates to the right of use it retains).
- Recognises a gain of CU600,000 at the date of the transaction, which is the gain that relates to the rights transferred to Buyer-lessor. This gain is calculated as CU800,000 (total gain on sale of the PPE (CU1,800,000 - CU1,000,000)) × 75% (proportion of the PPE that relates to rights transferred to Buyer-lessor).

Applying IFRS 16.100(a), the right-of-use asset would not be measured at zero at the date of the transaction because zero would not reflect the proportion of the previous carrying amount of the PPE (CU1,000,000) that relates to the right of use retained by Seller-lessee.

At the date of the transaction, Seller-lessee accounts for the transaction as follows:

Dr	Cash	CU1,800,000	
Dr	Right-of-use asset	CU250,000	
	Cr	PPE	CU1,000,000
	Cr	Liability	CU450,000
	Cr	Gain on rights transferred	CU600,000

The IFRS IC concluded that the principles and requirements in IFRS 16, which are similar to those set out in Section 20, provide an adequate basis for an entity to determine, at the date of the transaction, the accounting for the sale and leaseback transaction described in the request and, therefore, decided not to add the matter to its standard-setting agenda.

How we see it

Although not explicitly stated in Section 20, we believe that if the sale and leaseback transaction is expected to result in a loss to the seller-lessee, that loss will not be deferred. In addition, the seller-lessee may also need to consider whether the underlying asset may have been impaired prior to the sale and leaseback transaction.

9.2.1.B Accounting for the sale – policy of measuring the right-of-use asset in accordance with FRS 102.20.46

If the transfer of the asset is a sale, and the seller-lessee makes the accounting policy choice to apply the requirements of paragraph 123(a)(ii) of Section 20 to its sale and leaseback transactions, the seller-lessee will:

- Derecognise the underlying asset.
And
- Defer any excess of the sales proceeds over the previous carrying amount of the asset, and amortise it to profit or loss over the lease term. Any shortfall of the sales proceeds under the carrying amount recognised immediately in profit or loss.

9.2.2 Accounting for the leaseback

When a sale occurs, both the seller-lessee and the buyer-lessor account for the leaseback in the same manner as any other lease (refer to 6 and 7 above, respectively), with adjustments for any off-market terms. Specifically, a seller-lessee recognises a lease liability and right-of-use asset for the leaseback.

9.2.3 Adjustment for off-market terms

The sale transaction and the ensuing lease are generally interdependent and negotiated as a package. Consequently, some transactions could be structured with a negotiated sales price that is above or below the asset's fair value and with lease payments for the ensuing lease that are above or below the market rates. These off-market terms could distort the gain or loss on the sale and the recognition of lease expense and lease income for the lease. To ensure that the gain or loss on the sale and the lease-related assets and liabilities associated with such transactions are neither understated nor overstated, Section 20 requires adjustments for any off-market terms of sale and leaseback transactions, on the more readily determinable basis of the difference between the fair value of the consideration for the sale and the fair value of the asset and the difference between the present value of the contractual payments for the lease and the present value of payments for the lease at market rates. [FRS 102.20.125].

When the sale price is less than the underlying asset's fair value or the present value of the lease payments is less than the present value of the market lease payments, using the more readily determinable basis, a seller-lessee recognises the difference as an increase to the sales price and the initial measurement of the right-of-use asset as a lease prepayment. When the sale price is greater than the underlying asset's fair value or the present value of the lease payments is greater than the present value of the market lease payments, using the more readily determinable basis, a seller-lessee recognises the difference as a reduction in the sales price and an additional financing received from the buyer-lessor. [FRS 102.20.124].

Buyer-lessors are also required to adjust the purchase price of the underlying asset for any off-market terms. Such adjustments are recognised as lease prepayments made by the seller-lessee or as additional financing provided to the seller-lessee. [FRS 102.20.125].

9.2.4 Illustrative Examples

Section 20 does not provide any examples of the accounting for sale and leaseback transactions. However, IFRS 16 provides two examples, Example 24 and Example 25 which illustrate how the accounting should be applied under IFRS 16. When considering the applicability of these examples to entities applying FRS 102, it is important to remember that IFRS 16 permits only one approach for the seller-lessee to measure the right-of-use asset in a sale and leaseback, which is aligned to the approach under paragraph 123(a)(i) of Section 20. Therefore, entities who have made an accounting policy choice to instead apply paragraph 123(a)(ii) of Section 20 would not follow the approach illustrated in those examples included in IFRS 16.

Illustration 9-2 provides a simple example of the application of the accounting requirements for a sale and leaseback under each of the policy choices available under Section 20:

Illustration 9-2: Sale and leaseback transaction which qualifies as a sale

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of £1,500,000, which is equal to the fair value of the building. Immediately before the transaction, the building is carried at a cost of £1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 10 years, with annual payments of £130,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of Section 23 to be accounted for as a sale of the building. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback. The interest rate implicit in the lease is 3.5 per cent per annum, which is readily determinable by Seller-lessee.

Scenario A: Seller-lessee has made the accounting policy choice to apply FRS 102.20.123(a)(i) when accounting for sale and leaseback transactions.

The present value of the annual payments (10 payments of £130,000, discounted at 3.5 per cent per annum) is £1,081,159.

Buyer-lessor classifies the lease of the building as an operating lease.

Seller-lessee

Applying paragraph 20.123(a)(i), at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee.

Seller-lessee determines the proportion of the asset it retains to be 72.1% by comparing the present value of the lease payments with the fair value of the property at the date of the transaction ($£1,081,159 \div £1,500,000$). Therefore, it calculates the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee as £720,773.

Seller-lessee recognises only the amount of the gain that relates to the rights transferred to Buyer-lessor of £139,614, calculated as follows. The total gain on sale of the building amounts to £500,000 ($£1,500,000 - £1,000,000$), of which:

- £360,386 ($£500,000 \times £1,081,159 \div £1,500,000$) relates to the right to use the building retained by Seller-lessee.

And

- £139,614 ($£500,000 \times (£1,500,000 - £1,081,159) \div £1,500,000$) relates to the rights transferred to Buyer-lessor.

At the commencement date, Seller-lessee accounts for the transaction, as follows:

Cash	£1,500,000
Right-of-use asset	£720,723
Building	£1,000,000
Lease liability	£1,081,159
Gain on rights transferred	£139,614

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction, as follows:

Building	£1,500,000
Cash	£1,500,000

Scenario B: Seller-lessee has made the accounting policy choice to apply FRS 102.20.123(a)(ii) when accounting for sale and leaseback transactions.

The present value of the annual payments (10 payments of £130,000, discounted at 3.5 per cent per annum) is £1,081,159.

Buyer-lessor classifies the lease of the building as an operating lease.

Seller-lessee

Applying paragraph 20.123(a)(ii), at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at cost using the general principles of initial measurement in accordance with paragraph 46 of Section 20. In this example, the cost of the right-of-use asset is equal to the amount of the initial measurement of the lease liability as none of the other components of cost set out in paragraph 20.47(b)-(e) are relevant (i.e., there are no initial direct costs, dismantling costs, lease payments made in advance or lease incentives). As such, the seller-lessee measures the right-of-use asset arising from the leaseback at £1,081,159, an amount equal to the lease liability.

The total excess of the sales proceeds over the previous carrying amount of the asset is £500,000 (£1,500,000 - £1,000,000). This amount is deferred and amortised over the lease term.

At the commencement date, Seller-lessee accounts for the transaction, as follows:

Cash	£1,500,000	
Right-of-use asset	£1,081,159	
Building		£1,000,000
Lease liability		£1,081,159
Deferred income		£500,000

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction, as follows:

Building	£1,500,000	
Cash		£1,500,000

The following Illustration has been based on IFRS 16 Example 24 and illustrates the approach to accounting for a lease at above market terms for an entity applying paragraph 123(a)(i) of Section 20: [IFRS 16.IE11, IFRS 16.IE Example 24]

Illustration 9-3: Sale and leaseback transaction with fixed payments and above-market terms - entity applying FRS 102.20.123(a)(i) (based on IFRS 16.IE Example 24)

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of £2,000,000. Immediately before the transaction, the building is carried at a cost of £1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of £120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of Section 23 to be accounted for as a sale of the building. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback.

Seller-lessee has made the accounting policy choice to apply FRS 102.20.123(a)(i) when accounting for sale and leaseback transactions.

Analysis: The fair value of the building at the date of sale is £1,800,000. Because the consideration for the sale of the building is not at fair value, Seller-lessee and Buyer-lessor make adjustments to measure the sale proceeds at fair value. Applying paragraph 124(b) of Section 20, the amount of the excess sale price of £200,000 (£2,000,000 - £1,800,000) is recognised as additional financing provided by Buyer-lessor to Seller-lessee.

The interest rate implicit in the lease is 4.5 per cent per annum, which is readily determinable by Seller-lessee. The present value of the annual payments (18 payments of £120,000, discounted at 4.5 per cent per annum) is £1,459,200, of which £200,000 relates to the additional financing and £1,259,200 relates to the lease-corresponding to 18 annual payments of £16,447 and £103,553, respectively.

Buyer-lessor classifies the lease of the building as an operating lease.

Seller-lessee

Applying paragraph 123(a)(i) of Section 20, at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee.

Seller-lessee determines the proportion of the asset it retains to be 69.995% by comparing the present value of the lease payments with the fair value of the property at the date of the transaction (£1,259,200 ÷ £1,800,000). Therefore, it calculates the proportion of the previous carrying amount of the building that relates to the right-of-use retained by Seller-lessee as £699,555.

Seller-lessee recognises only the amount of the gain that relates to the rights transferred to Buyer-lessor of £240,355 calculated as follows. The total gain on sale of the building amounts to £800,000 (£1,800,000 - £1,000,000), of which:

- £559,645 (£800,000 × £1,259,200 ÷ £1,800,000) relates to the right to use the building retained by Seller-lessee.
- And
- £240,355 (£800,000 × (£1,800,000 - £1,259,200) ÷ £1,800,000) relates to the rights transferred to Buyer-lessor.

At the commencement date, Seller-lessee accounts for the transaction, as follows:

Cash	£2,000,000	
Right-of-use asset	£699,555	
Building		£1,000,000
Lease liability		£1,259,200
Financial liability		£200,000
Gain on rights transferred		£240,355

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction, as follows:

Building	£1,800,000	
Financial asset	£200,000 (18 payments of CU16,447, discounted at 4.5 per cent per annum)	
Cash	£2,000,000	

After the commencement date, Buyer-lessor accounts for the lease by treating £103,553 of the annual payments of £120,000 as lease payments. The remaining £16,447 of annual payments received from Seller-lessee are accounted for as (a) payments received to settle the financial asset of £200,000 and (b) interest revenue.

The following Illustration sets out the accounting for the same fact pattern as Illustration 9-3 above for an entity who has instead made the accounting policy choice to apply paragraph 123(a)(ii) of Section 20.

Illustration 9-4: Sale and leaseback transaction with fixed payments and above-market terms - entity applying paragraph 123(a)(ii) of Section 20

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of £2,000,000. Immediately before the transaction, the building is carried at a cost of £1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of £120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of Section 23 to be accounted for as a sale of the building. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback.

Seller-lessee has made the accounting policy choice to apply paragraph 123(a)(ii) of Section 20 when accounting for sale and leaseback transactions.

Analysis: The fair value of the building at the date of sale is £1,800,000. Because the consideration for the sale of the building is not at fair value, Seller-lessee and Buyer-lessor make adjustments to measure the sale proceeds at fair value. Applying paragraph 124(b) of Section 20, the amount of the excess sale price of £200,000 (£2,000,000 - £1,800,000) is recognised as additional financing provided by Buyer-lessor to Seller-lessee.

The interest rate implicit in the lease is 4.5 per cent per annum, which is readily determinable by Seller-lessee. The present value of the annual payments (18 payments of £120,000, discounted at 4.5 per cent per annum) is £1,459,200, of which £200,000 relates to the additional financing and £1,259,200 relates to the lease-corresponding to 18 annual payments of £16,447 and £103,553, respectively.

Buyer-lessor classifies the lease of the building as an operating lease.

Seller-lessee

Applying paragraph 123(a)(ii) of Section 20, at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at cost using the general principles of initial measurement in accordance with paragraph 46 of Section 20. In this example, the cost of the right-of-use asset is equal to the amount of the initial measurement of the lease liability as none of the other components of cost set out in paragraphs 47(b)-(e) of Section 20 are relevant (i.e., there are no initial direct costs, dismantling costs, lease payments made in advance or lease incentives). As such, the seller-lessee measures the right-of-use asset arising from the leaseback at £1,259,200, an amount equal to the lease liability.

The total excess of the sales proceeds over the previous carrying amount of the asset is £800,000 (£1,800,000 - £1,000,000). This amount is deferred and amortised over the lease term.

At the commencement date, Seller-lessee accounts for the transaction, as follows:

Cash	£2,000,000
Right-of-use asset	£1,259,200
Building	£1,000,000
Lease liability	£1,259,200
Financial liability	£200,000
Deferred income	£800,000

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction, as follows:

Building	£1,800,000
Financial asset	£200,000 (18 payments of CU16,447, discounted at 4.5 per cent per annum)
Cash	£2,000,000

After the commencement date, Buyer-lessor accounts for the lease by treating £103,553 of the annual payments of £120,000 as lease payments. The remaining £16,447 of annual payments received from Seller-lessee are accounted for as (a) payments received to settle the financial asset of £200,000 and (b) interest revenue.

FAQ 9-1 above, provides an extract from the June 2020 IFRIC update which includes an illustrative example of how to account for a sale and leaseback transaction in which the payments for the leaseback are variable and do not depend on an index or rate. That Illustration would be relevant for those entities who have made the policy choice to apply paragraph 123(a)(i) of Section 20 in their accounting for sale and leaseback transactions. The following Illustration considers the accounting for a similar fact pattern, but for an entity who has instead made the accounting policy choice to apply paragraph 123(a)(ii) of Section 20.

Illustration 9-5: Sale and leaseback with variable payments - entity applying paragraph 123(a)(ii) of Section 20

Seller-lessee enters into a sale and leaseback transaction whereby it transfers a building to Buyer-lessor, and leases that building back for five years. The transfer of the building satisfies the requirements in Section 23 to be accounted for as a sale of the building.

The carrying amount of the building in Seller-lessee's financial statements at the date of the transaction is £1,000,000, and the amount paid by Buyer-lessor for the building is £1,800,000 (the fair value of the PPE at that date). All the payments for the lease (which are at market rates) are variable, calculated as a percentage of Seller-lessee's revenue generated using the building during the five-year lease term. At the date of the transaction, the present value of the expected payments for the lease is £450,000. There are no initial direct costs.

Seller-lessee has made the accounting policy choice to apply paragraph 123(a)(ii) of Section 20 when accounting for sale and leaseback transactions.

Analysis: Applying paragraph 123(a)(ii) of Section 20, at the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at cost using the general principles of initial measurement in accordance with paragraph 46 of Section 20. In this example, the cost of the right-of-use asset is equal to the amount of the initial measurement of the lease liability as none of the other components of cost set out in paragraphs 47(b)-(e) of Section 20 are relevant (i.e., there are no initial direct costs, dismantling costs, lease payments made in advance or lease incentives).

In this case, although the *expected* lease payments are £450,000, the variable payments are not in-substance fixed payments and nor are they dependent on an index or rate. As such, the initial measurement of the lease liability in such a lease is £nil, and therefore the right-of-use asset arising from the leaseback (measured at an amount equal to the lease liability) is also £nil.

The total excess of the sales proceeds over the previous carrying amount of the asset is £800,000 (£1,800,000 - £1,000,000). This amount is deferred and amortised over the lease term.

At the date of the transaction, Seller-lessee accounts for the transaction as follows:

Dr	Cash	£1,800,000	
	Cr	PPE	£1,000,000
	Cr	Deferred income	£800,000

These Illustrations (together with the example from the June 2020 IFRIC Update (refer to 9.2.1.A above) demonstrate that the accounting policy choice made for sale and leaseback transactions under paragraph 123(a) of Section 20 can significantly impact the accounting for a sale and leaseback under FRS 102.

9.3 Transactions in which the transfer of an asset is not a sale

If the transfer of an asset is not a sale, the seller-lessee accounts for the transaction as a financing transaction. The seller-lessee keeps the transferred asset subject to the sale and leaseback transaction on its statement of financial position and accounts for amounts received as a financial liability in accordance with the accounting policy choice it has made for its financial instruments under paragraph 2 of Section 11 and Section 12. The seller-lessee decreases the financial liability by the payments made less the portion considered interest expense.

If the transfer of an asset is not a sale, the buyer-lessor does not recognise the transferred asset and accounts for the amounts paid as a receivable in accordance with the accounting policy choice made for its financial instruments under paragraph 2 of Section 11 and Section 12. *[FRS 102.20.126].*

How we see it

A sale and leaseback transaction that includes a repurchase option is not expected to qualify as a sale under Section 23 and therefore is not accounted for as a sale and leaseback under Section 20. However, Section 20 does not explicitly specify whether a buyer and seller would reassess a failed sale when a repurchase option expires unexercised. We believe it is acceptable to reassess whether there is a sale (or purchase) in accordance with Section 23 in this scenario and if so, apply the sale and leaseback guidance in Section 20 at the time the control transfers to the buyer.

9.4 Disclosure

A seller-lessee is required to disclose the following information about sale and leaseback transactions:

- The lessee's reasons for sale and leaseback transactions and the prevalence of those transactions.
- Key terms and conditions of individual sale and leaseback transactions.
- Payments not included in the measurement of lease liabilities.
- The cash flow effect of sale and leaseback transactions in the reporting period.
- When relevant, the entity having made the accounting policy choice to apply paragraph 123(a)(ii) of Section 20 in respect of sale and leaseback transactions when the transfer of the asset is a sale.

[FRS 102.20.77(d)]

A seller-lessee is also required to disclose any gains and losses arising from sale and leaseback transactions under paragraph 80(g) of Section 20.

10 Requirements of Section 20 for leases: Business combinations

10.1 Acquiree in a business combination is a lessee

Extract from FRS 102

Leases in which the acquiree is the lessee

19.19A The acquirer shall recognise right-of-use assets and lease liabilities for leases identified in accordance with Section 20 *Leases* in which the acquiree is the lessee. The acquirer is not required to recognise right-of-use assets and lease liabilities for:

- (a) leases for which the lease term ends within 12 months of the acquisition date; or
- (b) leases for which the underlying asset is of low value (as described in Section 20).

The acquirer shall measure the lease liability at the present value of the remaining lease payments as if the acquired lease were a new lease at the acquisition date. The acquirer shall measure the right-of-use asset at the same amount as the lease liability, adjusted to reflect favourable or unfavourable terms of the lease when compared with market terms.

10.1.1 Initial measurement of a lease

Section 19 *Business Combinations and Goodwill* specifies the initial measurement requirements for leases that are acquired in a business combination.

The acquirer measures the acquired lease liability as if the lease contract were a new lease at the acquisition date. That is, the acquirer applies the initial measurement provisions of Section 20, using the present value of the remaining lease payments at the acquisition date. The acquirer follows the requirements for determining the lease term, lease payments and discount rate as discussed in 5 above. The discount rate is determined from the perspective of the acquiree, as the acquiree is the customer in the lease contract. However, the determination of the lessee's incremental borrowing rate or obtainable borrowing rate will take into account that the acquiree is now part of the new group. This is discussed further in 5.6.1 above.

The right-of-use asset is measured at an amount equal to the recognised liability, adjusted to reflect the favourable or unfavourable terms of the lease, relative to market terms. Because the off-market nature of the lease is captured in the right-of-use asset, the acquirer does not separately recognise an intangible asset or liability for favourable or unfavourable lease terms relative to market.

The acquirer is not required to recognise right-of-use assets and lease liabilities for leases with lease terms which end within 12 months of the acquisition date and leases for low-value assets.

10.1.2 Subsequent measurement of a lease

The subsequent measurement requirements for an acquired lease liability and right-of-use asset are the same as the requirements for any other existing lease arrangement.

10.2 Acquiree in a business combination is a lessor

Section 19 is silent on the accounting where the acquiree in a business combination is a lessor. However, Section 20 requires an acquirer to classify all leases as lessor as either finance or operating leases at the inception of the lease. Classification is only revisited if the terms of the contract have been modified in a manner that would change its classification. [FRS 102.20.91]. Therefore, the classification is not changed as a result of a business combination unless a lease is modified (refer to 6.5 above).

11 Requirements of Section 20 for leases: Periodic review 2024 Transitional Arrangements

The amendments to Section 20 arising from the Periodic Review 2024 apply for accounting periods beginning on or after 1 January 2026. Early application is permitted, provided that all amendments arising from the Periodic Review 2024 (except the new supplier finance arrangements disclosures – refer to Chapter 7 at 2.4) are applied at the same time. *[FRS 102.1.37]*.

11.1 Transition to the revised Section 20

11.1.1 Practical expedient: Definition of a lease on transition to the revised Section 20

As a practical expedient, an entity is not required to reassess whether a contract is, or contains, a lease at the date of initial application of the revised Section 20. Instead, the entity is permitted to apply the requirements of the revised Section 20 to contracts that were previously identified as containing a lease, and not to apply the requirements of the revised Section 20 to contracts that were not previously identified as containing a lease. If an entity chooses this practical expedient, it discloses that fact and applies the practical expedient to all of its contracts. *[FRS 102.1.45]*.

It is important to note that this practical expedient determines which existing contracts the new lease accounting model will apply to, and which will be accounted for under other sections of the standard. It does not allow the entity to continue to apply the old lease accounting model.

As the accounting for operating leases under Section 20 prior to applying the Periodic Review 2024 amendments was similar to the accounting for service contracts, entities may not always have focused on determining whether an arrangement is a lease or a service contract. Some entities may need to revisit assessments made under Section 20 prior to applying the Periodic Review 2024 amendments because, under the revised Section 20, most leases are recognised on lessee's balance sheets and the effects of treating an arrangement as a service instead of a lease may be material. The practical expedient in Section 1 Scope allows an entity not to reassess whether a contract contains a lease applied only to arrangements that were properly assessed under Section 20 prior to applying the Periodic Review 2024 amendments.

11.1.2 Disclosure requirements on transition to the revised Section 20

In the reporting period in which an entity first applies the revised Section 20, the entity is not required to disclose the information required by paragraphs 13(b) to (d) of Section 10 in relation to Section 20. The entity must, however, disclose the nature of the changes in accounting policy as required by paragraph 13(a) of Section 10.

In addition, the entity must disclose:

- For the current period, to the extent practicable, the amount of the adjustment to profit or loss for the effect of applying the revised Section 20.
- Or
- An explanation if it is impracticable to determine the amount of the adjustment to profit or loss for the effect of applying the revised Section 20. *[FRS 102.1.44]*.

A requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so. *[FRS 102 Appendix I]*.

Refer also to 11.2 and 11.3 below for further disclosures required on transition to the revised Section 20.

11.2 Lessee transition

When a lessee first applies the Periodic Review 2024 amendments, it must apply the revised Section 20 retrospectively, in accordance with paragraphs 47 to 50 of Section 1. *[FRS 102.1.46]*. However, the lessee does not restate comparative information. Instead, the lessee recognises the cumulative effect of initially applying the Periodic Review 2024 amendments to Section 20 as an adjustment to the opening balance of retained earnings (or other component of equity, as appropriate) at the date of initial application. *[FRS 102.1.47]*.

A lessee must also disclose a description of the transitional provisions it has applied. *[FRS 102.1.50]*.

11.2.1 IFRS 16 option

If calculations have been prepared for an entity's lease accounting for group reporting purposes under IFRS 16, it may use those carrying amounts of the lease liabilities and right-of-use assets to measure its lease liabilities and right-of-use assets under FRS 102 at the date of initial application of the revised Section 20. This option applies to leases previously classified as finance leases or as operating leases. If an entity chooses this practical expedient, it must disclose that fact and apply the practical expedient to all of its leases. [FRS 102.1.48].

In practice, entities may have intra-group leases for which calculations under IFRS 16 have not been prepared because the intra-group leases would have been eliminated on consolidation. As paragraph 48 of Section 1 requires that an entity choosing the IFRS 16 practical expedient must apply that expedient to all of its leases, it is unclear whether the existence of material intra-group leases for which IFRS 16 calculations have not been prepared would preclude an entity from applying the IFRS 16 option. The FRC has explained that calculations made "for the purposes of including the entity in consolidated financial statements prepared in accordance with IFRS Accounting Standards" would generally include calculations made which are then subsequently eliminated on consolidation, and so the existence of leases which are eliminated on consolidation would not necessarily preclude the use of the IFRS 16 option¹¹¹.

How we see it

The intent of the IFRS 16 option is to promote efficiency within groups, and the FRC has explained that the existence of leases which are eliminated on consolidation would not necessarily preclude the use of the IFRS 16 option. We therefore believe that where the IFRS 16 option is applied, it must be applied to all leases that could be in scope of the option, i.e., it must be applied to all leases for which carrying amounts have been calculated under IFRS 16 for group reporting purposes.

Any leases for which IFRS 16 carrying amounts have not been calculated for group reporting purposes must be measured in accordance with paragraphs 51 to 54 of Section 1 on initial application of the revised Section 20 for leases previously classified as operating leases, and paragraph 55 of Section 1 for leases previously classified as finance leases (see 11.2.2 and 11.2.3 below).

11.2.1.A Government grant or non-exchange transaction on initial application

As discussed at 6.2.1 above, some lease arrangements may contain a government grant or non-exchange transaction for a public benefit entity, for example when lease payments are significantly below market rents. The lessee is required to account for such incoming resources in accordance with the requirements of Section 24 *Government Grants* (when a lease component contains a government grant) or, for a public benefit entity, paragraphs PBE 34.63-PBE 34.74 (when a lease component contains a non-exchange transaction) by recognising the incoming resources as a contribution to the cost of the right-of-use asset. The resulting impact is that the carrying value of the right-of-use asset will be higher than the contractual lease payments would imply. [FRS 102.20.47(e), FRS 102.B20.16]. In the discussion that follows, reference to incoming resources from a government grant or non-exchange transaction for a public benefit entity, is referred to as a 'non-exchange component'. A related situation arises when an entity receives a monetary government grant, say in the form of cash, in respect of entering into a separate lease contract.

IFRS 16 does not provide specific guidance on accounting for leases containing a non-exchange component. In particular, it does not specifically require an entity to account for the incoming resources as a contribution to the right-of-use asset (together with a separate credit) as FRS 102 now does. Further, there are some differences between the recognition and measurement requirements of IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance* and Section 24 when accounting for a government grant, whether that arises from a non-exchange component in a lease contract with the government as lessor or a separate government grant in respect of a lease. The following discussion covers some of the issues that arise on transition when grants have been accounted for under IFRS in a manner that is different from the requirements of FRS 102:

¹¹¹ FRC FRS 102 factsheet 9 Initial application of the Periodic Review 2024 amendments (November 2024)

- Grants recognised under IFRS at nominal amount

Section 24 requires grants to be measured at the fair value of the asset received or receivable, unlike IAS 20 which permits non-monetary government grants to be recorded, alternatively, at a nominal amount. [FRS 102.24.5, IAS 20.23].

Where an entity chooses to apply the IFRS 16 option and has leases that contain a non-monetary non-exchange component (e.g., leases at below-market rates) that had been recognised at nominal amount under IFRS, paragraph 48 of Section 1 is silent as to whether the entity would adjust the right-of-use asset calculated under IFRS 16 to reflect the non-exchange component in the lease. [FRS 102.1.48].

A view that could be taken is that Section 1 does not require the entity to adjust the right-of-use asset calculated under IFRS 16 to reflect the non-exchange component. However, as there is no exemption in Section 1 relating to the recognition of the non-exchange component, an alternative view is that a lessee must comply with the requirements of Section 24 and adjust the right-of-use asset.

How we see it

In our view, lessees have an accounting policy choice when applying the IFRS 16 option of whether or not to adjust the right-of-use asset (that was calculated for the purpose of including the entity in consolidated IFRS financial statements) in the manner required under Section 20 and Section 24 of FRS 102 (as applicable). The policy adopted is applied consistently to all leases containing a non-exchange component.

The discussion above applies similarly to a public benefit entity in receipt of incoming resources from a non-exchange transaction applying Section 20 and Section 34.

- Grants recognised under IFRS which have been deducted from the right-of-use asset

IAS 20 permits government grants to be deducted from the related asset rather than being shown as deferred income. FRS 102 does not permit the deduction of the grant from the related asset. [IAS 20.24, FRS 102.24.5B, FRS 102.24.5G].

Where a lessee has received a monetary grant in respect of a lease contract which, in the consolidated financial statements in which the lessee is included, is deducted from the right-of-use asset as permitted by paragraph 24 of IAS 20, the right-of-use asset would be presented at an amount lower than would have been calculated under IFRS 16.

Where a lessee in these circumstances chooses to apply the IFRS 16 option, Section 1 is silent as to whether the entity would exclude the effect of this netting and present separately the government grant.

How we see it

We believe such an entity must gross up the right-of-use asset for the amount of the grant that was presented net. This is because paragraph 48 of Section 1 requires the lessee to recognise "...the carrying amount...of its lease liabilities and right-of-use assets calculated under IFRS 16 Leases...". The deduction of a government grant from a right-of-use asset in accordance with paragraph 24 of IAS 20 is a presentation matter, and in our view is not a calculation that arose under IFRS 16.

Furthermore, paragraph 96 of Section 2 does not permit the offsetting of assets and liabilities unless required or permitted by FRS 102 nor is this permitted by Sections 20 and 24.

The accounting for any non-exchange component would, therefore, follow the requirements of Section 24 (applying the accruals model or performance model under the lessee's existing accounting policy).

Illustration 11-1 below provides an example of how a lessee accounts for a monetary grant deducted from a right-of-use asset under IFRS.

Illustration 11-1: Monetary grant deducted from a right-of-use asset under IFRS

Entity A, which is an existing FRS 102 reporter, is included in the consolidated financial statements of its parent that is reporting under IFRS. It has been owned by its parent for many years.

On 1 January 2024 (which is also the lease commencement date), Entity A entered into a five-year lease of a property with a lessor. The annual lease payments are £1,000 (paid in advance). Entity A concluded that it cannot readily determine the interest rate implicit in the lease and calculated a right-of-use asset of £4,500* under IFRS 16 as at 1 January 2024, using its incremental borrowing rate of 5.56%. The government provided a cash grant of £2,500 to Entity A in relation to the leased property. The Group accounting policy under IAS 20 followed by Entity A is to deduct the grant in arriving at the carrying amount of the right-of-use asset so that the carrying amount of the right-of-use asset on 1 January 2024 after netting off is £2,000.

Under Section 24, Entity A applies the accruals model to the recognition of government grants and recognised cash and deferred income of £2,500 (released to income on a straight-line basis over the five-year lease term). [FRS 102.24.5G, FRS 102.24.5F].

The date of initial application of the Periodic Review 2024 amendments is 1 January 2026 and Entity A applies the IFRS 16 option. [FRS 102.1.48]. The carrying amount of the right-of-use asset in its parent's IFRS consolidated financial statements immediately before the date of initial application is £1,200[‡] and the lease liability is £2,845.^{††}

As stated above, we believe that the entity must exclude the effect of netting previously made under IFRS. Therefore, on the date of initial application, Entity A would recognise the right-of-use asset at the amount calculated under IFRS 16, being £2,700.^{**}

Because Entity A applies the accruals model under FRS 102, it has already recorded deferred income of £1,500[†] in its FRS 102 financial statements. The same amount of deferred income would continue to be recorded on initial application of the Periodic Review 2024 as the accruals model under Section 24 requires that grants relating to assets, including right-of-use assets, are recognised in income on a systematic basis over the expected useful life of the asset, [FRS 102.24.5F], which is judged to be the full five-year lease term.

The remaining debit entry of £145^{‡‡} would be adjusted in the opening balance of retained earnings, i.e., as of 1 January 2026. [FRS 102.1.47]. The journal entry is as follows:

Dr	Right-of-use asset ^{**}	£2,700	
Dr	Retained earnings ^{‡‡}	£145	
	Cr	Lease liability ^{††}	£2,845

Had Entity A used £1,200 (i.e., the IFRS carrying amount net of the grant element) rather than £2,700 as its right-of-use asset, there would be a reduction in retained earnings of £1,645 which is disproportionate. This is because while both IFRS and FRS 102 amounts debited cash when the grant was received, this was credited to deferred income under FRS 102 but to right-of-use asset under IFRS. Given that Section 24 requires the continued recognition of the deferred income, the right-of-use asset included in the IFRS consolidated financial statements needs to be grossed up by £1,500[†] to avoid double counting of credits.

* This is calculated as the present value of £1,000 annual payments made in advance over 5 years using the lessee's incremental borrowing rate of 5.56%.

** The carrying amount of right-of-use asset before deducting the grant calculated under IFRS 16 is £2,700 (£4,500 less £1,800 for two years of depreciation).

† The amount of grant not yet recognised in profit or loss is £1,500 (£2,500 less £1,000 for amount already recognised in income over the two years).

‡ This is £2,000 of initial amount of right-of-use asset after netting off the grant x 3/5 (based on three years remaining of a 5-year lease term).

†† This is calculated as the present value of £1,000 annual payments made in advance over 3 years (remaining period) using a discount rate of 5.56%.

‡‡ This remaining debit entry represents the cumulative difference between the straight-line recognition of an operating lease under the previous Section 20 and the interest expense and depreciation of right-of-use asset under IFRS 16 for the two years to 1 January 2026 (the initial application of the Periodic Review 2024 Amendments).

11.2.2 Leases previously classified as operating leases

If a lessee does not apply the IFRS 16 option explained in 11.2.1 above, at the date of initial application the lessee:

- Recognises a lease liability, measured at the present value of the remaining lease payments (refer to 5.5 above), discounted using the lessee's incremental borrowing rate or obtainable borrowing rate (refer to 5.6 above) for each lease at the date of initial application. A public benefit entity that is unable readily to determine either the interest rate implicit in the lease, or the lessee's incremental or obtainable borrowing rate for a lease, uses the rate of interest otherwise obtainable by the public benefit entity on deposits held with financial institutions (refer to 5.6.3 above). *[FRS 102.1.51(a)]*
- Recognises a right-of-use asset at an amount equal to the lease liability, adjusted by the amount of any prepaid or accrued lease payments relating to that lease recognised in the statement of financial position immediately before the date of initial application. The lessee uses the information readily available to it at the date of initial application to determine whether, at the commencement date or the date of the most recent lease modification, the lessor provided the lessee with incoming resources from a government grant or (for a public benefit entity only) a non-exchange transaction as described in paragraph 35 of Section 20 (refer to 6.2.1 above). If so, the lessee measures the non-exchange element at the date of initial application and adjust the right-of-use asset accordingly. *[FRS 102.1.51(b)]*
- Applies Section 27 to right-of-use assets at the date of initial application. Alternatively, a lessee may apply the practical expedient in paragraph 53(b) of Section 1, which allows a lessee to rely on its assessment of whether leases are onerous applying Section 21 immediately before the date of initial application. If a lessee chooses this practical expedient, the lessee adjusts the right-of-use asset at the date of initial application by the amount of any provision for onerous leases recognised in the statement of financial position immediately before the date of initial application.

A lessee is permitted to apply this practical expedient on a lease-by-lease basis. *[FRS 102.1.51(c), FRS 102.1.53]*

How we see it

We believe that even when the provision for an onerous lease immediately before the date of initial application is nil, a lessee is able to use the practical expedient that allows a lessee to rely on its assessment of whether a lease is onerous applying Section 21 immediately before the date of initial application and not perform an impairment review on that date.

- Derecognises any asset or liability previously recognised relating to favourable or unfavourable terms of an operating lease acquired as part of a business combination and adjusts the carrying amount of the right-of-use asset by a corresponding amount at the date of initial application. *[FRS 102.1.54]*.

Section 20 does not specify whether the lessee's incremental borrowing rate or obtainable borrowing rate at the date of initial application should be determined based on the original lease term or the remaining lease term. We believe that both approaches are acceptable.

How we see it

We believe that a lessee has an accounting policy choice to use either the original lease term or remaining lease term to determine the incremental borrowing rate or obtainable borrowing rate at the date of initial application of revised Section 20.

The policy chosen should be applied consistently and disclosed in the financial statements.

Notwithstanding the requirements of paragraph 51 of Section 1, set out above, for leases previously classified as operating leases, a lessee:

- Is not required to make any adjustments on transition for leases for which the underlying asset is of low value that will be accounted for applying paragraph 6 of Section 20 (refer to 6.1.2 above). The lessee accounts for those leases applying the revised Section 20 from the date of initial application.
- Is not required to make any adjustments on transition for leases previously accounted for as investment property using the fair value model in Section 16 (refer to Chapter 19). This may apply if, for example, an entity generates rental income from a property that it is itself leasing. The lessee accounts for the right-of-use asset and the lease liability arising from those leases applying Section 16 and the revised Section 20 from the date of initial application.
- Measures the right-of-use asset at fair value at the date of initial application for leases previously accounted for as operating leases and that will be accounted for as investment property from the date of initial application. The lessee accounts for the right-of-use asset and the lease liability arising from those leases applying Section 16 and the revised Section 20 from the date of initial application. *[FRS 102.1.52]*.

A lessee may use one or more of the following practical expedients when applying the Periodic Review 2024 amendments to leases previously classified as operating leases. A lessee is permitted to apply these practical expedients on a lease-by-lease basis:

- A lessee may apply a single discount rate to a portfolio of leases with reasonably similar characteristics (such as leases with a similar remaining lease term for a similar class of underlying asset in a similar economic environment).
- A lessee may rely on its assessment of whether leases are onerous applying Section 21 immediately before the date of initial application as an alternative to applying Section 27 to right-of-use assets at the date of initial application in line with paragraph 51(c) of Section 1 (see above).
- A lessee may choose not to apply the requirements in paragraph 51 of Section 1 (see above) to leases for which the lease term ends within 12 months of the date of initial application. In this case, the lessee shall:
 - Account for those leases in the same way as short-term leases as described in paragraph 6 of Section 20 (refer to 6.1.1 above).

And

 - Include the cost associated with those leases within the disclosure of short-term lease expense in the reporting period starting on the date of initial application.
- A lessee may use hindsight, such as in determining the lease term if the contract contains options to extend or terminate the lease. [FRS 102.1.53].

Section 20 does not provide detailed guidance on the use of hindsight. However, as discussed in Chapter 9 at 3.3.2, hindsight cannot be used when applying a new accounting policy, either in making assumptions about what management's intentions would have been in a prior period or estimating the amounts recognised, measured or disclosed in a prior period. Hence, retrospectively applying a new accounting policy requires distinguishing information that provides evidence of circumstances that existed on the prior period date(s) from that information which would have been available when the financial statements for that prior period(s) were authorised for issue. We would expect a similar distinction to apply when a lessee first applies the Periodic Review 2024 amendments, and believe that the use of hindsight does not apply to matters of fact such as changes to an index or rate.

How we see it

We believe that hindsight can be applied only to matters of judgement and estimates and therefore would not apply to matters of fact such as changes to an index or rate.

Having applied the IFRS 16 option in paragraph 48 of Section 1 (refer to 11.2.1 above), or paragraphs 51 to 54 of Section 1 (see above), a lessee subsequently applies the requirements of Section 20, as revised by the Periodic Review 2024 amendments. [FRS 102.1.49].

11.2.3 Leases previously classified as finance leases

Unless the entity applies the IFRS 16 option in paragraph 48 of Section 1 (refer to 11.2.1 above), for each lease previously classified as a finance lease, a lessee recognises a right-of-use asset and lease liability at the date of initial application at the carrying amount of the leased asset and finance lease liability immediately before that date, measured applying FRS 102 prior to the adoption of the Periodic Review 2024 amendments. The lessee subsequently applies the requirements of Section 20, as revised by the Periodic Review 2024 amendments. [FRS 102.1.55]. Depending on the circumstances of the lease, subsequent measurement of leases previously classified as finance leases may differ from how they would have been measured using the old lease accounting model (i.e., Section 20 prior to applying the Periodic Review 2024 amendments), for example if there are lease modifications after the date of initial application. This is because the old lease accounting model contained no specific guidance in respect of lease modifications, and so the accounting that would have been applied may have differed from that required by the revised Section 20.

11.3 Lessor transition

With the exception of subleases (refer to 11.3.1 below), a lessor does not make any adjustments on transition for leases in which it is a lessor, and accounts for those leases applying the revised Section 20 from the date of initial application. [FRS 102.1.56].

11.3.1 Subleases

An intermediate lessor (an entity that is both a lessee and a lessor of the same underlying asset):

- Reassesses subleases that were classified as operating leases prior to adoption of the Periodic Review 2024 amendments and are ongoing at the date of initial application, to determine whether each sublease should be classified as an operating lease or a finance lease applying the Periodic Review 2024 amendments. The intermediate lessor performs this assessment at the date of initial application on the basis of the remaining contractual terms and conditions of the head lease and sublease at that date.

And

- For subleases that were classified as operating leases prior to adoption of the Periodic Review 2024 amendments, but are classified as finance leases applying the Periodic Review 2024 amendments, accounts for the sublease as a new finance lease entered into at the date of initial application.

[FRS 102.1.57].

11.4 Sale and leaseback transactions

An entity does not reassess sale and leaseback transactions entered into before the date of initial application to determine whether the transfer of the underlying asset satisfies the requirements in Section 23, applying the Periodic Review 2024 amendments, to be accounted for as a sale. [FRS 102.1.58].

If a sale and leaseback transaction was previously accounted for as a sale and finance lease, unless it applies the IFRS 16 option in paragraph 48 of Section 1 (refer to 11.2.1 above), the seller-lessee:

- Accounts for the leaseback in the same way as it accounts for any other finance lease that exists at the date of initial application.

And

- Continues to amortise any gain or loss on sale over the lease term. [FRS 102.1.59].

If a sale and leaseback transaction was previously accounted for as a sale and operating lease, unless it applies the IFRS 16 option in paragraph 48 of Section 1, the seller-lessee:

- Accounts for the leaseback in the same way as it accounts for any other operating lease that exists at the date of initial application.

And

- Adjusts the leaseback right-of-use asset for any deferred gains or losses that relate to off-market terms recognised in the statement of financial position immediately before the date of initial application.

[FRS 102.1.60]

12 Summary of differences between Section 20 and IFRS

The differences between FRS 102 and IFRS in accounting for leases are set out below.

	FRS 102	IFRS
Scope - Leases with non-typical contractual terms	Certain leases are excluded from the scope of Section 20 and instead classified as financial instruments within scope of Section 12 if the lease could, as a result of non-typical contractual terms, result in a loss to the lessor or the lessee.	IFRS 16 does not contain a similar scope exemption.
Lessee recognition exemptions - Low value assets	Similar to IFRS 16 with an optional low-value lease exemption available on a lease-by-lease basis, however, FRS 102 provides examples of assets that are not low-value.	Optional low value lease exemption available on a lease-by-lease basis. IFRS 16 does not provide examples of assets that are not low-value, instead only provides examples of low-value assets in the Basis for Conclusions.
Lessee discount rate	An additional option is provided on determining the discount rate when compared to IFRS 16. If the interest rate implicit in the lease, cannot be readily determined, the lessee chooses on a lease-by-lease basis to apply either the lessee's incremental borrowing rate or the lessee's obtainable borrowing rate. If a public benefit entity is unable to readily determine any of the three discount rates mentioned above, they should use the rate of interest on deposits held with financial institutions.	Discount rate applied to measure lease liability is the interest rate implicit in the lease, if the rate can be readily determined. If not, the lessee's incremental borrowing rate is used.
Lessee accounting for leases containing a non-exchange component	A lessee in receipt of incoming resources from a government grant or, for a public benefit entity with a non-exchange component, recognises the incoming resources as part of the right-of-use asset. The incoming resources are measured applying Section 24 or Section 34.	No specific guidance provided on leases containing a non-exchange component.
Lessee accounting - Disclosures	Similar detailed disclosures to IFRS 16. However, lease liability maturity analysis is not a prescribed disclosure in Section 20. Instead, the Regulations require, for an aggregate of all Creditors, disclosure of amounts payable after 5 years. Lease commitment disclosed separately for short-term leases and low value leases. No requirement to present all lease disclosures in a single note or separate section of the financial statements.	IFRS 16 contains a disclosure objective and detailed disclosure requirements including both quantitative and qualitative disclosures. No prescribed time brackets for the maturity analysis of lease liabilities. Lease commitment disclosure is required for short-term leases committed at the reporting date if the portfolio of leases is dissimilar to the portfolio of short-term lease expense incurred in the period. In addition to detailed disclosure requirements, lessees are required

FRS 102		IFRS
		to disclose additional qualitative and quantitative information necessary to meet the disclosure information within the standard. Lessees must present all disclosures required by IFRS 16 in a single note or separate section in the financial statements.
Lessor accounting - Straight-line basis for lease payments	If lease payments increase annually by fixed increments intended to compensate for expected annual inflation over the lease period, the fixed minimum increment that reflects expected general inflation will be recognised as income as incurred. Otherwise, similar to IFRS.	All operating lease receipts are recognised as income on a straight-line basis, unless another systematic basis is more appropriate.
Lessor accounting - Disclosures	Similar to IFRS 16. In addition to specific disclosure requirements, a lessor should disclose additional qualitative and quantitative information to enable users to understand its significant leasing arrangements. There is no specific requirement to include information that helps users to assess the nature of the lessor's leasing activities, and how the lessor manages the risk associated with any rights it retains in underlying assets.	Maturity analysis of lease payments under finance and operating leases showing undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years. A lessor discloses additional qualitative and quantitative information about its leasing activities necessary to meet the disclosure objective. This includes information that helps users to assess the nature of the lessor's leasing activities, and how the lessor manages the risk associated with any rights it retains in underlying assets.
Portfolio application	Similar to IFRS 16, except no reference is made to materiality, but instead provides examples of leases with similar characteristics as those with a similar lease term for a similar class of underlying asset in a similar economic environment.	IFRS 16 specifies the accounting for an individual lease, but provides a practical expedient that permits an entity to apply the standard to a portfolio of leases with similar characteristics, only if the accounting would not materially differ. If accounting for a portfolio, an entity uses estimates and assumptions that reflect the size and composition of the portfolio.
Lease modifications	For a lease modification that does not give rise to a separate lease, FRS 102 permits the lessee to use an unchanged discount rate in some circumstances.	When a lease is modified and the modification does not give rise to a new lease, the lessee remeasures the lease liability using a revised discount rate at the effective date of the lease modification.

FRS 102		IFRS
Sale and leaseback accounting	For a seller-lessee in a sale and leaseback transaction, if the transfer of the underlying asset satisfies the requirements of Section 23 to be accounted for as a sale, a policy choice exists in determining the measurement of the resulting right-of-use asset and the treatment of the gains or losses arising from the leaseback - either applying a similar principle to IFRS 16, or measuring the right-of-use asset arising from the leaseback at cost.	If the transfer of the underlying asset satisfies the requirements of IFRS 15 to be accounted for as a sale in a sale and leaseback transaction, the transaction will be accounted for as a sale and leaseback by both the seller-lessee and buyer-lessor. The seller-lessee measures the right-of-use asset from the leaseback at the portion of the previous carrying amount of the asset that relates to the right of use retained.

Appendix A – Defined terms

Extract from FRS 102

Appendix I

Glossary

class of [underlying] assets	A grouping of [underlying] assets of a similar nature and use in an entity's operations.
commencement date (of a lease)	The date on which a lessor makes an underlying asset available for use by a lessee.
contract	An agreement between two or more parties that creates enforceable rights and obligations.
depreciation	The systematic allocation of the depreciable amount of an asset over its useful life.
effective date of the modification	The date when both parties agree to a lease modification.
finance lease	A lease that transfers substantially all the risks and rewards incidental to ownership of an asset. Title may or may not eventually be transferred. A lease that is not a finance lease is an operating lease.
government grant	Government assistance in the form of a transfer of resources to an entity in return for past or future compliance with specified conditions relating to the operating activities of the entity.
gross investment in a lease	The aggregate of: (a) the lease payments receivable by the lessor under a finance lease; and (b) any unguaranteed residual value accruing to the lessor
inception date	The earlier of the date of the lease agreement and the date of commitment by the parties to the principal terms and conditions of the lease.
initial direct costs	Incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained, except for such costs incurred by a manufacturer or dealer lessor in connection with a finance lease.
interest rate implicit in the lease	The rate of interest that causes the present value of: (a) the lease payments; and (b) the unguaranteed residual value to equal the sum of: (i) the fair value of the underlying asset; and (ii) any initial direct costs of the lessor.
lease	A contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.
lease incentives	Payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee.
lease modification	A change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease (eg adding or terminating the right to use one or more underlying assets, or extending or shortening the contractual lease term).

lease payment	Payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term, comprising the following: (a) fixed payments (including in-substance fixed payments), less any lease incentives; (b) variable lease payments that depend on an index or a rate; (c) the exercise price of a purchase option if the lessee is reasonably certain to exercise that option; and (d) payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease. For the lessee, lease payments also include amounts expected to be payable by the lessee under residual value guarantees. Lease payments do not include payments allocated to non-lease components of a contract, unless the lessee elects to combine non-lease components with a lease component and to account for them as a single lease component. For the lessor, lease payments also include any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. Lease payments do not include payments allocated to non-lease components.
lease term	The aggregate of: (a) the non-cancellable period of a lease; (b) periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option; and (c) periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option.
lessee's incremental borrowing rate	The rate of interest a lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment.
lessee's obtainable borrowing rate	The rate of interest a lessee would have to pay to borrow, over a similar term, an amount similar to the total undiscounted value of lease payments to be included in the measurement of the lease liability.
net investment in a lease	The gross investment in a lease discounted at the interest rate implicit in the lease.
non-exchange transaction	A transaction whereby an entity receives value from another entity without directly giving approximately equal value in exchange, or gives value to another entity without directly receiving approximately equal value in exchange.
operating lease	A lease that does not transfer substantially all the risks and rewards incidental to ownership. A lease that is not an operating lease is a finance lease.
period of use	The total period of time that an asset is used to fulfil a contract with a customer (including any non-consecutive periods of time).
present value	A current estimate of the present discounted value of the future net cash flows in the normal course of business.
public benefit entity	An entity whose primary objective is to provide goods or services for the general public, community or social benefit and where any equity is provided with a view to supporting the entity's primary objectives rather than with a view to providing a financial return to equity providers, shareholders or members. ¹¹²
residual value guarantee	A guarantee made to a lessor by a party unrelated to the lessor that the value (or part of the value) of an underlying asset at the end of a lease will be at least a specified amount.

right-of-use-asset	An asset that represents a lessee's right to use an underlying asset for the lease term.
short term lease	A lease that, at the commencement date, has a lease term of 12 months or less. A lease that contains a purchase option is not a short-term lease.
underlying asset	An asset that is the subject of a lease, for which the right to use that asset has been provided by a lessor to a lessee.
unearned finance income	The difference between: (a) the gross investment in a lease; and (b) the net investment in a lease
unguaranteed residual value	That portion of the residual value of the underlying asset, the realisation of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

112 The term 'public benefit entity' does not necessarily imply that the purpose of the entity is for the benefit of the public as a whole. For example, many PBEs exist for the direct benefit of a particular group of people, although it is possible that society as a whole also benefits indirectly. The important factor is what the primary purpose of such an entity is, and that it does not exist primarily to provide economic benefit to its investors. Organisations such as mutual insurance companies, other mutual co-operative entities and clubs that provide dividends or other economic benefits directly and proportionately to their owners, members or participants are not PBEs. Some PBEs undertake certain activities that are intended to make a surplus in order to fund their primary activities. Consideration should be given to the primary purpose of an entity's (or group's) activities in assessing whether it meets the definition of a PBE.

PBEs may have received contributions in the form of equity, even though the entity does not have a primary profit motive. However, because of the fundamental nature of public benefit entities, any such contributions are made by the equity holders of the entity primarily to enable the provision of goods or services to beneficiaries rather than with a view to a financial return for themselves. This is different from the position of lenders; loans do not fall into the category of equity.

Overview

This chapter addresses Section 21 *Provisions and Contingencies*. Section 21 prescribes the recognition criteria, measurement basis and disclosure requirements to be applied to provisions, contingent liabilities and contingent assets. Section 21 does not apply to provisions, contingent liabilities and contingent assets covered by another section of FRS 102. Where those other Sections contain no specific requirements to deal with contracts that have become onerous, Section 21 applies to those contracts. Section 21 does not apply to financial instruments (including loan commitments) that are in scope of Section 11 *Basic Financial Instruments* or Section 12 *Other Financial Instruments Issues* (see Chapter 13), or insurance contracts (including reinsurance contracts) that an entity issues and reinsurance contracts that the entity holds, or financial instruments issued by an entity with a discretionary participation feature that are within the scope of FRS 103 *Insurance Contracts* (see Chapter 38). Section 21 also does not apply to executory contracts (i.e., contracts under which neither party has performed any obligations or both parties have partially performed their obligations to an equal extent), unless they are onerous contracts.

Section 21 requires a provision to be recognised when an entity has a present obligation (legal or constructive) as a result of a past event, it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation, and a reliable estimate can be made of the obligation. The amount required to be recognised as a provision is the best estimate of the expenditure required to settle the present obligation at the end of the reporting period.

Contingent liabilities and contingent assets are not recognised. Instead, Section 21 requires contingent liabilities to be disclosed, unless the possibility of any outflow is remote, and disclosure of contingent assets where an inflow of economic benefits is probable.

What you need to know

- A provision is recognised by an entity only when the entity has a present obligation (legal or constructive) as a result of a past event, it is probable that a transfer of economic benefits in settlement is required, and the amount of the obligation can be estimated reliably.
- The amount recognised as a provision is required to be the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. Where the effect of the time value of money is material, the amount of a provision is the present value of the expenditures expected to be required to settle the obligation.
- Section 21 prohibits the recognition of provisions for future operating losses.
- Contingent liabilities and contingent assets are not recognised. The only exception to this is for certain contingent liabilities assumed in a business combination, which are recognised by applying Section 19 *Business Combinations and Goodwill*.
- Section 21 requires contingent liabilities to be disclosed unless the possibility of any outflow in settlement is remote.
- Contingent assets are disclosed if an inflow of economic benefits is probable.
- Disclosures of provisions, contingent liabilities and contingent assets must be sufficient to enable users to understand their nature, timing and amount.

1 Introduction

Section 21 addresses the recognition, measurement and disclosure of provisions and the disclosure of contingent liabilities and contingent assets.

The principle of Section 21 for the recognition and measurement of provisions is consistent with that applied by IAS 37. A provision must be recognised by an entity if the entity has a present obligation (legal or constructive) as a result of a past event, it is probable that a transfer of economic benefits will be required, and the amount expected to settle the obligation can be measured reliably. [FRS 102.21.4].

The approach to contingent liabilities and contingent assets under Section 21 is also consistent with that taken by IAS 37. These items must not be recognised on balance sheet but disclosed. [FRS 102.21.12, FRS 102.21.13]. The only exception to this is for certain contingent liabilities assumed in a business combination, which must be recognised on the balance sheet of the acquirer. [FRS 102.19.14].

However, IAS 37 provides more guidance than Section 21 in certain areas. In addition, there are some differences between Section 21 and the equivalent guidance under IFRS. These are addressed at 2 below.

2 Comparison between Section 21 and IFRS

As stated at 1 above, Section 21 and IAS 37 apply the same principle to the recognition and measurement of provisions. The approach to the disclosure of provisions, contingent liabilities and contingent assets is also consistent between Section 21 and IAS 37. The key differences between Section 21 and IFRS are set out at 2.1 to 2.2 below.

2.1 Scope - financial guarantee contracts

Financial guarantee contracts are included in the scope of Section 21 when an entity has chosen to apply the requirements of Sections 11 and 12 for the recognition and measurement of financial instruments. Section 21 does not apply to financial guarantee contracts where:

- An entity has chosen to apply IAS 39 *Financial Instruments: Recognition and Measurement* and/or IFRS 9 *Financial Instruments* to its financial instruments.

Or

- An entity has elected under FRS 103 to continue the application of insurance contract accounting. [FRS 102.21.1A]. See 3.1.1.C below.

Under IFRS, issuers of financial guarantee contracts must apply IAS 32 *Financial Instruments: Presentation*, IFRS 9 and IFRS 7 *Financial Instruments: Disclosures*, to financial guarantee contracts even though they meet the definition of an insurance contract in IFRS 17 *Insurance Contracts*, if the risk transferred is significant. However, if an entity has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts, the issuer may elect to apply either IFRS 9 or IFRS 17. This election may be made contract by contract, but the election for each contract is irrevocable.

Under IFRS, for the holder, a financial guarantee contract held that is considered to be an integral component of the guaranteed debt instrument will be accounted for as part of the Expected Credit Loss on that debt instrument.

IFRS does not cover the accounting for the holder of a financial guarantee contract which is not considered to be integral to the underlying debt instruments. The holder of such financial guarantee contracts needs to develop an accounting policy in accordance with the hierarchy set out in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*. In doing so, entities could look to the requirements of IAS 37 dealing with contingent assets or reimbursement assets, at least as far as recoveries under the contract are concerned. In certain situations, it could also be appropriate for the holder of a financial guarantee contract to account for it as an asset at fair value through profit or loss. This might be the case if the guaranteed asset has itself been classified as fair value through profit or loss.

2.2 Disclosures

The disclosures required by Section 21 are discussed at 4 below.

Section 21 does not refer specifically to the following two disclosures required by IAS 37:

- The disclosure of major assumptions concerning future events that may affect the amount required to settle an obligation where this is necessary to provide adequate information. [IAS 37.85(b)].
- A separate line item in the reconciliation of opening and closing provision balances showing the increase during the period in the discounted amount arising from the passage of time and the effect of any change in discount rate. [IAS 37.84(e)]. Section 21 allows the line showing additions to provisions in the period to include adjustments that arise from changes in measuring the discounted amount. [FRS 102.21.14(a)(ii)].

In addition, Section 21 requires an entity to disclose the expected amount and timing of any payments resulting from an obligation. [FRS 102.21.14(b)]. IAS 37 requires disclosure only of the expected timing of payments resulting from an obligation. [IAS 37.85(a)].

Like IAS 37, Section 21 offers an exemption from certain disclosures that would otherwise be required in those extremely rare cases where disclosure of some or all of the information required can be expected to prejudice seriously the position of the entity in a dispute with other parties. [FRS 102.21.17]. Under the seriously prejudicial exemption in IAS 37, entities must disclose the general nature of the dispute, together with the fact that, and the reason, the information otherwise required by the standard has not been disclosed. [IAS 37.92]. Section 21 includes much more fulsome disclosure requirements in the case where information is considered seriously prejudicial. These requirements are set out at 4.4. below and significantly reduce the usefulness of the seriously prejudicial exemption under Section 21.

Section 21 requires an entity to disclose the nature and business purpose of any financial guarantee contracts it has issued, regardless of whether a provision is required or contingent liability disclosed. [FRS 102.21.17A]. In addition, to the extent a provision is recognised, or contingent liability disclosed, for financial guarantee contracts, the general provisions or contingent liabilities disclosures set out at 4.1 and 4.2 below are also required. Under IFRS, the disclosures required for financial guarantee contracts issued will depend on whether they are accounted for under IAS 32, IFRS 7 and IFRS 9, or IFRS 17 (see 2.1 above).

3 Requirements of Section 21 for provisions and contingencies

3.1 Scope

Extract from Section 21

- 21.1 This section applies to provisions (ie liabilities of uncertain timing or amount), contingent liabilities and contingent assets except those provisions covered by other sections of this FRS. Where those other sections contain no specific requirements to deal with contracts that have become onerous, this section applies to those contracts. [FRS 102.21.1].

Section 21 uses the term 'liability' in a way that differs in some respects from the definition of a liability in paragraph 38 of Section 2 *Concepts and Pervasive Principles* and Appendix I *Glossary*. For the purposes of Section 21, a liability is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits.

[FRS 102.21.4A].

Section 21 applies to all provisions, contingent liabilities and contingent assets other than those covered by other sections of FRS 102. Where those other sections contain no specific requirements to deal with contracts that have become onerous, Section 21 applies to those contracts. [FRS 102.21.1].

Financial guarantee contracts are included in the scope of Section 21 when an entity has chosen to apply the requirements of Sections 11 and 12 for the recognition and measurement of financial instruments. Section 21 does not apply to financial guarantee contracts where:

- The entity has chosen to apply IAS 39 and/or IFRS 9 to its financial instruments (see Chapters 11- 13).
Or
- The entity has elected under FRS 103 to continue the application of insurance contract accounting.
[FRS 102.21.1A]

Where an entity has chosen to apply IAS 39 and/or IFRS 9 to its financial instruments, the issuer of financial guarantee contracts will account for those contracts as financial instruments under those standards. However, financial guarantee contracts held are not within the scope of IAS 39, IFRS 9, or FRS 103 and therefore would fall in scope of Section 21 regardless of whether the elections set out in paragraph 1A of Section 21 are applied.

The requirements of Section 21 relating to financial guarantee contracts are discussed at 3.3.5 below.

The following table lists the specific types of transactions or circumstances that might give rise to a provision, contingent liability or contingent asset. In some cases, the transaction is identified in Section 21 only to prohibit recognition of any liability, such as for future operating losses (see 3.2.4.A below). This chapter does not address those items identified below as falling outside the scope of Section 21.

Types of transactions or circumstances referred to	In scope	Out of scope	Another section
Restructuring costs	•		
Product warranties	•		
Legal claims	•		
Reimbursement rights	•		
Future operating costs (e.g., training)	•		
Future operating losses	•		
Onerous contracts	•		
Financial guarantee contracts	•		
Provisions for depreciation, impairment or doubtful debts		•	Section 17/Section 27/Section 11/Section 12
Executory contracts (unless onerous)		•	

Types of transactions or circumstances referred to	In scope	Out of scope	Another section
Financial Instruments in the scope of Section 11		•	Section 11
Financial Instruments in the scope of Section 12		•	Section 12
Contingent liabilities acquired in a business combination		•	Section 19
Leases		•	Section 20
Employee benefits		•	Section 28
Income taxes		•	Section 29
Insurance contracts		•	FRS 103

3.1.1 Items outside the scope of Section 21

3.1.1.A Executory contracts, except where the contract is onerous

Section 21 does not apply to executory contracts unless they are onerous. Executory contracts are contracts under which neither party to the contract has performed any of their obligations or where both parties have performed their obligations to an equal extent. *[FRS 102.21.1B(c)]*. This means that contracts such as supplier purchase contracts and capital commitments, which would otherwise fall within the scope of Section 21, are exempt unless the contract becomes onerous. Onerous contracts are addressed at 3.3.1.A below.

3.1.1.B Financial instruments

Section 21 does not apply to financial instruments (including loan commitments) that are within the scope of Section 11 or Section 12. *[FRS 102.21.1B(a)]*.

As noted at 3.1 above, an entity must apply Section 21 to financial guarantee contracts unless it has chosen to apply IAS 39 or IFRS 9 to its financial instruments or FRS 103 to continue to account for these guarantees as insurance contracts. *[FRS 102.21.1A]*.

3.1.1.C Insurance contracts

Insurance contracts (including reinsurance contracts) that an entity issues and reinsurance contracts that the entity holds fall within the scope of FRS 103 and not FRS 102. *[FRS 102.21.1B(b)]*. An insurance contract is defined as "A contract under which one party (the insurer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder". *[FRS 102 Appendix I]*. A reinsurance contract is "An insurance contract issued by one insurer (the reinsurer) to compensate another insurer (the cedant) for losses on one or more contracts issued by the cedant". *[FRS 102 Appendix I]*.

Section 21 also excludes from its scope financial instruments issued by an entity with a discretionary participation feature that are within the scope of FRS 103. *[FRS 102.21.1B(b)]*. These features are most commonly found in life insurance policies and are essentially contractual rights of the holder to receive, as a supplement to guaranteed benefits, significant additional benefits whose amount or timing are contractually at the discretion of the issuer and based on the performance of the insurer, a fund or a specified pool of investments. *[FRS 102 Appendix I]*.

3.1.1.D Areas covered by other Sections of FRS 102

Section 21 does not apply to those provisions covered by other sections of FRS 102. *[FRS 102.21.1]*. However, other than financial instruments and insurance contracts which are explicitly excluded from its scope, Section 21 does not provide any more examples of what transactions or circumstances this exclusion is intended to cover. Examples of other transactions and circumstances which are covered elsewhere and that we would therefore expect to fall outside the scope of Section 21 are included in the table at 3.1 above. However, where those other sections of the FRS do not contain specific requirements on accounting for onerous contracts, Section 21 must be applied. *[FRS 102.21.1]*. This would include, for example:

- Leases that becomes onerous before the commencement date of the lease, and onerous short-term leases and leases for which the underlying asset is of low value, that are accounted for in accordance with paragraph 6 of Section 20 *Leases* (see Chapter 23 at 6.1.1 and Chapter 23 at 6.1.2).
- Revenue from contracts with customers in scope of Section 23 *Revenue from Contracts with Customers* (see Chapter 25) that are or have become onerous.

Unlike Section 21, IAS 37 is explicit that these types of onerous contract are in scope of IAS 37. [IAS 37.5]. See 3.3.1.A below.

Section 21 notes that the word 'provision' is sometimes used in the context of items such as depreciation, impairment of assets and doubtful debts. Such provisions are not covered by Section 21 because they are adjustments to the carrying amount of assets rather than recognition of liabilities. [FRS 102.21.3].

3.1.1.E Provisions compared to other liabilities

The feature distinguishing provisions from other liabilities, such as trade creditors and accruals, is the existence of uncertainty about the timing or amount of the future expenditure required in settlement. This distinction is not explicitly made in FRS 102 but is explained in IAS 37, which compares provisions to:

- Trade payables - liabilities to pay for goods or services that have been received or supplied and have been invoiced or formally agreed with the supplier.
- Accruals - liabilities to pay for goods or services that have been received or supplied but have not been paid, invoiced or formally agreed with the supplier, including amounts due to employees (for example, amounts relating to accrued vacation pay). Although it is sometimes necessary to estimate the amount or timing of accruals, the uncertainty is generally much less than for provisions. [IAS 37.11].

For trade creditors and their associated accruals, there is little uncertainty regarding either the amount of the obligation (which would be determined by the contracted price for the goods and services being provided) or the timing of settlement (which would normally occur within an agreed period following transfer of the goods and services in question and the issue of an invoice). In practice, however, contracts can be more complex and give rise to a wide range of possible outcomes in terms of the amount or timing of payment. In these circumstances, the difference between provisions and other liabilities is less obvious and judgement may be required to determine where the requirement to make an estimate of an obligation indicates a level of uncertainty about timing or amount that is more indicative of a provision. Such judgements, if significant to the amounts recognised in the financial statements, would merit disclosure (see Chapter 6 at 7.3). [FRS 102.8.6].

Some liabilities may initially be classified as provisions due to uncertainty regarding the timing or amount of payment. Subsequently, after negotiation with a counterparty or a decision by a court of law, the exact amount and timing of settlement may be agreed. As the entity now has an obligation to pay a fixed sum at an agreed point in time, the liability no longer meets the definition of a provision and instead is a financial liability in scope of Sections 11 and 12.

One reason why this distinction matters is that provisions are subject to narrative disclosure requirements regarding the nature of the obligation and the uncertainties over timing and amount and to quantitative disclosures of movements arising from their use, remeasurement or release that do not apply to other payables (see 4.1 below). In fact, although questions of recognition and measurement are important, transparency of disclosure is also a very significant matter in relation to accounting for provisions and ensuring that their effect is properly understood by users of the financial statements.

3.2 Determining when a provision must be recognised

Extract from Section 21

- 21.4 An entity shall recognise a provision only when:
- the entity has an obligation at the reporting date as a result of a past event;
 - it is probable (ie more likely than not) that the entity will be required to transfer economic benefits in settlement; and
 - the amount of the obligation can be estimated reliably. [FRS 102.21.4].

Where all of these three conditions are met, a provision must be recognised as a liability in the statement of financial position. In most cases, the recognition of a provision results in an immediate expense in profit or loss. However, in some cases, it may be appropriate to recognise the amount of the provision as part of the cost of an asset such as inventories or property plant and equipment. [FRS 102.21.5]. A common case when a provision is recognised as part of the cost of an asset is in relation to decommissioning costs (see 3.11.1 below).

3.2.1 The entity has an obligation at the reporting date as a result of a past event

An obligation at the reporting date can be either a legal obligation that can be enforced by law, or a constructive obligation. A constructive obligation arises when an entity has created valid expectations in other parties that it will discharge the obligation. [FRS 102.21.6]. This may be as a result of past practice, published policies or a sufficiently specific current statement. [FRS 102 Appendix I]. The entity must have no realistic alternative to settling the obligation, whether legal or constructive, in order to meet condition (a) of the recognition criteria for provisions set out at 3.2 above. [FRS 102.21.6].

The assessment of whether an entity has a constructive obligation may not always be straightforward.

How we see it

In our view, evidence of communication between the entity and other parties is required in order to be able to conclude that other parties have a valid expectation that the entity will honour its obligations and that a constructive obligation exists. In this context, an internal memo or board decision is not sufficient. It is not necessary for the entity to know the identity of the party to whom the obligation is owed.

Restructuring provisions are an example of a case where judgement is often needed to determine whether a valid expectation exists, as discussed at 3.3.2 below.

When assessing whether an entity has a legal obligation, an issue that can arise in practice is determining exactly when a change in law is recognised. Section 21 does not address this. However, IAS 37 states that an obligation arises only when the legislation is virtually certain to be enacted as drafted and suggests that in many cases, this will not be until it is enacted. [IAS 37.22]. Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, this guidance may be relevant for an FRS 102 reporter to consider in developing an accounting policy for proposed new laws yet to be finalised.

In addition to an entity having an obligation at the reporting date, the obligation must arise as a result of a past event. Obligations that will arise from an entity's future actions do not satisfy condition (a) of the recognition criteria set out at 3.2 above, regardless of how likely the future actions are to occur, and even if they are contractual. [FRS 102.21.6]. This is illustrated in the following scenarios. [FRS 102.21.6, FRS 102.21A.8].

Illustration 3-1 No provision without a past obligating event

Scenario 1: Requirement to fit smoke filters

An entity may intend or need to carry out expenditure to fit smoke filters in a particular type of factory in the future, as a result of either legal requirements or commercial pressures.

In this scenario, the entity can avoid the expenditure required to fit smoke filters by its future actions, for example by changing its method of operation or selling the factory. It therefore has no obligation at the reporting date arising as a result of a past event and no provision is recognised.

Scenario 2: Staff retraining as a result of changes to the income tax system

The government introduces changes to the income tax system. As a result of those changes, an entity in the financial services sector will need to retrain a large proportion of its administrative and sales workforce in order to ensure continued compliance with tax regulations. At the end of the reporting period, no retraining of staff has taken place.

In this scenario, the change in tax law does not impose an obligation on the entity to do any retraining. An obligating event for recognising a provision (the retraining itself) has not taken place at the reporting date to create a present obligation.

Sometimes it is not always clear whether a present obligation exists as a result of a past event, in which case judgement is required. A common example is a lawsuit, in which the responsibility of the defendant has not yet been established. IAS 37, which shares consistent principles with Section 21 regarding the recognition of provisions, suggests that entities would recognise an obligation if, taking account of all available evidence, it is 'more likely than not' that a present obligation exists at the end of the reporting period. [IAS 37.15]. In this context, 'all available evidence' would include the opinion of experts together with any additional evidence provided by events after the reporting period. [IAS 37.16]. Indeed, Section 32 *Events after the End of the Reporting Period* cites the settlement of a court case as such an example of facts that might indicate the existence of an obligation at the reporting date. [FRS 102.32.5(a)].

3.2.2 A transfer of economic benefits is probable

A transfer of economic benefits is considered probable if it is more likely than not to occur. [FRS 102.21.4]. In practice this is taken as meaning a probability of greater than 50%.

Where an entity has a number of similar obligations, the probability that a transfer of economic benefits will occur is based on the class of obligations as a whole. Whilst this is not explicitly stated in Section 21, it is implied in an example in the Appendix to the Section, where a manufacturer recognises a provision for warranties given at the time of sale to purchasers of its product. The obligating event is the sale of a product with a warranty and an outflow of resources in settlement is determined to be probable for the warranties as a whole (i.e., it is more likely than not that the entity will have to honour some warranties claims). [FRS 102.21A.4]. Warranty provisions are discussed further at 3.3.3 below.

3.2.3 The amount of the obligation can be measured reliably

Section 21 provides no guidance on how this condition is to be applied. However, reliability is defined in FRS 102, Appendix I as “The quality of information that makes it free from material error and bias and represents faithfully that which it either purports to represent or could reasonably be expected to represent.” [FRS 102 Appendix I]. Free from error means there are no errors or omissions in the description of the events, and the process used to produce the reported information has been selected and applied with no errors. In this context, free from error does not mean perfectly accurate in all respects. [FRS 102.2.18]. Combined with the requirement that a provision is measured at the best estimate of the amount required to settle the obligation at the reporting date, [FRS 102.21.7], it could be argued that only in rare cases would a lack of a reliable measure prohibit recognition of an obligation. Under the hierarchy set out in Section 10 *Accounting Policies, Estimates and Errors* entities may consider the requirements of IAS 37, which takes the view that a sufficiently reliable estimate can almost always be made for a provision where an entity can determine a range of possible outcomes. Hence IAS 37 contends that it will only be in extremely rare cases that a range of outcomes cannot be determined. [IAS 37.25]. Whether such a situation is as rare as IAS 37 asserts may be open to question, especially for entities trying to determine estimates relating to potential obligations that arise from litigation and other legal claims. However, given the consistent principles applied by Section 21 and IAS 37 to the recognition of provisions, we would expect entities applying FRS 102 to apply a similar approach in assessing whether a reliable estimate can be made of the amount of an obligation.

In the event that a present obligation cannot be measured reliably, it is regarded as a contingent liability, [FRS 102 Appendix I] (see 3.4 below).

3.2.4 Cases where recognition of a provision is prohibited

Section 21 sets out two cases in which the recognition of a provision is prohibited. They are future operating losses and staff training costs. The common theme in these cases is that the potential obligation does not exist independently of an entity's future actions. Obligations that will arise from the entity's future actions (i.e., the future conduct of its business) do not satisfy the condition in paragraph 21.4(a) of Section 21, no matter how likely they are to occur. [FRS 102.21.6]. This principle is also relevant to determining the timing of recognition of a provision, whereby no liability is recognised until the obligation cannot otherwise be avoided by the entity.

3.2.4.A Future operating losses

Section 21 prohibits the recognition of provisions for future operating losses. [FRS 102.21.11B]. This is illustrated by Example 1 in the Appendix to Section 21, which is reproduced below. [FRS 102.21A.1].

Illustration 3-2: Future operating losses

An entity determines that it is probable that a segment of its operations will incur future operating losses for several years.

In this situation, no provision is recognised. There is no past event that obliges the entity to pay out resources and expected future losses do not meet the definition of a liability. However, the expectation of future losses may be an indicator that one or more assets are impaired.

As alluded to in Illustration 3-2 it would be wrong to assume that the prohibition of provisions for future operating losses in Section 21 has effectively prevented the effect of future operating losses from being anticipated. They may sometimes be recognised as a result of requirements in another Section of FRS 102. For example:

- Under Section 27 *Impairment of Assets* the carrying amount of an asset is compared with its recoverable amount when there is an indicator of impairment. If the recoverable amount is lower than the carrying amount then the asset must be impaired to its recoverable amount. The calculation of the recoverable amount includes the effect of any future operating losses (or sub-standard operating profits) on the value of the asset. See Chapter 29.
- Under Section 27, inventories are written down to selling price less costs to complete and sell to the extent that they will not be recovered from future revenues, rather than leaving the difference between carrying amount and selling prices less costs to complete and sell to show up as a future operating loss. See Chapter 16 at 3.3.

This is therefore a rather more complex issue than Section 21 acknowledges. Indeed, Section 21 itself has to navigate closely the dividing line between the general prohibition of the recognition of future losses and the recognition of contractual or constructive obligations that are expected to give rise to losses in future periods.

3.2.4.B Staff training costs

Illustration 3-2, scenario 2, at 3.2.1 above reproduces an example from Section 21 where the government introduces changes to the income tax system. An entity needs to retrain a large proportion of its administrative and sales workforce in order to ensure continued compliance with tax regulations. Section 21 argues that there is no present obligation until the actual training has taken place and so no provision is recognised. In many cases the need to incur training costs could also be avoided by the entity by its future actions. For example, the cost could be avoided by hiring new staff who were already appropriately trained.

3.3. Examples of provisions in the scope of Section 21

3.3.1 Onerous contracts

Although future operating losses in general cannot be provided for, Section 21 requires that “If an entity has an onerous contract, the present obligation under the contract shall be recognised and measured as a provision”. [FRS 102.21.11A].

FRS 102 defines an onerous contract as a “...contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it.”

[FRS 102 Appendix I]. This requires that the contract is onerous to the point of being directly loss-making, not simply uneconomic by reference to current prices. For example, a change to more environmentally friendly materials or processes because of increased stakeholder interest in climate change could mean that contracts previously expected to be profitable are now expected to be loss making.

The unavoidable costs under a contract reflect the least net cost of exiting from the contract. This is the lower of the cost of fulfilling it and any compensation or penalties arising from failure to fulfil it.

The cost of fulfilling the contract comprises:

- The incremental costs of fulfilling that contract
And
- An allocation of other costs that relate directly to fulfilling contracts [FRS 102.21A.2]

The requirement that the cost of fulfilling a contract comprises the incremental costs of fulfilling that contract, and an allocation of costs that relate directly to fulfilling contracts is consistent with IAS 37. IAS 37 also states that examples of the cost of fulfilling the contract may include direct labour and materials. Examples of other costs that relate directly to fulfilling the contract may include an allocation of the depreciation charge for an item of property, plant and equipment used in fulfilling that contract among others. [IAS 37.68A]. In addition, the Basis for Conclusions to IAS 37 notes that several IFRS accounting standards, such as IAS 2 *Inventories*, specify the costs to include in measuring a non-monetary asset. Although the detailed requirements differ, they all require an entity to include both the incremental costs of purchasing or constructing the asset, and an allocation of other directly related or directly attributable costs, such as production overheads. The Board concluded that, in assessing whether a contract to deliver goods is onerous, the way in which an entity determines the cost of fulfilling the contract should be broadly consistent with the way it measures the costs of the goods when it holds them. [IAS 37.BC7]. Given the similarities between the requirements of paragraph A.2 of Section 21 and paragraph 68A of IAS 37 we expect this additional guidance from IAS 37 and its Basis for Conclusions to be equally informative for

entities applying FRS 102. Therefore, entities could look to other Sections of FRS 102, such as Section 13 *Inventories*, Section 17 *Property, Plant and Equipment* and Section 18 *Intangible Assets other than Goodwill* when considering which costs are included or excluded when assessing whether an onerous contract provision is recognised.

As noted above, Section 21 defines an onerous contract a contract “...in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it.” [FRS 102 Appendix I]. Neither Section 21 nor IAS 37 provide any further guidance on how ‘economic benefits expected to be received’ should be determined and there is some diversity in practice. In particular, whether the ‘economic benefit expected to be received’ should be interpreted narrowly (to include only the economic benefits to which the entity becomes directly entitled under the contract) or more broadly (to include other expected indirect benefits, such as access to future profitable contracts).

The evaluation of whether a contract is onerous does not require an intention by the entity to fulfil or to exit the contract. It does not even require there to be specific terms in the contract that apply in the event of its termination or breach. Its purpose is to recognise only the unavoidable costs to the entity. In the absence of specific clauses in the contract relating to termination or breach the unavoidable cost could include an estimation of the cost of walking away from the contract and having the other party go to court for compensation for the resultant breach.

There is a subtle yet important distinction between making a provision in respect of the unavoidable costs under a contract (reflecting the least net cost of what the entity has to do) compared to making an estimate of the cost of what the entity ‘intends’ to do. The first is an obligation, which merits the recognition as a provision. The second is a choice of the entity, which fails the recognition criteria because it does not exist independently of the entity’s future actions, [FRS 102.21.6], and is therefore akin to a future operating loss.

Illustration 3-3: Onerous supply contract

Entity P negotiated a contract in 20X3 for the supply of components when availability in the market was scarce. It agreed to purchase 100,000 units per annum for 5 years commencing 1 January 20X4 at a price of £20 per unit. Since then, new suppliers have entered the market and the typical price of a component is now £5 per unit. Whilst its activities are still profitable (Entity P makes a margin of £6 per unit of finished product sold) changes to the entity’s own business means that it will not use all of the components it is contracted to purchase. As at 31 December 20X6, Entity P expects to use 150,000 units in future and has 55,000 units in inventory. The contract requires 200,000 units to be purchased before the agreement expires in 20X8. If the entity terminates the contract before 20X8, compensation of £1 million per year is payable to the supplier. Each finished product contains one unit of the component.

Therefore, the entity expects to achieve a margin of £900,000 ($150,000 \times £6$) on the units it will produce and sell; but will make a loss of £15 ($£20 - £5$) per unit on each of the 105,000 components ($55,000 + 200,000 - 150,000$) it expects to be left with at the end of 20X8 and now expects to sell in the components market.

In considering the extent to which the contract is onerous, Entity P in the example above must compare the net cost of the excess units purchased of £1,575,000 ($105,000 \times £15$) with the related benefits, which includes the profits earned as a result of having a secure source of supply. Therefore, the supply contract is onerous (directly loss making) only to the extent of the costs not covered by related revenues, justifying a provision of £675,000 ($£1,575,000 - £900,000$).

3.3.1.A Onerous leases

As discussed in 3.1.1.D above, where other sections of FRS 102 do not contain specific requirements on accounting for contracts that have become onerous, Section 21 must be applied. [FRS 102.21.1].

Section 20 does not specify any particular requirements for onerous leases. For leases that have already commenced, an entity will reflect an onerous lease contract by applying the requirements of Section 20, which require a lessee to apply Section 27 to determine whether a right-of-use asset is impaired and to account for any impairment loss identified. [FRS 102.20.59]. For leases that have not yet commenced, short-term leases and leases of low-value assets to which paragraph 6 of Section 20 is applied, no right-of-use asset is recognised. As Section 20 does not specify any particular requirements for these types of onerous leases, Section 21 applies to:

- Leases that become onerous before the commencement date of the lease
- Short-term leases (as defined in Appendix I to FRS 102) that are accounted for in accordance with paragraph 6 of Section 20 and that have become onerous
- And
- Leases for which the underlying asset is of low value that are accounted for in accordance with paragraph 6 of Section 20 and that have become onerous.

Unlike Section 21, IAS 37 is explicit that these types of onerous leases are in scope of IAS 37. [IAS 37.5].

If a lease contract includes non-lease components that have been accounted for separately from the lease components as per paragraph 28 of Section 20, these non-lease components fall under the scope of Section 21. This is because Section 20 mandates that, unless the practical expedient in paragraph 33 is used, a lessee must account for non-lease components under other sections of FRS 102. [FRS 102.20.34].

In practice, a lease contract may sometimes require the lessee to pay costs related to the leased property to third parties during the lease term. For instance, the lessee, as the legal occupier of the property, may be required by law to pay quarterly business rates or other levies to local authorities or the government. Such levies are statutory obligations, and under IFRS, fall in scope of IFRIC 21. [IFRIC 21.4]. As discussed at 3.11.5 below, IFRIC 21 notes that the obligating event that gives rise to a liability to pay a levy is the activity that triggers the payment of the levy, as identified by the legislation. [IFRIC 21.8]. Applying the requirements of IFRIC 21, the lessee recognises the levy when the event that triggers the payment of the levy occurs, which would be on a quarterly basis over the period in which the lessee remains legal occupier in this case. In the event that the lessee vacates the property before the lease term ends, it would not be appropriate for the lessee to recognise an onerous contract provision for these payments over the remaining lease term. While signing the lease contract is necessary, it is not sufficient to create a present obligation for business rates for the entire lease term. Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, it would be appropriate for entities to consider the guidance in IFRIC 21 in developing an accounting policy for the recognition of liabilities for levies under FRS 102 in accordance with the hierarchy in Section 10 (see Chapter 9 at 3.1).

A lease agreement may also obligate the lessee to bear additional costs payable to third parties, which are not statutory requirements. For instance, a lease might mandate that the lessee ensures the leased property is properly insured throughout the lease term. If the lessee vacates the property before the lease ends but is bound by the lease contract to maintain insurance coverage until the lease expires, this constitutes a 'past obligating event'. Consequently, the lessee must recognise an onerous contract provision for the insurance costs. [FRS 102.21.4]. Conversely, if the lease does not impose such an obligation and the lessee voluntarily continues to insure the property for the duration of the lease, there is no past obligating event concerning insurance costs. In this scenario, the insurance expenses would be considered future operating costs and expensed as incurred, without recognising an onerous contract provision.

3.3.1.B Contracts with customers that are, or have become, onerous

As Section 23 contains no specific requirements to address contracts with customers that are, or have become, onerous, Section 21 applies to such contracts. [FRS 102.21.1].

In assessing whether a contract with a customer is onerous, an entity is required to compare the unavoidable costs of meeting the obligations under the contract to the economic benefits expected to be received under it. The unavoidable costs under the contract are the lower of the cost of fulfilling the contract and any compensation or penalties arising from failure to fulfil the contract. [FRS 102.21A.2].

One question that may arise, is how an entity must account for an onerous contract with a customer when the contract includes several 'over time' performance obligations that are satisfied consecutively. Since the requirements for onerous contracts are outside the scope of Section 23, an entity's accounting for onerous contracts does not affect the accounting for its revenue from contracts with customers in accordance with Section 23.

How we see it

To account for an onerous contract with a customer when the contract includes several 'over time' performance obligations that are satisfied consecutively, we believe that an entity must use an 'overlay' approach, which consists of two steps:

- Apply the requirements of Section 23 to measure progress in satisfying each performance obligation, and account for the related costs when incurred in accordance with the applicable standards.
- At the end of each reporting period, apply Section 21 to determine if the remaining contract as a whole is onerous. If the entity concludes that the remaining contract as a whole is onerous, it recognises a provision only to the extent that the amount of the remaining unavoidable costs under the contract exceed the remaining economic benefits to be received under it.

This approach is shown in Illustration 3-4 below.

Illustration 3-4: Onerous contract with several 'over time' performance obligations that are satisfied consecutively

Entity A enters into a contract that consists of two distinct performance obligations, which are satisfied consecutively. Revenue is recognised over time for both performance obligations. Entity A expects to satisfy the first performance obligation (PO1) during Years 1-4 and the second performance obligation (PO2) in Years 5-6. Entity A measures progress towards the satisfaction of both performance obligations based on costs incurred compared to the total expected costs (i.e., it applies an input method under Section 23).

If Entity A terminates the contract, a penalty of £100,000 is payable.

The expected revenues and costs at the inception of the contract and the updated expectations at the beginning of Year 2 are as follows:

	At contract inception		Update in Year 2		
	<i>Expected costs (£)</i>	<i>Expected revenue (£)</i>	<i>Expected costs (£)</i>	<i>Expected revenue (£)</i>	<i>Expected progress (£)</i>
PO1					
Year 1	24,000	30,000	24,000	30,000	25%
Year 2	24,000	30,000	24,000	30,000	25%
Year 3	24,000	30,000	24,000	30,000	25%
Year 4	24,000	30,000	24,000	30,000	25%
Total PO1	96,000	120,000	96,000	120,000	
PO2					
Year 5	10,000	15,000	32,000	15,000	50%
Year 6	10,000	15,000	32,000	15,000	50%
Total PO2	20,000	30,000	64,000	30,000	
Total contract	116,000	150,000	160,000	150,000	
Gross profit/(loss)		34,000		(10,000)	

At contract inception, Entity A expects a positive margin for both performance obligations. At the beginning of Year 2, its estimates of the cost to fulfil the second performance obligation are increased by £44,000. Therefore, Entity A now expects to incur a loss of £34,000 for the second performance obligation, resulting in a negative margin for the entire contract of £10,000.

The contract as a whole is only onerous to the extent that the remaining costs to be incurred exceed the remaining benefits to be recognised. This is not the £34,000 loss relating to the second performance obligation, because at the beginning of Year 2, Entity A has yet to recognise profits of £18,000 for the completion of the first performance obligation. As a result, the net cost of fulfilling the contract at Year 2 is £16,000. This cost is less than the termination penalty of £100,000 and therefore, applying the 'overlay' approach explained above, Entity A recognises a provision under Section 21 of £16,000 in Year 2.

In Years 2 to 4, as the first performance obligation is being completed, the provision increases to reflect the higher net cost of satisfying the remaining performance obligations in the contract. As at the end of Year 4, only the revenues and costs relating to the second performance obligation remain, such that the provision now stands at £34,000 and is utilised in Years 5 and 6 as the related losses are incurred.

The table below illustrates the effect of this accounting treatment (assuming that the actual outcome of the contract is the same as the updated estimates). This example ignores the time value of money for simplicity reasons.

	<i>Costs</i>	<i>Revenue</i>	Provision		<i>Profit or loss for the period</i>
			<i>Additions/ Utilisations</i>	<i>Balance</i>	
Year 1	24,000	30,000	-	-	6,000
Year 2 (change in estimated total costs)	-	-	16,000	16,000	(16,000)
Year 2	24,000	30,000	6,000	22,000	-
Year 3	24,000	30,000	6,000	28,000	-
Year 4	24,000	30,000	6,000	34,000	-
Year 5	32,000	15,000	(17,000)	17,000	-
Year 6	32,000	15,000	(17,000)	-	-
Total	160,000	150,000	-	-	(10,000)

The effect of an onerous contract provision, or a change in the provision, is recognised as an expense in profit or loss and not as an adjustment to revenue.

As provisions for onerous contracts with customers are in the scope of Section 21, they are classified as provisions in the balance sheet and disclosed in accordance with Section 21 (see 4.1 below). Onerous contract provisions are outside the scope of Section 23 and are not included within contract liabilities.

Since the definition of an onerous contract in Section 21 refers only to a contract, the unit of account to determine whether an onerous contract exists is the contract itself, rather than the performance obligations identified in accordance with Section 23. [FRS 102.21A.2]. As a result, the entity must consider the entire remaining contract, including remaining revenue to be recognised for unsatisfied, or partially unsatisfied, performance obligations and the remaining costs to fulfil those performance obligations.

As discussed at 3.3.1 above, there is diversity in practice in how entities determine the economic benefits expected to be received under a contract for the purposes of assessing whether a contract is onerous. Where a contract with a customer contains an element of variable consideration, it is likely that judgement will be required in assessing the economic benefits expected to be received under a contract. This may particularly be the case where an entity is required to constrain the estimate of variable consideration to be included in the transaction price for revenue recognition purposes under Section 23. Variable consideration under Section 23 is discussed further in Chapter 25 at 6.2.

3.3.2 Restructuring provisions

A restructuring is a programme that is planned and controlled by management and materially changes either:

- The scope of a business undertaken by an entity.
Or
- The manner in which that business is conducted. [FRS 102 Appendix I].
- In practice, a restructuring may include changes such as the sale or termination of a line of business, the closure of business locations in a country or region, changes in management structure or fundamental reorganisations that have a material effect on the nature and focus of the entity's operations. Whilst the definition of a restructuring may be widely interpreted, there must be a material change to either the scope of the business or the way in which it is conducted. This may be a subjective judgement. However, this distinction is essential to prevent entities from presenting routine operating expenses as restructuring costs, which could mislead users of the financial statements by portraying such costs as something other than the normal expenditures of running a dynamic business.

An entity recognises a provision for restructuring costs only when it has a legal or constructive obligation at the reporting date to carry out the restructuring. [FRS 102.21.11D].

The specific requirements within Section 21 for the recognition of a restructuring provision seek to define the circumstances that give rise to a constructive obligation to restructure.

Extract from Section 21

21.11C A restructuring gives rise to a constructive obligation only when an entity:

- (a) has a detailed formal plan for the restructuring identifying at least:
 - (i) the business or part of a business concerned;
 - (ii) the principal locations affected;
 - (iii) the location, function, and approximate number of employees who will be compensated for terminating their services;
 - (iv) the expenditures that will be undertaken; and
 - (v) when the plan will be implemented; and
- (b) has raised a valid expectation in those affected that it will carry out the restructuring by starting to implement that plan or announcing its main features to those affected by it.

[FRS 102.21.11C]

The following examples based on the Appendix to Section 21 illustrate how a constructive obligation for a restructuring may or may not be created. [FRS 102.21A.6, FRS 102.21A.7].

Illustration 3-5: The effect of timing of the creation of a constructive obligation on the recognition of a restructuring provision

Scenario 1: Closure of a division - no implementation before the end of the reporting period

On 12 December 20X6 the board of an entity decided to close down a division. Before the end of the reporting period (31 December 20X6) the decision was not communicated to any of those affected and no other steps had been taken to implement the decision.

In these circumstances, no provision is recognised at 31 December 20X6 because the actions of management prior to this date are insufficient to create a constructive obligation.

Scenario 2: Closure of a division - Communication and implementation before the end of the reporting period

On 12 December 20X6, the board of an entity decided to close a division making a particular product. On 20 December 20X6 a detailed plan for closing the division was agreed by the board, letters were sent to customers warning them to seek an alternative source of supply, and redundancy notices were sent to the staff of the division.

The communication of management's decision to customers and employees on 20 December 20X6 creates a valid expectation that the division will be closed, thereby giving rise to a constructive obligation from that date. Accordingly, a provision is recognised at 31 December 20X6 for the best estimate of the costs that would be incurred to close the division.

In practice it can be very difficult to determine whether it is appropriate to recognise a provision for the future costs of a restructuring programme. The determination of whether an organisational change is a material change or just part of a process of continuous improvement is a subjective judgement. Once it has been established that the activities in question constitute a restructuring rather than an ongoing operating cost, it can be difficult to determine whether management's actions before the reporting date have been sufficient to have 'raised a valid expectation in those affected'. [FRS 102.21.11C(b)]. Even if a trigger point is easily identifiable, such as the date of an appropriately detailed public announcement, it might not necessarily commit management to the whole restructuring, but only to specific items of expenditure such as redundancy costs. When the announcement is less clear, referring for example to consultations, negotiations or voluntary arrangements, particularly with employees, judgement is required. Furthermore, taken on its own, the 'valid expectation' test is at least as open to manipulation as one based on the timing of a board decision. Entities anxious to accelerate or postpone recognition of a liability could do so by advancing or deferring an event that signals such a commitment, such as a public announcement, without any change to the substance of their position.

In these situations, it is important to consider all the related facts and circumstances and not to focus on a single recognition criterion. The objective of the analysis is to determine whether there is a past obligating event at the reporting date. The guidance in Section 21 about restructuring, referring as it does to constructive obligations and valid expectations is ultimately aimed at properly applying the principle in Section 21 that only those obligations arising from past events and existing independently of an entity's future actions are recognised as provisions. [FRS 102.21.6]. In essence, a restructuring provision qualifies for recognition if, as at the reporting date, it relates to a detailed plan of action from which management cannot realistically withdraw.

3.3.2.A Costs that can (and cannot) be included in a restructuring provision

Section 21 does not address which costs can or cannot be included within a restructuring provision. IAS 37, which contains consistent principles to Section 21 on the recognition and measurement of provisions, imposes criteria to restrict the types of cost that can be provided for. They specify that a restructuring provision must include only the direct expenditures arising from the restructuring, which are those that are both:

- Necessarily entailed by the restructuring.
- And
- Not associated with the ongoing activities of the entity. [IAS 37.80].

IAS 37 gives specific examples of costs that may not be included within the provision, because they relate to the future conduct of the business. Such costs include:

- Retraining or relocating continuing staff.
- Marketing.
- Investing in new systems and distribution networks. [IAS 37.81].

Given the consistent principles of Section 21 with IAS 37 in respect of the recognition of provisions, including restructuring provisions, we expect this additional guidance from IAS 37 to also be relevant for FRS 102 reporters. The application of these criteria would ensure that entities do not contravene the general prohibition in Section 21 against provisions for future operating losses. [FRS 102.21.11B].

Illustration 3-6: Distinguishing restructuring costs from ongoing expenses

On 15 November 20X6, management announced its intention to close down its operation in the North of the country and relocate to a new site in the South, primarily to be closer to its key customers. Before the end of the reporting period (31 December 20X6), the principal elements of the plan were agreed with employee representatives, a lease signed for a building at the new location, and a decision was made to market the existing facility for sale; all on the basis that production would start at the new location on 31 March 20X7 and the existing site would be vacated on 30 April 20X7. Production would cease at the existing site on 28 February 20X7 to allow plant and equipment to be relocated. Inventory levels would be increased up to that date so that customers could be supplied with goods sent from the Northern facility until 31 March 20X7.

Whilst the majority of the 600 existing staff was expected to take redundancy on 28 February 20X7, 50 had agreed to accept the entity's offer of relocation, including an incentive of £3,000 each towards relocation costs. Of those employees taking redundancy, 20 had agreed to continue to work for the entity until 30 June 20X7, to dismantle plant and equipment at the Northern site; install it at the new facility in the South; and train new staff on its operation. A bonus of £4,500 per employee would be payable if they remained until 30 June. A further 60 had agreed to stay with the entity until 31 March 20X7, to ensure that inventory was sent out to customers before the new site was operational, of which 10 would remain until 30 April 20X7 to complete the decommissioning of the Northern facility. These employees would also receive a bonus for staying until the promised date.

The announcement of management's decision on 15 November 20X6 and the fact that the key elements of the plan were understood by employees and customers of the Northern site before the end of the reporting period give rise to a constructive obligation that requires a provision to be recognised at 31 December 20X6 for the best estimate of the costs of the reorganisation.

However, only those direct costs of the restructuring not associated with ongoing activities can be included in the provision. For example, as follows:

Type of expense	Direct cost of restructuring	Associated with ongoing activities
Redundancy payments to 550 staff	•	
Payroll costs to 28 February 20X7 (all 600 staff)		•
Relocation incentive of £3,000 per employee (50 staff)		•
Payroll costs - to 31 March 20X7 (60 staff dispatching goods)		•
Payroll costs - March to June 20X7 (20 staff relocating plant) ^{Note 1}	•	•
Payroll costs - April 20X7 (10 staff decommissioning site)	•	
Costs of dismantling plant and equipment ^{Note 1}	•	•
Cost of transporting PP&E and inventory to the new site		•
Costs of recruiting and training staff for the Southern site		•
Rent of new site to 31 March 20X7 (pre-production)		•
Cost of invoices, forms and stationery showing new address		•
Note 1: Costs relating to dismantling plant and equipment that is no longer intended for use in the business could be regarded as a direct cost restructuring. However, costs relating to the dismantling and installation of equipment at the new site and training staff to operate it are costs associated with ongoing operations and, therefore, ineligible for inclusion in the restructuring provision.		

This example shows that individual classes of expenditure must be disaggregated into components that distinguish those elements associated with ongoing activities. Even if expenditure would not have been incurred without the restructuring activity, its association with ongoing activities means that it should not be included in a provision. In order to not contravene the general prohibition in Section 21 against provisions for future operating losses, the amounts to be included in a restructuring provision must be restricted to the direct expenditures arising from the restructuring, i.e., those that are both necessarily entailed by the restructuring; and not associated with the ongoing activities of the reporting entity.

[FRS 102.21.11B].

For that reason, whilst the cost of making employees redundant is an eligible restructuring cost, any incremental amounts paid to retain staff to ensure a smooth transition of operations from one location to another are not eligible because they are incurred to facilitate ongoing activities. Section 28 *Employee Benefits* requires these to be treated as short-term employee benefits to the extent that they are expected to be settled within 12 months after the end of the reporting period. [FRS 102.28.4]. Similarly, whilst the costs of dismantling plant and equipment intended to be scrapped is an eligible restructuring cost, the costs of dismantling plant and equipment intended to be relocated and installed at the new site is ineligible, because it is associated with ongoing activities.

The provision must not include identifiable future operating losses up to the date of the restructuring, unless they relate to an onerous contract. This means that even if the operation being reorganised is loss-making, its ongoing costs are not provided for. This is consistent with the general prohibition against the recognition of provisions for future operating losses. [FRS 102.21.11B].

The general requirement in Section 21 that gains from the expected disposal of assets cannot be taken into account in the measurement of provisions is also relevant to the measurement of restructuring provisions, even if the sale of the asset is envisaged as part of the restructuring. [FRS 102.21.8]. Whilst the expected disposal proceeds from asset sales might have been a significant element of the economic case for a restructuring, the income from disposal is not anticipated just because it is part of a restructuring plan.

3.3.3 Warranty provisions

Warranty provisions are specifically addressed by Example 4 in the Appendix to Section 21, which is reproduced in Illustration 3-8 and Illustration 3-9 at 3.8.1 and 3.8.2 below.

In Illustration 3-8 and Illustration 3-9 the assessment of the probability of an outflow of economic resources is made across the population of warranties as a whole and not using each potential claim as the unit of account. This makes it more likely that a provision will be recognised, because the probability criterion is considered in terms of whether at least one item in the population will give rise to a payment. Recognition then becomes a matter of reliable estimation and entities calculate an expected value of the estimated warranty costs.

An entity would apply Section 23 to warranties that provide the customer with a service in addition to the assurance that the product complies with agreed-upon specifications. If the entity provides the customer with the option to purchase the warranty separately, the warranty provides the customer with an additional service. If the warranty cannot be purchased separately, the entity assesses whether the warranty provides the customer with an additional service, considering whether the warranty is required by law, the length of the warranty coverage, and the nature of tasks that the entity promises to perform. [FRS 102.23.27]. If the warranty provides the customer with an additional service, that additional service is a separate performance obligation and is accounted for in accordance with Section 23. Only if the warranty, or part of the warranty, does not provide the customer with an additional service would the warranty be accounted for in accordance with Section 21. Warranties are discussed further in Chapter 25 at 10.1.

3.3.4 Litigation and other legal costs

The Appendix to Section 21 includes an example of a court case to illustrate how the principles of Section 21 distinguish between a contingent liability and a provision in such situations. This example is reproduced in Illustration 3-7 at 3.4 below. However, the assessment of the particular case in the example is clear-cut. In most situations, assessing the need to provide for legal claims is one of the most difficult tasks in the field of provisioning. This is due mainly to the inherent uncertainty in the judicial process itself, which may be very long and drawn out. Furthermore, this is an area where either provision or disclosure might risk prejudicing the outcome of the case, because they give an insight into the entity's own view on the strength of its defence that can assist the claimant.

Whether an entity makes provision for the costs of settling a case or to meet any award given by a court will depend on a reasoned assessment of the particular circumstances, based on appropriate legal advice. The evidence to be considered must also include any additional evidence occurring after the end of the reporting period that confirms whether the entity had a present obligation at the reporting date. This is relevant if, for example, the court case is settled in the period between the reporting date and the date on which the financial statements are authorised for issue. [FRS 102.32.5(a)].

3.3.5 Financial guarantee contracts

A financial guarantee contract is a "...contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payments when due in accordance with the original or modified terms of a debt instrument." [FRS 102 Appendix I].

As discussed at 3.1 above, in some cases, financial guarantee contracts may be excluded from the scope of Section 21. For financial guarantee contracts in the scope of Section 21, a provision is recognised if the general recognition criteria for provisions are met. This would include it being probable that the issuer would be required to make a payment under the guarantee.

3.4 Contingent liabilities

Extract from FRS 102 Appendix I

A contingent liability is either:

- (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or
- (b) a present obligation that arises from past events but is not recognised because:
 - (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or
 - (ii) the amount of the obligation cannot be measured with sufficient reliability.

The term 'possible' is not defined in FRS 102. Literally, it could mean any probability greater than 0% and less than 100%. However, since 'probable' is defined as 'more likely than not', [FRS 102 Appendix I], it would be reasonable to use the term 'possible' in the context of contingent liabilities as meaning a probability of 50% or less. Accordingly, the above definition restricts contingent liabilities to those where either the existence of an obligation or an outflow of economic resources is less than 50% probable, or in those rare cases when a probable obligation cannot be measured with sufficient reliability.

Section 21 requires that contingent liabilities must not be recognised as liabilities on the balance sheet. The only exception to this is certain contingent liabilities assumed in a business combination. [FRS 102.21.12]. Such contingent liabilities are covered by the requirements of Section 19 (see Chapter 22).

Information about contingent liabilities must be disclosed unless the probability of an outflow of resources is remote (see 4.2 below). [FRS 102.21.12]. When an entity is jointly and severally liable for an obligation (see 3.8.6 below), the part of the obligation that is expected to be met by other parties is treated as a contingent liability and disclosed. [FRS 102.21.12].

Although it is not explicitly required by Section 21, we would expect contingent liabilities to be assessed continually to determine whether an outflow of resources embodying economic benefits has become probable. Where this becomes the case, then the provision must be recognised in the period in which the change in probability occurs, except in the circumstances where no reliable estimate can be made. This is illustrated by Example 9 to Section 21, which is reproduced below. [FRS 102.21A.9].

Illustration 3-7: When the likelihood of an outflow of economic benefits becomes probable

A customer has sued Entity X, seeking damages for injury the customer allegedly sustained from using a product sold by Entity X. Entity X disputes liability on grounds that the customer did not follow directions in using the product. Up to the date the board authorised the financial statements for the year to 31 December 20X5 for issue, the entity's lawyers advise that it is probable that the entity will not be found liable. However, when the entity prepares the financial statements for the year to 31 December 20X6, its lawyers advise that, owing to developments in the case, it is now probable that the entity will be found liable.

At 31 December 20X5, no provision is recognised and the matter is disclosed as a contingent liability unless the probability of any outflow is regarded as remote. On the basis of evidence available when the financial statements were approved, there is no obligation as a result of a past event.

At 31 December 20X6, a provision is recognised for the best estimate of the amount required to settle the obligation as at that date. The fact that an outflow of economic benefits is now believed to be probable means that there is a present obligation. The expense is recognised in profit or loss. It is not a correction of an error in 20X5 because, on the basis of the evidence available when the 20X5 financial statements were approved, a provision must not have been recognised at that time.

The requirement to recognise the effect of changing circumstances in the period in which the change occurs extends to the analysis of information available after the end of the reporting period and before the date of approval of the financial statements. Section 32 includes as a specific example of an adjusting event "...The settlement after the reporting period of a court case that confirms that the entity had a present obligation at the end of the reporting period...". It notes that the entity adjusts any previously recognised provision related to this court case in accordance with Section 21 or recognises a new provision and does not merely disclose a contingent liability. [FRS 102.32.5(a)].

3.5 Contingent assets

A contingent asset is defined as a "...possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity". [FRS 102 Appendix I]. In contrast to the case of contingent liabilities (see 3.4 above), the word 'possible' in the context of contingent assets is not confined to a probability level of 50% or less because Section 21 states that a contingent asset must never be recognised. [FRS 102.21.13].

Extract from Section 21

21.13 An entity shall not recognise a contingent asset as an asset. Disclosure of a contingent asset is required by paragraph 21.16 when an inflow of economic benefits is probable. However, when the flow of future economic benefits to the entity is virtually certain, then the related asset is not a contingent asset, and its recognition is appropriate. [FRS 102.21.13].

Only when the flow of economic benefits to the entity is virtually certain is the related asset not contingent and capable of recognition. [FRS 102.21.13]. 'Virtually certain' is not defined in FRS 102, but it is certainly a much higher hurdle than 'probable' and indeed more challenging than the term 'highly probable', defined in FRS 102 as "Significantly more likely than probable". [FRS 102 Appendix I]. We believe it's reasonable that virtual certainty is interpreted as being as close to 100% as to make any remaining uncertainty insignificant.

Contingent assets are disclosed when an inflow of economic benefits is probable, [FRS 102.21.13], with 'probable' meaning 'more likely than not'. [FRS 102 Appendix I]. The disclosure requirements for contingent assets are discussed at 4.3 below.

As with contingent liabilities, we would expect contingent assets to be assessed continually to ensure that developments are appropriately reflected in the financial statements. If it has become virtually certain that an inflow of economic benefits will arise, the asset and the related income must be recognised in the period in which the change occurs. If a previously unlikely inflow becomes probable, then the contingent asset must be disclosed. [FRS 102.21.16].

The requirement to recognise the effect of changing circumstances in the period in which the change occurs extends to the analysis of information available after the end of the reporting period and before the date of approval of the financial statements. However, in contrast to contingent liabilities, no adjustment is made to reflect the subsequent settlement of a legal claim in favour of the entity. In this instance, the period in which the change occurs is subsequent to the reporting period. There is no suggestion that the example in paragraph 5(a) of Section 32 is referring to anything but liabilities. Paragraph 7 of Section 32 notes that an amount that becomes receivable due to a favourable judgement or settlement of a court case

after the reporting date but before the financial statements are authorised for issue is a contingent asset at the reporting date, and that disclosure may be required by paragraph 16 of Section 21. However, agreement on the amount of damages for a judgement that was reached before the reporting date, but was not previously recognised because the amount could not be measured reliably, may constitute an adjusting event. [FRS 102.32.7(b)].

3.5.1 Obligations contingent on the successful recovery of a contingent asset

Entities may sometimes be required to pay contingent fees to a third-party dependent upon the successful recovery of a contingent asset. For example, the payment of fees to a legal advisor in a contract agreed on a 'no win, no fee' basis will depend upon the successful outcome of a legal claim.

How we see it

Where entities are required to pay contingent fees to a third party, dependent upon the successful recovery of a contingent asset, the obligation for the success fee arises from an executory contract that must be evaluated separately from the legal claim. The liability for the success fee would therefore only be recognised by the entity upon winning the claim.

Section 21 uses the term executory contracts to mean "contracts under which neither party has performed any obligations or both parties have partially performed their obligations to an equal extent".

[FRS 102.21.1B(c)]. When payment for a contract for services is wholly contingent on recovering a contingent asset, no service requiring payment is deemed to be provided until or unless the matter is resolved successfully. Unless the contract also required payment to be made in the event of failure, the amount of work put in by the lawyer to prepare a case and argue for recovery of the contingent asset is irrelevant to the existence of a liability to pay fees.

If the entity has deemed it appropriate to recognise an asset in respect of the claim, it would be appropriate to take account of any such fees in the measurement of that asset (in determining the net amount recoverable); but no accrual is made for the legal fees themselves unless a successful outcome is confirmed.

This analysis is specific to a no win-no fee arrangement related to a contingent asset and may not be appropriate in other circumstances.

3.6 How probability determines whether to recognise or disclose

The following matrix summarises the treatment of contingencies under Section 21:

Likelihood of outcome	Accounting treatment: contingent liability	Accounting treatment: contingent asset
Virtually certain	Recognise	Recognise
Probable	Recognise	Disclose
Possible, but not probable	Disclose	No disclosure permitted
Remote	No disclosure required	No disclosure permitted

FRS 102 does not put a numerical measure of probability on either 'virtually certain' or 'remote'. In our view, the use of such measures would downgrade a process requiring the exercise of judgement into a mechanical exercise. It is difficult to imagine circumstances when an entity could reliably determine an obligation to be, for example, 92%, 95% or 99% likely, let alone be able to compare those probabilities objectively.

How we see it

We think it is reasonable to regard 'virtually certain' as describing a likelihood that is as close to 100% as to make any remaining uncertainty insignificant; to see 'remote' as meaning a likelihood of an outflow of resources that is not significant; and for significance to be a matter for judgement and determined according to the merits of each case.

3.7 Recognising an asset when recognising a provision

In most cases, the recognition of a provision results in an immediate expense in profit or loss. Nevertheless, in some cases it will be appropriate to recognise an asset. These issues are not discussed in Section 21, which neither prohibits nor requires capitalisation of the costs recognised when a provision is made. It states that the amount of the provision is expense, unless another Section of FRS 102 requires the cost to be recognised as part of the cost of an asset such as inventories or property, plant and equipment.

[FRS 102.21.5].

Section 17 states that the cost of an item of property, plant and equipment includes the initial estimate of the costs, recognised and measured in accordance with Section 21, of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period. [FRS 102.17.10].

The treatment of decommissioning costs is discussed further in 3.11.1 below.

3.8 Initial measurement

3.8.1 Best estimate of provision

Except in the case of an onerous contract, the amount required to be recognised as a provision is the best estimate of the expenditure required to settle the present obligation at the end of the reporting period. [FRS 102.21.7]. In the case of an onerous contract, the amount required to be recognised as a provision is not based on an estimate of an expected outcome. Instead, the provision reflects the lower of the costs of fulfilling the contract and any compensation or penalties from a failure to fulfil it [FRS 102.21A.2], regardless of what the entity expects to do. Onerous contracts are discussed in 3.3.1 above.

The best estimate of the amount required to settle the obligation at the reporting date is the amount an entity would rationally pay to settle the obligation at the end of the reporting period or to transfer it to a third party at that time. [FRS 102.21.7].

Extract from Section 21

- 21.7** An entity shall measure a provision at the best estimate of the amount required to settle the obligation at the reporting date. The best estimate is the amount an entity would rationally pay to settle the obligation at the end of the reporting period or to transfer it to a third party at that time.
- (a) When the provision involves a large population of items, the estimate of the amount reflects the weighting of all possible outcomes by their associated probabilities. Where there is a continuous range of possible outcomes, and each point in that range is as likely as any other, the mid-point of the range is used.
 - (b) When the provision arises from a single obligation, the individual most likely outcome may be the best estimate of the amount required to settle the obligation. However, even in such a case, the entity considers other possible outcomes. When other possible outcomes are either mostly higher or mostly lower than the most likely outcome, the best estimate will be a higher or lower amount.

When the effect of the time value of money is material, the amount of a provision shall be the present value of the amount expected to be required to settle the obligation. The discount rate (or rates) shall be a pre-tax rate (or rates) that reflect(s) current market assessments of the time value of money and risks specific to the liability. The risks specific to the liability shall be reflected either in the discount rate or in the estimation of the amounts required to settle the obligation, but not both.

As can be seen above, paragraph 7 of Section 21 states that the best estimate of the amount required to settle the obligation is the amount that an entity would rationally pay to settle the obligation at the end of the reporting period (implying a 'fulfilment value' measurement basis), or transfer it to a third party (suggesting a 'transfer value' measurement basis). The assumptions that an entity makes regarding derecognition of the liability could influence how the entity determines the best estimate of the expenditure required to settle the obligation. In practice, there are several ways in which an obligation recognised in accordance with Section 21 could be derecognised. For example:

- The obligation is settled by the entity performing the obligation itself (for example, the entity uses its own personnel to clean up a site to satisfy an environmental clean-up obligation).

- The entity employs a third party to perform the work required to settle the obligation (for example, the entity hires a third-party company to clean up the site).
- The entity transfers the obligation to a third party (for example, another entity takes on the obligation to clean up the site, the entity pays the transferee and is relieved of the obligation).

Or

- The obligation is cash settled by negotiation with the party to whom the obligation is owed (for example, the entity negotiates a cash settlement with the local municipality in order to be relieved of the obligation).

In our view, any of the assumptions above are acceptable basis for measurement provided that they appropriately reflect the facts and circumstances of the situation. If an entity exercises significant judgement in determining the most appropriate approach, consideration must be given to the disclosure requirements in paragraph 6 of Section 8 *Notes to the Financial Statements*. See Chapter 6 at 7.3.

How we see it

The assumptions that an entity makes regarding how an obligation recognised in accordance with Section 21 will be derecognised could influence how the entity determines the best estimate of the expenditure required to settle the obligation. We believe that this is acceptable, provided that the measurement basis appropriately reflects the facts and circumstances of the situation.

It is implicit in the definition of a provision that there are often uncertainties around the amount of the outflow required by an entity. Section 21 sets out different approaches to dealing with these uncertainties in arriving at an estimate of the provision, depending upon whether it arises from a single obligation or from a large population of items.

Where a provision arises from a single obligation, the individual most likely outcome may be the best estimate of the amount required to settle the obligation. However, even in such a case, the other possible outcomes must be considered. When the other possible outcomes are mostly higher than the most likely outcome, the best estimate will be higher than the individual most likely amount. Conversely, when other possible outcomes are mostly lower, the best estimate will be lower than the individual most likely amount. [FRS 102.21.7(b)]. In effect, this adjustment builds into the measure of the provision an allowance to reflect the risk that the actual outcome is an amount other than the individual most likely outcome.

When the provision involves a large population of items, the best estimate of the amount required to settle the obligation reflects the weighting of all possible outcomes by their associated probabilities, i.e., a probability-weighted expected value calculation is performed. [FRS 102.21.7(a)]. This method is illustrated by Example 4 in the Appendix to Section 21, which considers the estimation of a provision for product warranties, as set out below. [FRS 102.21A.4].

Illustration 3-8: Calculation of expected value: warranties

A manufacturer gives warranties at the time of sale to purchasers of its product. Under the terms of the contract for sale, the manufacturer undertakes to make good, by repair or replacement, manufacturing defects that become apparent within three years from the date of sale. On the basis of experience, it is probable that there will be some claims under the warranties. Accordingly, it is determined that the obligating event is the sale of a product with a warranty and an outflow of resources in settlement is probable for the warranties as a whole (i.e., it is more likely than not that the manufacturer will have to settle some warranties given on past sales). The entity therefore recognises a provision for the best estimate of the costs of making good under the warranty products sold before the reporting date.

In 2026, goods are sold for £1,000,000. Experience indicates that 90 per cent of products sold require no warranty repairs; 6 per cent of products require minor repairs costing 30 per cent of the sale price; and 4 per cent of products require major repairs or replacement costing 70 per cent of sale price. Therefore, estimated warranty costs are:

Possible outcome	Probability weighted cost	Expected value (£)
No repair required	$£1,000,000 \times 90\% \times 0$	0
Minor repairs	$£1,000,000 \times 6\% \times 30\%$	18,000
Major repairs	$£1,000,000 \times 4\% \times 70\%$	28,000
Expected value		46,000

Where the provision involves a large population of items and there is a continuous range of possible outcomes, and each point in that range is as likely as any other, the mid-point of the range is used as the best estimate of the amount required to settle the obligation. [FRS 102.21.7(a)].

3.8.2 Discounting the estimated cash flows to a present value

When the effect of the time value of money is material, the amount of a provision is the present value of the amount expected to be required to settle the obligation. The discount rate (or rates) must be a pre-tax rate (or rates) that reflect(s) current market assessments of the time value of money and the risks specific to the liability. The risks specific to the liability must be reflected either in the discount rate or in the estimation of the amounts required to settle the obligation, but not both. [FRS 102.21.7].

This requirement is illustrated in the following example taken from the Appendix to Section 21.

[FRS 102.21A.4].

Illustration 3-9: Discounting the estimated cash flows to a present value

The fact pattern is the same as Illustration 3-8 above, with the probability-weighted estimate of total warranty costs for goods sold in 20X6 expected to be £46,000. In this case, the expenditures for warranty repairs and replacements are expected to be made 60% per cent in 20X7, 30% per cent in 20X8 and 10 per cent in 20X9, in each case at the end of the period. Because the estimated cash flows already reflect the probabilities of the cash outflows, and assuming there are no other risks or uncertainties that must be reflected, to determine the present value of those cash flows the entity uses a 'risk-free' discount rate based on national government bonds with the same term as the expected cash outflows (6 per cent for one-year bonds and 7 per-cent for two-year and three-year bonds). Calculation of the present value, at the end of 20X6, of the estimated cash flows related to the warranties for products sold in 20X6 is as follows:

Year		Expected cash payments (£)	Discount rate	Discount factor	Present value (£)
1	60% × £46,000	27,600	6%	0.9434 (at 6% for 1 year)	26,038
2	30% × £46,000	13,800	7%	0.8734 (at 7% for 2 years)	12,053
3	10% × £46,000	4,600	7%	0.8163 (at 7% for 3 years)	3,755
Present value					41,846

The entity will recognise a warranty obligation of £41,846 at the end of 20X6 for products sold in 20X6.

FRS 102 gives no further guidance on how an entity determines the appropriate discount rate to use. However, the example above refers to a government bond rate with a similar term as the related obligation. This is consistent with the application of similar requirements in IAS 37.

The main types of provision where the impact of discounting will be significant are those relating to decommissioning and other environmental restoration liabilities, which are discussed at 3.11.1 and 3.11.2 below.

3.8.2.A Real or nominal rate

Section 21 does not indicate whether the discount rate must be a real discount rate or a nominal discount rate. The discount rate to be used depends on whether:

- The future cash flows are expressed in current prices, in which case a real discount rate (which excludes the effects of general inflation) is used.
- Or
- The future cash flows are expressed in expected future prices, in which case a nominal discount rate (which includes a return to cover expected inflation) is used.

Either alternative is acceptable, and these methods may produce the same amount for the initial present value of the provision. However, the effect of the unwinding of the discount will be different in each case (see 3.9.1 below).

3.8.2.B Adjusting for risk and using a government bond rate

Section 21 requires that risk is taken into account in the calculation of a provision but gives little guidance as to how this is done. It merely states that the risks specific to the liability is reflected in either the discount rate or in the estimate of the amounts required to settle the obligation, but not in both.

[FRS 102.21.7]. One may use a discount rate that reflects the risk associated with the liability (a risk-adjusted rate). The following example shows how an entity might calculate such a risk adjusted rate.

Illustration 3-10: Calculation of a risk-adjusted rate

A company has a provision for which the expected value of the cash outflow in three years time is £250, and the risk-free rate (i.e., the nominal rate unadjusted for risk) is 5%. However, the possible outcomes lie within a range between £200 and £300. As the company is risk averse, management would settle instead for a certain payment of £270 in three years time rather than be exposed to the risk of the actual outcome being as high as £300. The effect of risk in calculating the present value can be expressed as either:

- Discounting the risk-adjusted cash flow of £270 at the risk-free (unadjusted) rate of 5%, giving a present value of £233.
- Or
- Discounting the expected cash flow (which is unadjusted for risk) of £250 at a risk-adjusted rate that will give the present value of £233, i.e., a rate of 2.35%.

As can be seen from this example, the risk-adjusted discount rate is a 'lower' rate than the unadjusted (risk-free) discount rate. This may seem counter-intuitive initially, because the experience of most borrowers is that banks and other lenders will charge a higher rate of interest on loans that are assessed to be higher risk to the lender. However, in the case of a provision a risk premium is being suffered to eliminate the possibility of the actual cost being higher (thereby capping a liability), whereas in the case of a loan receivable a premium is required to compensate the lender for taking on the risk of not recovering its full value (setting a floor for the value of the lenders financial asset). In both cases the actual cash flows incurred by the paying entity are higher to reflect a premium for risk. In other words, the discount rate for an asset is increased to reflect the risk of recovering less and the discount rate for a liability is reduced to reflect the risk of paying more.

A problem with changing the discount rate to account for risk is that this adjusted rate is a theoretical rate, as it is unlikely that there would be a market assessment of the risks specific to the liability alone.

[FRS 102.21.7]. However, the lower discount rate in the above example is consistent with the premise that a risk-adjusted liability is higher than a liability without accounting for the risk that the actual settlement amount is different to the estimate. It is also difficult to see how a risk-adjusted rate could be obtained in practice. In the above Illustration, it was obtained only by reverse-engineering; it was already known that the net present value of a risk-adjusted liability was £233, so the risk-adjusted rate was just the discount rate applied to unadjusted cash flow of £250 to give that result.

The alternative approach, to adjust the cash flows instead of using a risk-adjusted discount rate, [FRS 102.21.7], is conceptually more straightforward, but still presents the problem of how to adjust the cash flows for risk. It could be inferred from Illustration 3-8 at 3.8.1 above that estimated cash flows which reflect the probabilities of cash outflows represent risk adjusted cash flows. However, whilst a best estimate based solely on the expected value approach or the mid-point of a range addresses the uncertainties relating to there being a variety of possible outcomes, it does not fully reflect risk, because the actual outcome could still be higher or lower than the estimate. Nevertheless, adjusting estimated cash flows to reflect risk may be easier than attempting to risk-adjust the discount rate.

Where the risks specific to the liability are reflected in the estimated cash flows, they must not also be included in the discount rate. [FRS 102.21.7]. The discount rate to be applied in this case must therefore be a risk-free rate. As suggested in Illustration 3-9 at 3.8.2 above, it would be appropriate to apply a national government bond rate with a similar currency and remaining term as the provision. It follows that because a risk-adjusted rate is always lower than the risk-free rate, an entity cannot justify the discounting of a provision at a rate higher than a government bond rate with a similar currency and term as the provision.

In recent years, government bond rates have been more volatile as markets have changed rates to reflect (among other factors) heightened perceptions of sovereign debt risk. Several years ago, it was not uncommon for government debt to offer negative yields. It is now much less common. The question has therefore arisen whether government bond rates, at least in certain jurisdictions, should continue to be regarded as the default measure of a risk-free discount rate. Whilst the current volatility in rates has highlighted the fact that no debt (even government debt) is totally risk free, the challenge is to find a more

reliable measure as an alternative. Any adjustment to the government bond rate to 'remove' the estimate of sovereign debt risk is conceptually flawed, as it not possible to isolate one component of risk from all the other variables that influence the setting of an interest rate. Another approach might be to apply some form of average bond rate over a period of 3, 6 or 12 months to mitigate the volatility inherent in applying the spot rate at the period end. However, this is clearly inappropriate given the requirements in Section 21 to determine the best estimate of an obligation by reference to the expenditure required to settle it 'at the reporting date' [FRS 102.21.7] and to determine the discount rate on the basis of 'current market assessments' of the time value of money. [FRS 102.21.7].

With 'risk' being a measure of potential variability in returns, it remains the case that in most countries a government bond will be subject to the lowest level of variability in that jurisdiction. As such, it normally remains the most suitable of all the observable measures of the time value of money in a particular country. When government bond rates are negative or, more likely, result in a negative discount rate once adjusted for risk, we believe that it is not appropriate to apply a floor of zero to the discount rate as this would result in an understatement of the liability. As discussed above, and at 3.8.2.A above, there are various approaches to determining an appropriate discount rate. It may sometimes be the case that one or more of the acceptable approaches result in a negative discount rate whereas the application of an alternative permitted approach would not. In order to avoid some of the presentational difficulties associated with a negative discount rate, entities faced with a negative real discount rate before risk adjustment may wish to consider the alternative approach of discounting expected future cash flows expressed in future prices, at a nominal discount rate (see 3.8.2.A above), if the nominal rate is not negative. Similarly, entities that are faced with a negative risk-adjusted discount rate only because of risk adjustment (i.e., where risk free rates themselves are not negative) may wish to adopt the alternative approach of adjusting the estimated future cash flows to reflect the risks associated with the liability, rather than risk-adjusting the discount rate.

How we see it

Even as government bond rates have become more volatile in recent years, in most countries a government bond remains the most suitable of all the observable measures of the time value of money in a particular country. It follows that because a risk-adjusted rate is always lower than the risk-free rate, an entity cannot justify the discounting of a provision at a rate that is higher than a government bond rate with a similar currency and term to the provision.

Where government bond rates are negative or, more likely, result in a negative discount rate once adjusted for risk, we believe that it is not appropriate to apply a floor of zero to the discount rate as this would result in an understatement of the liability.

3.8.2.C Own credit risk

Section 21 does not address whether an entity's own credit risk is a risk-specific to a liability when determining a risk-adjusted discount rate. However, predominant practice is to exclude it for the reason that credit risk is generally viewed as a risk of the entity rather than a risk specific to the liability.

[FRS 102.21.7].

How we see it

Whether own credit risk is considered a risk specific to a liability could depend, at least in part, on the way in which an entity measures a provision (i.e., how an entity determines the best estimate of the expenditure required to settle the obligation).

As discussed in 3.8.1 above, the measurement objective in Section 21 is not precise, and the term 'best estimate' can be interpreted in different ways. For example, an entity could determine the best estimate by assuming that the obligation will be cash settled by negotiation with the party to whom the obligation is owed. In this case, own credit risk could be considered relevant if the party to whom the obligation is owed would be willing to negotiate a lower settlement amount if the entity risks defaulting in the future. If an entity has exercised significant judgement in determining the best estimate of the expenditure required to settle an obligation, and whether own credit risk is taken into account, consideration must be given to the disclosure requirements in paragraph 6 of Section 8. See Chapter 6 at 7.3.

3.8.3 Anticipating future events that may affect the estimate of cash flows

The amount that an entity expects will be required to settle an obligation in future may depend upon expectations and assumptions concerning future events, such as changes in legislation or technological advances. Section 21 does not address the extent to which such expectations are built into an entity's best estimate of the amount required to settle the obligation. IAS 37 provides guidance in this area. Given the consistent principles of Section 21 and IAS 37 regarding the measurement of provisions, entities may look to IAS 37 for further guidance based on the hierarchy set out in Section 10 (See Chapter 9 at 3.1). IAS 37 states that "Future events that may affect the amount required to settle an obligation shall be reflected in the amount of a provision where there is sufficient objective evidence that they will occur". [IAS 37.48].

The requirement for objective evidence means that it is not appropriate to reduce the best estimate of future cash flows simply by assuming that a completely new technology will be developed before the liability is required to be settled. There will need to be sufficient objective evidence that such future developments are likely. For example, an entity may believe that the cost of cleaning up a site at the end of its life will be reduced by future changes in technology. The amount recognised must reflect a reasonable expectation of technically qualified, objective observers, taking account of all available evidence as to the technology that will be available at the time of the clean-up. It would be appropriate to include, for example, expected cost reductions associated with increased experience in applying existing technology. [IAS 37.49].

Similarly, if new legislation is to be anticipated, IAS 37 requires that there needs to be evidence both of what the legislation will demand and whether it is virtually certain to be enacted and implemented. In many cases sufficient objective evidence will not exist until the new legislation is enacted. [IAS 37.50].

These requirements are most likely to impact provisions for liabilities that will be settled some distance in the future, such as decommissioning costs (see 3.11.1 below).

3.8.4 Provisions must exclude gains on expected disposal of assets

An entity excludes gains from the expected disposal of assets from the measurement of a provision. [FRS 102.21.8]. Such gains are instead recognised at the time specified by the relevant Section of FRS 102 dealing with the assets concerned. This is likely to be of particular relevance in relation to restructuring provisions which are discussed at 3.3.2 above.

3.8.5 Reimbursement of amounts required to settle a provision

An entity may sometimes be reimbursed all or part of an amount required to settle a provision, for example through an insurance claim. The reimbursement must be recognised only when it is virtually certain that the entity will receive the reimbursement on settlement of the obligation. [FRS 102.21.9]. It must be recognised as an asset in the statement of financial position and must not be offset against the provision. [FRS 102.21.9]. However, the expense relating to a provision can be presented net of reimbursement in the income statement or statement of comprehensive income. [FRS 102.21.9]. The amount recognised for the reimbursement must not exceed the amount of the provision. [FRS 102.21.9].

Except when an obligation is determined to be joint and several (see 3.8.6 below), any form of net presentation in the balance sheet is prohibited. This is because the entity would remain liable for the whole cost if the third party failed to pay for any reason, for example as a result of the third party's insolvency.

3.8.6 Joint and several liability

When an entity is jointly and severally liable for an obligation, it recognises only its own share of the obligation, based on the amount that it is probable that the entity will pay. The remainder that is expected to be met by other parties is treated as a contingent liability. [FRS 102.21.12].

Arguably, the economic position in the case of joint and several liability is no different than if the entity was liable for the whole obligation but expected to be reimbursed part of the amount required to settle the provision under the terms of an insurance contract. In both cases, the entity is exposed to further loss in the event that the other parties are unable or unwilling to pay. However, in the case of joint and several liability, the entity and the parties with whom it shares liability each have a direct (albeit shared) obligation for the past event. This contrasts with the case where the entity expects to be reimbursed part of the amount required to settle a provision by an insurance company. In this case, the insurance company from whom the reimbursement is expected has a contractual relationship only with the entity and has no direct obligation for the past event itself. Accordingly, any disclosed liability is not reduced on the basis that the entity holds valid insurance against the obligation.

3.9 Subsequent measurement of provisions

After initial recognition, provisions must be reviewed at each reporting date and adjusted to reflect the current best estimate of the amount required to settle the obligation. [FRS 102.21.11]. Any adjustments to the amounts previously recognised are recognised in profit or loss unless the provision was originally recognised as part of the cost of an asset. [FRS 102.21.11].

An entity must charge against a provision only those expenditures for which the provision was originally recognised. [FRS 102.21.10]. Therefore, if a provision is no longer required, the amount of the provision must be reversed. Provisions may not be redesignated or used for expenses for which the provision was not originally recognised.

When a provision is measured at the present value of the amount required to settle the obligation, the unwinding of the discount is recognised as a finance cost in profit or loss in the period it arises. [FRS 102.21.11]. However, the amount of finance cost recognised as an unwinding of the discount depends upon whether the provision has been discounted at a real or a nominal rate, and also whether the entity has used a risk-free or risk-adjusted discount rate. This is not addressed by Section 21 but is discussed at 3.9.1 and 3.9.2 below. In addition, Section 21 provides no guidance on the effect of changes in interest rates on the discount rates applied. This is discussed at 3.9.3 below.

3.9.1 Unwinding of the discount: impact of using real or nominal discount rates

As discussed at 3.8.2.A above, Section 21 provides no guidance on whether a real or nominal discount rate must be used to discount a provision. Whilst both methods may produce the same figure for the initial present value of the provision, the effect of the unwinding of the discount will be different in each case. This is best illustrated by way of an example.

Illustration 3-11: Effect on future profits of choosing a real or nominal discount rate

A provision is required to be set up for an expected cash outflow of £100,000 (estimated at current prices), payable in three years' time. The appropriate nominal discount rate is 7.5%, and inflation is estimated at 5%. If the provision is discounted using the nominal rate, the expected cash outflow must reflect future prices. Accordingly, if prices increase at the rate of inflation, the cash outflow will be £115,762 ($£100,000 \times 1.05^3$). The net present value of £115,762, discounted at 7.5%, is £93,184 ($£115,762 \times 1 \div (1.075)^3$). If all assumptions remain valid throughout the three-year period, the movement in the provision would be as follows:

	Undiscounted cash flows	Provision
	£	£
Year 0	115,762	93,184
Unwinding of discount ($£93,184 \times 0.075$)		6,989
Revision to estimate		-
Year 1	115,762	100,173
Unwinding of discount ($£100,173 \times 0.075$)		7,513
Revision to estimate		-
Year 2	115,762	107,686
Unwinding of discount ($£107,686 \times 0.075$)		8,076
Revision to estimate		-
Year 3	115,762	115,762

If the provision is calculated based on the expected cash outflow of £100,000 (estimated at current prices), then it needs to be discounted using a real discount rate. This may be thought to be 2.5%, being the difference between the nominal rate of 7.5% and the inflation rate of 5%. However, it is more accurately calculated as 2.381%, being $(1.075 \div 1.05) - 1$. Accordingly, the net present value of £100,000, discounted at 2.381%, is £93,184 ($£100,000 \times 1 \div (1.02381)^3$), the same as the calculation using future prices discounted at the nominal rate.

If all assumptions remain valid throughout the three-year period, the movement in the provision would be as follows:

	Undiscounted cash flows	Provision
	£	£
Year 0	100,000	93,184
Unwinding of discount ($£93,184 \times 0.02381$)		2,219
Revision to estimate ($£100,000 \times 0.05$)	5,000	4,770
Year 1	105,000	100,173
Unwinding of discount ($£100,173 \times 0.02381$)		2,385
Revision to estimate ($£105,000 \times 0.05$)	5,250	5,128
Year 2	110,250	107,686
Unwinding of discount ($£107,686 \times 0.02381$)		2,564
Revision to estimate ($£110,250 \times 0.05$)	5,512	5,512
Year 3	115,762	115,762

Although the total expense in each year is the same under either method, what will be different is the allocation of the change in provision between operating costs (assuming the original provision was treated as an operating expense) and finance charges. It can be seen from the second table in the above example that using the real discount rate will give rise to a much lower finance charge each year. However, this does not lead to a lower provision in the balance sheet at the end of each year. Provisions must be revised annually to reflect the current best estimate of the amount required to settle the obligation. [FRS 102.21.11]. Thus, the provision in the above example at the end of each year needs to be adjusted to reflect current prices at that time (and any other adjustments that arise from changes in the estimate of the provision), as well as being adjusted for the unwinding of the discount. For example, the revised provision at the end of Year 1 is £100,173, being £105,000 discounted for two years at 2.381%. After allowing for the unwinding of the discount, this required an additional provision of £4,770.

A more significant difference will arise where the recognition of the original provision is included as part of the cost of property, plant or equipment, rather than as an expense, such as when a decommissioning provision is recognised. In that case, using a real discount rate will result initially in a lower charge to the income statement, since Section 21 requires any revision to the estimate of the provision is not taken to the income statement when the provision was originally recognised as part of the cost of an asset [FRS 102.21.11].

3.9.2 Unwinding of the discount: impact of using risk-free or risk-adjusted discount rates

The decision made by an entity to use a risk-free or risk-adjusted discount rate impacts on the unwinding of the discount and the amount recognised in finance costs in respect of the unwind. This is illustrated in the following Illustration:

Illustration 3-12: Effect on future profits of choosing a risk-free or risk-adjusted discount rate

A company is required to make a provision for which the expected value of the cash outflow in three years' time is £150, when the risk-free rate (i.e., the rate unadjusted for risk) is 5%. However, the possible outcomes from which the expected value has been determined lie within a range between £100 and £200. The reporting entity is risk averse and would settle instead for a certain payment of, say, £160 in three years' time rather than be exposed to the risk of the actual outcome being as high as £200. The measurement options to account for risk can be expressed as either:

- Discounting the risk-adjusted cash flow of £160 at the risk-free (unadjusted) rate of 5%, giving a present value of £138
- Or
- Discounting the expected cash flow (which is unadjusted for risk) of £150 at a risk-adjusted rate that will give the present value of £138, i.e., a rate of 2.8%

If no changes in estimate were made to the provision during the three-year period, the first alternative above will unwind to give an overall finance charge of £22 and a final provision of £160. The second alternative will unwind to give an overall finance charge of £12 and a final provision of £150.

In Illustration 3-12 above, the unwinding of different discount rates gives rise to different provisions. The difference of £10 (£22 - £12) relates to the risk adjustment that has been made to the provision. As the actual date of settlement comes closer, the estimates of the range of possible outcomes (and accordingly the expected value of the outflow) and the premium the entity would accept for certainty will converge. As such, the effect of any initial difference related to the decision to apply a risk-free or risk-adjusted rate will be lost in the other estimation adjustments that would be made over time.

3.9.3 The effect of changes in interest rates on the discount rate applied

Section 21 requires the discount rate to reflect current market assessments of the time value of money. [FRS 102.21.7]. It follows that where interest rates change, the provision must be recalculated on the basis of revised interest rates. This will give rise to an adjustment to the carrying value of the provision, but Section 21 does not address how this is classified in the income statement. We believe that the adjustment to the provision is a change in accounting estimate, as defined in Section 10 and discussed in Chapter 9 at 3.1. Accordingly, it will be reflected in the line item of the income statement (or statement of comprehensive income if presented) in which the expense establishing the provision was originally recorded. Where the original provision was recorded as part of the cost of an asset such as inventory or property, plant and equipment, the effect of any subsequent adjustment to discount rates is added to or deducted from the cost of the asset to which the provision relates.

Calculating this adjustment is not straightforward either, because Section 21 gives no guidance on how it must be done. For example, must the new discount rate be applied during the year or just at the year-end and must the rate be applied to the new estimate of the provision or the old estimate? Because Section 21 requires the value of a provision to reflect the best estimate of the expenditure required to settle the obligation to be assessed as at the end of the reporting period, [FRS 102.21.7], a change in the discount rate is applied prospectively from the end of the reporting period. This is illustrated in the following example:

Illustration 3-13: Accounting for the effect of changes in the discount rate

A provision is required to be set up for an expected cash outflow of £100,000 (estimated at current prices), payable in three years' time. The appropriate nominal discount rate is 7.5%, and inflation is estimated at 5%. At future prices the cash outflow will be £115,762 (£100,000 × 1.05³). The net present value of £115,762, discounted at 7.5%, is £93,184 (£115,762 × 1 ÷ (1.075)³).

At the end of Year 2, all assumptions remain valid, except it is determined that a current market assessment of the time value of money and the risks specific to the liability would require a decrease in the discount rate to 6.5%. Accordingly, at the end of Year 2, the revised net present value of £115,762, discounted at 6.5%, is £108,697 (£115,762 ÷ 1.065).

The movement in the provision would be reflected as follows:

	Undiscounted cash flows	Provision
	£	£
Year 0	115,762	93,184
Unwinding of discount (£93,184 × 0.075)		6,989
Revision to estimate		-
Year 1	115,762	100,173
Unwinding of discount (£100,173 × 0.075)		7,513
	115,762	107,686
Revision to estimate (£108,697 - £107,686)		1,011
Year 2	115,762	108,697
Unwinding of discount (£108,697 × 0.065)		7,065
Revision to estimate		-
Year 3	115,762	115,762

In Year 2, the finance charge is based on the previous estimate of the discount rate and the revision to the estimate of the provision would be charged to the same line item in the income statement that was used to establish the provision of £93,184 at the start of Year 1.

3.10 Funding commitments (other than loan commitments)

The requirements of FRS 102 regarding funding commitments are set out in Section 34 *Specialised Activities*, rather than in Section 21. Nevertheless, an entity is required to consider the requirements of both Section 21 and Section 2 when accounting for funding commitments. [FRS 102.34.58]. This does not apply to financial instruments, including loan commitments, which fall within the scope of Section 11 and Section 12. [FRS 102.34.57].

3.10.1 Recognition of a funding commitment as a liability

Section 34 requires that an entity recognises a liability and, usually, a corresponding expense, when it has made a commitment that it will provide resources to another party, if, and only if:

- The definition and recognition criteria for a liability have been satisfied.
- The obligation (which may be a constructive obligation) is such that the entity cannot realistically withdraw from it.

And

- The entitlement of the other party to the resources does not depend on the satisfaction of performance-related conditions. [FRS 102.34.59].

The definition of a liability requires that there be a present obligation, and not merely an expectation of a future outflow. [FRS 102.34A.1]. A general statement that the entity intends to provide resources to certain classes of potential beneficiaries in accordance with its objectives does not in itself give rise to a liability, as the entity may amend or withdraw its policy, and potential beneficiaries do not have the ability to insist on their fulfilment. Similarly, a promise to provide cash conditional on the receipt of future income in itself may not give rise to a liability where the entity cannot be required to fulfil it if the future income is not received and it is probable that the economic benefits will not be transferred. [FRS 102.34A.2].

A liability is recognised only for a commitment that gives the recipient a valid expectation that payment will be made and from which the grantor cannot realistically withdraw. One of the implications of this is that a liability only exists where the commitment has been communicated to the recipient. [FRS 102.34A.3].

Commitments that are performance-related will be recognised when those performance-related conditions are met. [FRS 102.34.60]. Performance-related conditions are defined in FRS 102 as conditions under which entitlement to resources is conditional on the performance of a specified activity or a particular level of service or units of output to be delivered. [FRS 102 Appendix I]. Commitments are not recognised if they are subject to performance-related conditions. In such a case, the entity is required to fulfil its commitment only when the performance-related conditions are met and no liability exists until that time. [FRS 102.34A.4].

A commitment may contain conditions that are not performance-related conditions. For example, a requirement to provide an annual financial report to the grantor may serve mainly as an administrative tool because failure to comply would not release the grantor from its commitment. This may be distinguished from a requirement to submit a detailed report for review and consideration by the grantor of how funds will be utilised in order to secure payment. A mere restriction on the specific purpose for which the funds are to be used does not in itself constitute a performance-related condition. [FRS 102.34A.5].

Whether an arrangement gives rise to a funding commitment and when such commitments are recognised is a matter of judgement based on the facts and circumstances of the case, as illustrated in Illustration 3-14 below.

Illustration 3-14: Accounting for donations to non-profit organisations

An entity decides to enter into an arrangement to 'donate' £1m in cash to a university. A number of different options are available for the arrangement and the entity's management want to determine whether the terms of these options make any difference to the timing, measurement or presentation of the £1m expenditure, as follows:

Option 1:

The entity enters into an unenforceable contract to contribute £1m for general purposes. The benefits to the entity are deemed only to relate to its reputation as a 'good corporate citizen'; the entity does not receive any consideration or significant benefit from the university in return for the donation.

Option 2:

As per Option 1 except the entity publishes a press release in relation to the donation and announcing that payment is to be made in equal instalments of £200,000 over 5 years.

Option 3:

As per Option 2, except that the contract is legally enforceable in the event that the entity does not pay all the instalments under the contract.

Option 4:

As per Option 2, except that the entity is only required to make the donation if the university raises £4m from other sources.

Option 5:

As per Option 2, except that the contract is legally enforceable and the funds will be used for research and development activities specified by the entity. The entity will retain proprietary rights over the results of the research.

Applying the requirements in respect of funding commitments discussed above:

- In Option 1, the contract is unenforceable, there is no announcement or conditions preceding payment and there is no exchange of benefits. Accordingly, an expense would be recognised only when the entity transfers cash to the university.
- For Option 2, it could be appropriate for the entity to conclude that the entity's announcement of the donation to be paid by instalments indicates that there is a constructive obligation because the entity has created a valid expectation that it will make all of the payments promised. Alternatively, it could determine that once the first instalment is paid, the entity has created a valid expectation that it will make the remaining payments. This is a matter of judgement. In this case the entity would recognise an expense and a liability, measured at the net present value of the 5 instalments of £200,000, at the point when it is determined that a constructive obligation exists.
- Option 3 involves an enforceable contract with no exchange of benefits. Therefore, a liability and an expense are recognised on signing the enforceable contract, measured at the present value of the 5 instalments of £200,000.
- Under Option 4, the contract is unenforceable and the donation is subject to a performance condition. In these circumstances, no liability exists until the performance condition is met (i.e., when the additional funds have been raised). [FRS 102.34.60]. Only then would a liability and expense be recognised, measured at the net present value of the £1m promised.
- Option 5 involves an enforceable contract which could give rise to a liability recognised when the contract is signed. However, there is an exchange of benefits relating to the research and development activities performed on behalf of the entity. Whether these benefits have a value close to the present value of the 5 instalments of £200,000 is a matter of judgement. If it is determined that this is an exchange transaction that is not onerous, the entity could regard the signing of the contract as executory and apply the criteria in Section 18 to determine whether an asset or expense could be recognised for the related research and development costs as incurred (see Chapter 21).

Where the arrangement gives rise to an exchange transaction rather than a donation, the expenditure incurred by the donor is recorded in accordance with the relevant Section of FRS 102. An exchange transaction is a reciprocal transfer in which each party receives and sacrifices approximately equal value. Assets and liabilities are not recognised until each party performs their obligations under the arrangement.

3.11 Other examples of provisions

Section 21 provides specific guidance in respect of a limited number of situations, which are discussed at 3.2.4. and 3.3 above. This Section considers other common provisions not addressed specifically by Section 21. As there is no specific guidance on accounting for these provisions within FRS 102, entities may, under the hierarchy set out in Section 10 (see Chapter 9 at 3.1) refer to the requirements and guidance of IFRS in formulating an appropriate accounting policy for these obligations.

3.11.1 Decommissioning provisions

Decommissioning costs arise when an entity is required to dismantle or remove an asset at the end of its useful life and to restore the site on which it has been located, for example, when an oil rig or nuclear power station reaches the end of its economic life.

Section 17 observes that the cost of an item of property, plant and equipment includes the initial estimate of the costs, recognised and measured in accordance with Section 21, of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period. [FRS 102.17.10(c)]. See Chapter 20 at 3.4.3. However, Section 21 provides no specific guidance on decommissioning provisions.

In IAS 37, the accounting for decommissioning costs is dealt with by way of an example relating to an oil rig in an offshore oilfield. A provision is recognised at the time of constructing the oil rig in relation to the eventual costs that relate to its removal and the restoration of damage caused by building it. This is because the construction of the asset (and the environmental damage caused by it) creates the past obliging event requiring restoration in the future. Additional provisions are recognised over the life of the oil field to reflect the need to reverse damage caused during the extraction of oil. The total decommissioning cost is estimated, discounted to its present value and it is this amount which forms the initial provision. This 'initial estimate of the costs of dismantling and removing the item and restoring the site' is added to the corresponding asset's cost. Thereafter, the asset is depreciated over its useful life, while the discounted provision is progressively unwound, with the unwinding charge shown as a finance cost.

How we see it

Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, we believe that this approach is also appropriate for entities reporting under FRS 102

Neither Section 21 nor Section 17 give guidance on accounting for changes in the decommissioning provision. Under IFRS, guidance is provided by IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities*.

IFRIC 1 applies to any decommissioning, restoration or similar liability that has been both included as part of the cost of an asset measured in accordance with IAS 16 or as part of the cost of a right-of-use asset in accordance with IFRS 16 and recognised as a liability in accordance with IAS 37. [IFRIC 1.2]. IFRIC 1 requires an increase that reflects the passage of time (also referred to as the unwinding of the discount) to be recognised in profit or loss as a finance cost as it occurs. [IFRIC 1.8]. The IFRS IC concluded that the unwinding of the discount is not a borrowing cost as defined in IAS 23 *Borrowing Costs*, and thus cannot be capitalised under that standard. [IFRIC 1.BC26, IFRIC 1.BC27].

For a change in either: (a) the estimated outflow of resources embodying economic benefits (e.g., cash flows) required to settle the obligation; or (b) change in the current market-based discount rate (this includes changes in the time value of money and the risks specific to the liability) the adjustment is taken to the income statement only in specific circumstances. Any revision to the provision (other than to reflect the passage of time) is first recognised in the carrying value of the related asset or in other comprehensive income, depending on whether the asset is measured at cost or using the revaluation model. [IFRIC 1.4, IFRIC 1.5, IFRIC 1.6, IFRIC 1.7].

If the related asset is measured using the cost model, the change in the liability is added to or deducted from the cost of the asset to which it relates. Where the change gives rise to an addition to cost, the entity must consider the need to test the new carrying value for impairment. This is particularly relevant for assets approaching the end of their useful life, as their remaining economic benefits are often small compared to the potential changes in the related decommissioning liability. Reductions over and above the remaining carrying value of the asset are recognised immediately in profit or loss. [IFRIC 1.5]. The adjusted depreciable amount of the asset is then depreciated prospectively over its remaining useful life. [IFRIC 1.7].

If the related asset is measured using the revaluation model, changes in the liability alter the revaluation surplus or deficit previously recognised for that asset. Decreases in the provision are recognised in other comprehensive income and increase the value of the revaluation surplus in respect of the asset, except that:

- A decrease in the provision is required to be recognised in profit or loss to the extent that it reverses a previous revaluation deficit on that asset that was recognised in profit or loss.
- If a decrease in the provision exceeds the carrying amount of the asset that would have been recognised under the cost model, the excess is required to be recognised in profit or loss. [IFRIC 1.6].

Increases in the provision are recognised in profit or loss, except that they must be recognised in other comprehensive income, and reduce the revaluation surplus, to the extent of any credit balance existing in the revaluation surplus in respect of that asset. Changes in the provision might also indicate the need for the asset (and therefore all assets in the same class) to be revalued. [IFRIC 1.6].

Some entities may participate in a decommissioning, restoration or environmental rehabilitation fund, the purpose of which is to segregate assets to fund some, or all, of the costs of decommissioning for which the entity must make a provision under Section 21. There is no specific guidance on such funds within FRS 102. Under IFRS, IFRIC 5 *Rights to Interests arising from Decommissioning, Restoration and Environmental Rehabilitation Funds* was issued to address the accounting for these funds, referring to decommissioning to mean not only the dismantling of plant and equipment but also the costs of undertaking environmental rehabilitation, such as rectifying pollution of water or restoring mined land. [IFRIC 5.1].

IFRIC 1 and IFRIC 5 are discussed further in the EY publication, International GAAP®. Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, IFRIC 1 and IFRIC 5 may be relevant for an FRS 102 reporter to consider in developing an accounting policy for decommissioning provisions and related funds under the hierarchy in Section 10 (see Chapter 9 at 3.1).

3.11.2 Environmental provisions

IAS 37 sets out two examples of circumstances where environmental provisions would be required, both in relation to contaminated land. The examples illustrate that an entity can have an obligation to clean up contaminated land either as a result of legislation or as a result of a widely publicised environmental policy. The accounting applied in these examples is consistent with the principles of Section 21.

The first example deals with the situation where it is virtually certain that legislation will be enacted which will require the clean-up of land already contaminated. In these circumstances, the virtual certainty of new legislation being enacted means that the entity has a present legal obligation as a result of the past event (contamination of the land), requiring a provision to be recognised. [IAS 37.IE Example 2A]. Although Section 21 does not contain equivalent guidance on virtual enactment of legislation (see 3.2.1 above), given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, this example may be relevant for an FRS 102 reporter to consider in developing an accounting policy for proposed new laws yet to be finalised.

The second example deals with a similar situation, except that the entity is not expected to be legally required to clean it up. Nevertheless, the entity has a widely publicised environmental policy undertaking to clean up all contamination that it causes and has a record of honouring this policy. In these circumstances, a provision is still required because the entity has created a valid expectation that it will clean up the land, meaning that the entity has a present constructive obligation as a result of past contamination.

[IAS 37.IE Example 2B].

It is therefore clear that where an entity causes environmental damage and has a present legal or constructive obligation to make it good; it is probable that an outflow of resources will be required to settle the obligation; and a reliable estimate can be made of the amount, a provision will be required. [IAS 37.14] [FRS 102.21.4].

3.11.3 Liabilities associated with emissions trading schemes

A number of countries around the world either have, or are developing, schemes to encourage reduced emissions of pollutants, in particular greenhouse gases. Schemes commonly involve a 'cap and trade' model whereby participants are allocated emission rights or allowances equal to a cap (i.e., a maximum level of allowable emissions) and are permitted to trade those allowances.

In 'cap and trade' schemes every tonne of emissions made creates an obligation. In such schemes, allowances received from the government represent economic resources of the entity (because they can be used for an alternative purpose, for example, sale to a third party) and, therefore, as the entity emits greenhouse gases it is probable there will be an outflow of economic resources (i.e., the allowances) to settle the obligation. In this situation, a liability is recognised as the entity emits, from the first tonne.

Neither Section 21 nor IFRS provide any specific requirements for 'cap and trade' schemes. In practice, three approaches have gained acceptance for accounting for 'cap and trade' emission schemes under IFRS:

- The IFRIC 3 *Emission Rights* approach, which despite having been withdrawn, is considered to be an appropriate interpretation of existing IFRS. This approach leads to the recognition of an asset for the credits or allowances; a government grant; and a liability in respect of emissions. However, this approach can result in accounting mismatches because the liability for the obligation to deliver allowances is measured at the current market price.

- The net liability approach where, in practice, two approaches have gained acceptance:
 - The 'net liability/carrying value' approach - under this approach, the allowances (or emission rights) received by way of a grant are recorded at a nominal amount (in most cases, nil) and purchased rights are initially recognised at cost. The liability component is measured at the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held (both granted and purchased). The measurement of the emissions liability can be estimated on a FIFO or on a weighted average basis. Using FIFO basis, an entity measures the liability taking into account the allowances held at the end of the (interim or annual) reporting period first, and then includes the expected cost per unit, using the current market price, for the actual shortfall at the end of the reporting period. Using a weighted average basis, an entity measures the liability by calculating the weighted average cost per unit of expected emissions over the entire compliance period (i.e., including the estimated shortfall).
 - The 'net liability/reimbursement rights' approach - under this approach, the allowances (or emission rights) received by way of a grant are recorded initially at a nominal amount (in most cases, nil) and purchased rights are initially recognised at cost, but the entity remeasures (to fair value) the emission rights (or allowances) that it holds and can use to settle the liability up the amount of emission made in the period. The liability component is measured at the best estimate of the cost to settle the liability taking into account the cost of any allowances currently held (and remeasured to fair value).
- The government grant approach leads to the recognition of an asset for the credits or allowances; a government grant; and a liability in respect of emissions. Therefore, it is similar to the IFRIC 3 approach, except that the liability is measured by reference to the carrying value of the credits or allowances to the extent they will be used to settle the liability.

FRS 102 reporters will need to develop their own accounting policy, in accordance with Section 10 (see Chapter 9 at 3.1).

3.11.4 EU Directive on Waste Electrical and Electronic Equipment

This Directive regulates the collection, treatment, recovery and environmentally sound disposal of waste electrical or electronic equipment (WE&EE). It applies to entities involved in the manufacture and resale of electrical or electronic equipment, including entities (both European and Non-European) that import such equipment into the EU.

The Directive states that the cost of waste management for historical household equipment must be borne by producers of that type of equipment that are in the market during a period to be specified in the applicable legislation of each Member State (the measurement period). The Directive states that each Member State must establish a mechanism to have producers contribute to costs proportionately e.g., in proportion to their respective share of the market by type of equipment.

IFRIC 6 *Liabilities arising from Participating in a Specific Market - Waste Electrical and Electronic Equipment* clarifies that the obligation under the Directive is linked to participation in the market during the measurement period, with there being no obligation unless and until a market share exists during the measurement period. The obligation is not linked to the production or sale of the items to be disposed of. Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, it would be appropriate to consider the guidance in IFRIC 6 in developing an accounting policy for the identification of an obligation arising from the Directive under FRS 102, in accordance with the hierarchy in Section 10 (see Chapter 9 at 3.1).

3.11.5 Levies charged on entities operating in a specific market

When governments or other public authorities impose levies on entities in relation to their activities, it is not always clear when the liability to pay a levy arises and when a provision is recognised.

Under IFRS, IFRIC 21 *Levies* addresses this question. It requires that, for levies within its scope, an entity must recognise a liability only when the activity that triggers payment, as identified by the relevant legislation, occurs. [IFRIC 21.8].

IFRIC 21 defines a levy as "...an outflow of resources embodying economic benefits that is imposed by governments on entities in accordance with legislation (i.e., laws and/or regulations), other than:

- (a) those outflows of resources that are within the scope of other Standards (such as income taxes that are within the scope of IAS 12 *Income Taxes*); and
- (b) fines or other penalties that are imposed for breaches of the legislation.

'Government' refers to government, government agencies and similar bodies whether local, national or international." [IFRIC 21.4].

In addition to income taxes and fines, IFRIC 21 does not apply to contractual arrangements with government in which the entity acquires an asset or receives services. [IFRIC21.4, IFRIC 21.5].

For levies within the scope of IFRIC 21, the activity that creates the obligation under the relevant legislation to pay the levy is the obligating event for recognition purposes. [IFRIC 21.8]. In many cases this activity is related to the entity's participation in a relevant market at a specific date or dates. The Interpretation states that neither a constructive nor a present obligation arises as a result of being economically compelled to continue operating; or from any implication of continuing operations in the future arising from the use of the going concern assumption in the preparation of financial statements. [IFRIC 21.9, IFRIC 21.10].

When a levy is payable progressively, for example, as the entity generates revenues, the entity recognises a liability over a period of time on that basis. This is because the obligating event is the activity that generates revenues. [IFRIC 21.11]. If an obligation to pay a levy is triggered in full as soon as a minimum threshold is reached, such as when the entity commences generating sales or achieves a certain level of revenue, the liability is recognised in full on the first day that the entity reaches that threshold. [IFRIC 21.12]. If an entity pays over amounts to government before it is determined that an obligation to pay that levy exists, it recognises an asset. [IFRIC 21.14].

The table below summarises the illustrative examples that accompany IFRIC 21, which provide guidelines on how to account for the timing of the recognition for the various types of levies: [IFRIC 21.IE1]

Illustrative examples	Obligating event	Recognition of liability
Levy triggered progressively as revenue is generated in a specified period.	Generation of revenue in the specified period.	Recognise progressively. A liability must be recognised progressively because, at any point in time during the specified period, the entity has a present obligation to pay a levy on revenues generated to date.
Levy triggered in full as soon as revenue is generated in one period, based on revenues from a previous period.	First generation of revenue in subsequent period.	Full recognition at that point in time. Where an entity generates revenue in one period, which serves as the basis for measuring the amount of the levy, the entity does not become liable for the levy, and therefore cannot recognise a liability, until it first starts generating revenue in the subsequent period.
Levy triggered in full if the entity operates as a bank at the end of the annual reporting period.	Operating as a bank at the end of the reporting period.	Full recognition at the end of the annual reporting period. Before the end of the annual reporting period, the entity has no present obligation to pay a levy, even if it is economically compelled to continue operating as a bank in the future. The liability is recognised only at the end of the annual reporting period.
Levy triggered if revenues are above a minimum specified threshold (e.g., when a certain level of revenue has been achieved)	Reaching the specified minimum threshold.	Recognise an amount consistent with the obligation at that point of time. A liability is recognised only at the point that the specified minimum threshold is reached. For example, a levy is triggered when an entity generates revenues above specified thresholds: 0% for the first CU50 million and 2% above CU50 million. In this example, no liability is accrued until the entity's revenues reach the revenue threshold of CU50 million.

We discuss the accounting for two levies that may be relevant to entities in the UK, the Bank of England Levy and the Apprenticeship Levy, at 3.11.5.A and 3.11.5.B below.

IFRIC 21 does not address the accounting for the costs that arise from recognising a liability to pay a levy. It requires entities to apply other IFRS accounting standards to decide whether the recognition of a liability to pay a levy gives rise to an asset or an expense. [IFRIC 21.3].

Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, it would be appropriate to consider the guidance in IFRIC 21 in developing an accounting policy for the recognition of liabilities for levies under FRS 102, in accordance with the hierarchy in Section 10 (see Chapter 9 at 3.1). IFRIC 21 is discussed further in the EY publication, International GAAP®.

3.11.5.A UK Bank of England Levy

The UK Bank of England Levy is levied by the Bank of England on 'Eligible Institutions' to fund the costs of the Bank's monetary policy and financial stability operations. An Eligible Institution is defined in the Bank of England 1998 Act as an institution who, at any time during a Levy Year, is an authorised deposit taker under the Financial Services and Markets Act 2000.¹¹³

The Levy is charged to Eligible Institutions that have eligible liabilities greater than £600 million average in the period from 1st October to 31st December prior to the start of the Levy Year ('the Reference Period'). The Levy Year is the 12-month period beginning on 1st March in one calendar year to the last day of February in the following calendar year.

The Levy is charged annually for the year ahead, based on the Bank's projection for its annual policy costs and subject to any adjustments. In June of each year, the Bank publishes the total amount of the Levy for the current Levy Year, and any true up in respect of the previous Levy Year. An invoice for the Levy Year is issued to Eligible Institutions in July each year, reflecting the Levy amount payable by that entity for the current Levy Year, and any true-up for the previous Levy Year. The amount of levy payable by each payer is proportionate to the average size of the eligible liabilities in their deposit book during the Reference Period. Ceasing to be an Eligible Institution during a Levy Year does not discharge an entity from the obligation to pay the Levy in full for that year.

The diagram below shows an example of reference periods and other relevant dates within a Levy year.

¹¹³ The Financial Services and Markets Act 2000, Section 359(4) defines an authorised deposit taker as a person with a permission to accept deposits (but not a person who has a permission to accept deposits only for the purpose of carrying on another regulated activity in accordance with that permission).

For simplicity, the discussion below refers only to the liability in respect of each annual Levy Year, and not for any true-up adjustments in respect of the previous Levy Year.

As discussed above, IFRIC 21 provides specific guidance on accounting for levies under IFRS. Whilst there is no equivalent guidance in Section 21, entities may wish to apply it to the recognition of liabilities for levies under FRS 102, since Section 21 is consistent with the principles of IAS 37.

In considering when a levy is recognised, IFRIC 21 states “The obligating event that gives rise to a liability to pay a levy is the activity that triggers the payment of the levy, as identified by the legislation.” [IFRIC 21.8].

Based on the relevant Legislation,¹¹⁴ for an entity that is an Eligible Institution, there two conditions that trigger payment of the levy:

- The institution needs to meet the threshold of having an average amount of eligible liabilities of at least £600 million during a Reference Period, being 1st October to 31st December of the calendar year prior to a Levy Year (the 12-month period beginning on 1st March in one calendar year and ending on the last day of February in the following calendar year).

And

- The institution needs to be an authorised deposit taker at any time during the Levy Year.

The first condition could be met during the Reference Period (i.e., as soon as the average deposits meet £600 million). However, the second condition could be met only during the current Levy Year. Therefore, we believe that the obligating event that gives rise to a liability to pay a levy does not occur before 1st March. Assuming the first condition is met, an Eligible Institution will become liable to pay the levy on the first day of any given Levy Year that it is an authorised deposit-taker, typically on 1st March.

In addition, as noted above, ceasing to be an Eligible Institution during a Levy Year does not discharge an entity from the obligation to pay the levy in full for that year. Therefore, we believe that full liability for the Levy Year ending on the last day of February in the following calendar year would be recognised at the point the obligating event occurs, typically at the start of the Levy Year (1st March). As the total amount of the levy for the current Levy Year is not published until June of each year, and is invoiced to Eligible Institutions in July each year, entities recognising a liability at the start of the Levy Year will typically have to estimate the amount of the levy for that Levy Year, including the impact of any true-ups.

How we see it

In our view, the activity that triggers the payment for the levy in respect of a Levy Year would typically be met on the 1st March (i.e., at the start of the Levy Year) of any given year. The amount recognised on this date would be the full liability for the Levy Year.

3.11.5.B UK Apprenticeship levy

Since 6 April 2017, UK employers with an annual pay bill in excess of £3 million are required to pay a levy of 0.5% of that bill. Payments are made via the PAYE system, along with payroll taxes. Amounts paid by the employer are recorded in the employer’s account on the government controlled ‘Digital Apprenticeship System’ (DAS). Payments made under the levy are credited to the employer’s DAS account and are immediately available to fund certain approved apprenticeship training for, or assessment of, new hires or existing employees. Payments to the training provider are made directly by the government, with a corresponding reduction made to the employer’s DAS balance. The employer cannot recover cash directly from the DAS account, and amounts paid into the DAS expire after 24 months, i.e., they cannot be applied against training costs incurred after that time.

Government also contributes to apprenticeship costs, through a ‘top-up’ of £1 for every £10 paid in through the levy system, and through, in some cases, co-investment funding.

As discussed above, IFRIC 21 provides specific guidance on accounting for levies under IFRS. Whilst there is no equivalent guidance in Section 21, entities may wish to apply it to the recognition of liabilities for levies under FRS 102, since Section 21 is consistent with the principles of IAS 37. However, whilst IFRIC 21 addresses the recognition of liabilities to pay levies, entities are required to apply other Standards to decide whether recognition of a liability to pay a levy gives rise to an asset or expense. [IFRIC 21.3].

¹¹⁴ Bank of England Framework Document (paragraph 1.29), and the Bank of England Act (Schedule 2ZA)

How we see it

In our view, for employers that expect to enter into apprenticeships that meet the requirements for utilisation of funds in their DAS account within the 24-month life of those funds, the payment under the levy represents a prepayment for approved training services expected to be received and must be recognised an asset until the approved training occurs. An expense will be recognised when the training is delivered. Employers that do not expect to incur qualifying training costs before their entitlement to the funds expire must recognise the payment of the levy as an expense.

Both the government 'top-up' element of funding, and any benefit received under co-investment funding would meet the definition of government grants within FRS 102 and are therefore accounted for in accordance with Section 24 *Government Grants* (see Chapter 26).

3.11.6 Repairs and maintenance of owned assets

IAS 37 includes an example, reproduced in Illustration 3-15 below, within the appendices illustrating how the principles for the recognition of a provision are applied strictly in the case of an obligation to incur repairs and maintenance costs in the future on owned assets. This is the case even when this expenditure is substantial, distinct from what may be regarded as routine maintenance and essential to the continuing operations of the entity, such as major refit or refurbishment of the asset.

Repairs and maintenance provisions for owned assets are generally prohibited under IAS 37. Given that Section 21 and IAS 37 apply the same principles to the recognition and measurement of provisions, we would also not expect provisions for repairs and maintenance of owned assets to be recognised under FRS 102.

Entities might argue that a repairs and maintenance provision should be recognised due to a clear intention to incur the expenditure at a specified time, making it likely that an outflow of resources will occur by the end of the reporting period. However, a liability is only recognised when an entity has an obligation at the reporting date resulting from past event. Therefore, an entity's intentions do not create an obligation, and no liability is recognised. Paragraph 6 of Section 21 explains that obligations that will arise from an entity's future actions (i.e., the future conduct of its business) do not give rise to an obligation at the reporting date as a result of a past event, no matter how likely they are to occur. [FRS 102.21.6].

Illustration 3-15: Prohibition on maintenance provisions relating to owned assets

Scenario 1: Re-lining costs of a furnace

An entity operates a furnace, the lining of which needs to be replaced every five years for technical reasons. At the end of the reporting period, the lining has been in use for three years. In these circumstances, a provision for the cost of replacing the lining is not recognised because, at the end of the reporting period, no obligation to replace the lining exists independently of the entity's future actions. Even the intention to incur the expenditure depends upon the entity deciding to continue operating the furnace or to replace the lining. Instead of a provision being recognised, the initial cost of the lining is treated as a significant part of the furnace asset and depreciated over a period of five years. The re-lining costs are then capitalised when incurred and depreciated over the next five years.

[IAS 37.IE Example 11A, FRS 102.17.16].

Scenario 2: Overhaul costs of an aircraft

An airline is required by law to overhaul its aircraft once every three years. Even with the legal requirement to perform the overhaul, there is no obligating event until the three-year period has elapsed. As with Scenario 1, no obligation exists independently of the entity's future actions. The entity could avoid the cost of the overhaul by selling the aircraft before the three-year period has elapsed. Instead of a provision being recognised, the overhaul cost is identified as a separate part of the aircraft asset under IAS 16 and is depreciated over three years. [IAS 37.IE Example 11B, FRS 102.17.16].

In the Illustration above, recognition of a provision was not appropriate because the entity could do all manner of things to avoid the obligation, including selling the asset, however unlikely that might be in the context of the entity's business or in terms of the relative cost of replacement as compared to repair.

The effect of the IAS 37 prohibition on setting up provisions for repairs obviously has an impact on presentation in the statement of financial position. It may not always, however, have as much impact on the statement of comprehensive income. This is because it is stated in the Illustration above that depreciation would be adjusted to take account of the repairs. For example, in the case of the furnace lining, the lining is depreciated over five years in advance of its expected repair. Similarly, in the case of the aircraft overhaul, the example in the standard states that an amount equivalent to the expected maintenance costs is depreciated over three years. The result of this is that the depreciation charge recognised in profit or loss over the life of the component of the asset requiring regular repair may be equivalent to what would previously have arisen from the combination of depreciation and a provision for repair. This is the way Section 17 requires entities to account for significant parts of an item of property, plant and equipment which have different useful lives. [FRS 102.17.16].

3.11.7 Dilapidations and other provisions relating to leased assets

Whilst it is not generally appropriate to recognise provisions that relate to repairs and maintenance of owned assets, the position can be different in the case of obligations relating to assets held under leases.

Leases often contain clauses which specify that the lessee must incur periodic charges for maintenance, make good dilapidations or other damage occurring during the rental period or return the asset to the configuration that existed as at inception of the lease. These contractual provisions may restrict the entity's ability to change its future conduct to avoid the expenditure. For example, the entity might not be able to transfer the asset in its existing condition. Alternatively, the entity could return the asset to avoid the risk of incurring costs relating to any future damage, but would have to make a payment in relation of dilapidations incurred to date. The contractual obligations in a lease could therefore create an environment in which a present obligation could exist as at the reporting date from which the entity cannot realistically withdraw.

Any provision must reflect only the conditions as at the reporting date. [FRS 102.21.4]. This means that a provision for specific damage done to the leased asset would merit recognition, as the event giving rise to the obligation under the lease has certainly occurred. For example, if an entity has erected partitioning or internal walls in a leasehold property and under the lease these must be removed at the end of the term, then provision is made for this cost (on a discounted basis, if material) at the time of putting up the partitioning or the walls. In this case, an equivalent asset would be recognised and depreciated over the term of the lease. [FRS 102.17.10].

How we see it

Leases often contain clauses which specify that the lessee is required to make good dilapidations or other damage occurring during the rental period or return the asset to the configuration that existed as at inception of the lease. However, there must be specific evidence of dilapidation before any provision can be made. It cannot be assumed that the condition of a leased asset has deteriorated simply because time has passed.

The fact that a provision for repairs can be made at all for leased assets might appear inconsistent with the case where the asset is owned by the entity. In that case, as discussed in 3.11.6 above, no provision for repairs could be made. There is, however, a difference between the two situations. Where the entity owns the asset, it has the choice of selling it rather than repairing it, and so the obligation is not independent of the entity's future actions. However, in the case of an entity leasing the asset, it can have a contractual obligation to repair any damage from which it cannot walk away.

3.11.8 Self-insurance

Another situation where entities sometimes make provisions is self-insurance which arises when an entity decides not to take out external insurance in respect of a certain category of risk because it would be uneconomic to do so. The same position may arise when a group insures its risks with a captive insurance subsidiary, the effects of which have to be eliminated on consolidation. In fact, the term 'self-insurance' is potentially misleading, since it really means that the entity is not insured at all and will settle claims from third parties from its own resources in the event that it is found to be liable. Accordingly, the recognition criteria in Section 21 must be applied, with a provision being justified only if there is a present obligation as a result of a past event; if it is probable that an outflow of resources will occur; and a reliable estimate can be determined. [FRS 102.21.4]. FRS 103 also clarifies that self-insurance is not insurance as there is no insurance contract because there is no agreement with another party. [FRS 103.A2.19(c)].

Therefore, losses are recognised based on their actual incidence and any provisions that appear in the balance sheet must reflect only the amounts expected to be paid in respect of those incidents that have occurred by the end of the reporting period.

In certain circumstances, a provision will often be needed not simply for known incidents, but also for those which insurance companies call IBNR - Incurred But Not Reported - representing an estimate of claims that have occurred at the end of the reporting period, but which have not yet been notified to the reporting entity.

How we see it

In our view, this approach is less likely to be appropriate when assessing a small number of distinct claims but could be needed when estimating the amount of a provision for a larger population of claims with common characteristics. We believe that it is appropriate that provision for such expected claims is made to the extent that such items can be measured reliably.

3.11.9 Parent company guarantees given in connection with audit exemption

The Companies Act 2006 exempts some subsidiary companies from the requirement to be audited, subject to a number of conditions. One of the conditions requires that the parent company files with the registrar a statutory guarantee of all of the outstanding financial liabilities of the subsidiary at the end of the financial year for which the subsidiary seeks an exemption from audit. [s394A, s479A].

How we see it

In our view, the statutory guarantee is not a contract. It therefore does not meet the definition of a financial guarantee contract within FRS 102 and must be accounted for under Section 21.

If it is only a remote possibility that the guarantee will be called upon by the subsidiary's creditors, the parent does not recognise a provision nor disclose the guarantee in their separate financial statement. If it is possible (but not probable) that the guarantee will be called upon, the parent must disclose a contingent liability in their separate financial statements. If it is probable that the guarantee will be called upon, the parent must recognise a provision for the best estimate of the amount required to settle the obligation under the guarantee at the reporting date.

3.11.10 Net zero commitments and liabilities

In recent years, many entities have declared that they intend to reduce and/or offset their greenhouse gas emissions with the aim of achieving net zero emissions. The financial reporting consequences of such net zero commitments will vary depending on the nature of the declarations. In some cases, an entity may declare an intention to be net zero by a certain date without committing itself to any particular actions. In other cases, entities may declare an intention to be net zero by a certain date and commit to certain actions to support that intention. Entities will need to assess whether they have a legal or constructive obligation that requires recognition of a provision.

In many cases, it may be difficult to conclude that there is a legal or constructive obligation that requires recognition of a provision. Net zero declarations often represent declarations of intentions to be met over the long term, such as by 2050, and could be changed over the course of time, for example, as a result of developments in technology related to carbon emissions. The long-term nature of such commitments may mean that an entity can still realistically withdraw from the commitment, and a declaration of intention may not raise a valid expectation in other parties regarding the entity's future actions. [FRS 102.21.6].

In addition, some actions committed to be taken towards achieving net zero may be within the scope of other Sections of FRS 102, rather than Section 21. For example, a contractual commitment to purchase low-emission plant and equipment would usually be in scope of Section 17 rather than Section 21 and would require disclosure. [FRS 102.17.32(b)]. Executory contracts, such as contractual commitments for the acquisition of plant and equipment, are within the scope of Section 21 only if they are onerous. [FRS 102.21.1B].

Under Section 21, obligations that will arise from an entity's future actions cannot be recognised as a provision. [FRS 102.21.6]. A legal requirement or public commitment to offset future greenhouse gas emissions does not, in itself, give rise to a present obligation requiring recognition of a provision. Instead, an entity could have a present obligation for the costs of offsetting emissions only when it has emitted the gas it is required, or has promised, to offset.

It is worth noting that, determining whether an entity has created a valid expectation will depend on the facts of the commitment and the circumstances surrounding it. Therefore, management needs to apply judgement to reach a conclusion. If those facts or circumstances change over time, the conclusion could do so as well. Factors that may be relevant for management to consider in their analysis include:

- The language is used in the statement. If statements describe the actions the entity 'will take', 'is committed to taking' or 'pledges to take', they are more likely to indicate that the entity will fulfil the commitment than statements that describe the entity's 'ambitions', 'targets' or 'aspirations'.
- The specificity and status of plans supporting the statement. Statements are more likely to raise a valid expectation that the entity will achieve its target to reduce its greenhouse gas emissions if they are supported by formally approved plans detailing, for example:
 - The nature and timing of the actions the entity will take to achieve the reductions.
 - Milestones the entity has committed to achieve on the path to longer term goals.
 - How management will measure progress towards the milestones and longer-term goals (for example, the metrics an entity will use).
- The expected timing of the actions required to fulfil the commitment. Plans for short- and medium-term actions are less likely to be changed than those for longer-term actions.
- Whether there is publicly available evidence of progress to date. Evidence that the entity has achieved milestones it committed to in previous statements may enhance expectations that it will achieve milestones and longer-term goals it commits to in its current statement. Conversely, evidence that an entity has failed to achieve previous milestones may reduce those expectations.

If the entity's statement has not created a constructive obligation, the entity does not recognise a provision. If the entity's statement has created a constructive obligation, consideration must then be given to whether that obligation satisfies the criteria for recognising a provision. Section 21 requires an entity to recognise a provision when the following criteria are met:

- The entity has a present obligation (legal or constructive) as a result of a past event.
- It is probable that an outflow of resources embodying economic benefits will be required to settle the obligation.

And

- A reliable estimate can be made of the obligation. *[FRS 102.21.4]*.

With regards to first criterion, the publication of a policy or statement is not sufficient to give an entity a present constructive obligation. An entity has a present legal or constructive obligation only when the event to which the law, policy or statement applies has occurred.

When an entity publishes a climate-related (net-zero) commitment that requires future action (e.g., modifying its manufacturing methods, purchasing and retiring carbon credits in the future), the related costs need to be incurred to operate in the future. The obligations to incur those costs do not exist independently of the entity's future actions. Accordingly, there is no present obligation for those costs when the entity publishes its commitment. *[FRS 102.21.6]*. An entity will have a present obligation for the modifications to its manufacturing methods once it must pay for resources it purchases to modify its methods - for example, to pay for new plant or equipment or for renewable energy - but only when it receives those resources. Similarly, in the case of a commitment to offset greenhouse gas emissions, the entity will have a present obligation only when the entity emits the gases it has committed to offset.

In considering second criterion above, whether a constructive obligation satisfies the probable outflows criterion depends on the nature of the actions required to settle it. Even if an entity will incur expenditure to settle an obligation, it will not suffer a net outflow of resources if it receives resources of equal value in exchange for that expenditure. For example, an entity may expect to incur expenditure on low-emission plant and equipment in order to modify its manufacturing methods to meet net zero commitments. In that case, the entity will receive resources (plant and equipment) of equal value in exchange for the cash outflow, and no net outflow of resources embodying economic benefits will be required to settle the obligation.

If a provision is recognised, the corresponding amount is recognised as an expense, rather than as an asset, unless it gives rise to, or forms part of the cost of, an item that qualifies for recognition as an asset in accordance with another Section of FRS 102.

Illustration 3-16: Recognising a provision for a net zero commitment

In March 20X6, a manufacturer publicly announces its commitment to becoming 'net zero' by 20X9. It announces it will:

- Immediately start to change the way it manufactures its products with the aim of gradually reducing its greenhouse gas emissions, so they are no more than 40% of their current level by 20X9.

And

- In 20X9 and thereafter, offset the remaining emissions by paying the forestry commissions of the countries in which it manufactures to plant trees.

Present obligation as a result of a past event

The manufacturer's public announcement indicates to the public that it has accepted a responsibility to eliminate or offset its greenhouse gas emissions from 20X9 onwards. This announcement is judged to create a constructive obligation for the manufacturer if it creates a valid expectation among members of the public that it will discharge this responsibility. Whether the announcement creates such an expectation is a matter of judgement, determined by management taking into account the facts and circumstances.

An announcement that fulfils the criteria for creating a constructive obligation is not sufficient in itself to recognise a provision. A present constructive obligation arises only when the manufacturer has taken actions that will require it to transfer an economic resource - that is, when it has emitted greenhouse gases it has committed to offset. It then has an obligation to pay for the amount of tree planting required to offset the past emissions. The manufacturer's commitment to change aspects of the way in which it manufactures its goods is not an obligation to transfer an economic resource.

Conclusion - The manufacturer recognises a provision as a result of its net zero commitment:

- When it has emitted the greenhouse gases it has committed to offset.
- And
- If at that time, management judges that its announcement has given rise to a constructive obligation to meet the net zero commitments.

The manufacturer would recognise a provision for the best estimate of the amounts payable to forestry commission in respect of past emissions.

Since an entity's specific plans are key to appropriately accounting for net-zero commitments, entities will need to provide sufficient disclosure to allow users of financial statements to understand the nature of their net-zero commitments and the impact on the financial statements, together with any key estimates and critical judgements required to be disclosed. [FRS 102.8.6]. Furthermore, entities should be careful to ensure that clear language is used in describing their aspirations, targets and intended actions in response to the climate change challenge. Without clear disclosure, a reader may have difficulty understanding the extent to which the entity can realistically withdraw from a course of action described in its transition plan.

How we see it

Climate-related matters potentially have a significant impact on the recognition and measurement of provisions, and the need for disclosure of contingent liabilities. However, under Section 21, only those obligations arising from past events and the settlement of which is expected to result in an outflow from the entity of resources will result in the recognition of a provision.

Given the significant uncertainties involved in assessing the extent and impact of climate change, entities need to ensure that sufficient information is disclosed to allow users of financial statements to understand those uncertainties, how planned climate transition has been taken into account in the measurement of a provision or disclosure of a contingent liability, and the assumptions and judgements made by management in recognising and measuring provisions.

4. Presentation and disclosure

For UK companies and LLPs preparing financial statements using statutory formats rather than 'adapted formats' as allowed by Section B of Part 1 of Schedule 1 to the Regulations (and Section B of Part 1 of Schedule 1 to the LLP Regulations), provisions within the scope of Section 21 would fall within the statutory caption 'Other provisions' within the heading 'Provisions for liabilities'. 'Other provisions' can be shown either on the face of the balance sheet or in the notes to the accounts. See Chapter 6 at 4.3.11.

Companies and LLPs using 'adapted formats' must present current and non-current provisions separately on the face of the balance sheet. [FRS 102.4.2A, FRS 102.4.2D]. See Chapter 6 at 4.1.10.

4.1 Disclosures about provisions

Extract from Section 21

21.14 For each class of provision, an entity shall disclose the following:

- (a) a reconciliation showing:
 - (i) the carrying amount at the beginning and end of the period;
 - (ii) additions during the period, including adjustments that result from changes in measuring the discounted amount;
 - (iii) amounts charged against the provision during the period; and
 - (iv) unused amounts reversed during the period;
- (b) a brief description of the nature of the obligation and the expected amount and timing of any resulting payments;
- (c) an indication of the uncertainties about the amount or timing of those outflows; and
- (d) the amount of any expected reimbursement, stating the amount of any asset that has been recognised for that expected reimbursement.

Comparative information for prior periods is not required. [FRS 102.21.14]

Disclosure (b) above requires disclosure of the expected amount and timing of any resulting payments. In many cases, the expected amount of the payments will be the same as the carrying amount of the provision at the end of the period. However, where a provision has been discounted to its present value it is unclear from Section 21 whether the disclosure of the expected amount of payments is expressed based on current prices or expected future prices.

Comparative information is not required for any of the disclosures about provisions. [FRS 102.21.14].

Where a transfer has been made to any provision for liabilities, or from any provision for liabilities other than for the purpose for which the provision was established, UK Company Law (i.e., the Regulations) and the LLP Regulations require disclosure, in tabular form, of:

- The amount of provisions at the beginning and the end of the year.
- Any amounts transferred to or from provisions during the year.

And

- The source and application of any amounts so transferred.

Particulars must be given of each provision included within the statutory heading 'other provisions' in any case where the amount of that provision is material. [1 Sch 59, 2 Sch 70, 3 Sch 77, 1 Sch 57 (LLP)].

4.2 Disclosures about contingent liabilities

Unless the possibility of any outflow of resources in settlement is remote, an entity must disclose, for each class of contingent liability at the reporting date, a brief description of the nature of the contingent liability and, when practicable:

- An estimate of its financial effect, measured in accordance with paragraphs 7 to 11 of Section 21 (see 3.8 above)
 - An indication of the uncertainties relating to the amount or timing of any outflow
- And
- The possibility of any reimbursement [FRS 102.21.15]

If it is impracticable to make one or more of these disclosures, that fact must be stated. [FRS 102.21.15]. Applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so. [FRS 102 Appendix I].

Section 21 does not define or put a numerical measure of probability on the term 'remote'.

How we see it

In our view, it is reasonable to interpret 'remote' as meaning a likelihood of an outflow of resources that is not significant (see 3.6 above).

The Regulations and LLP Regulations require disclosure of the particulars and the total amount of any financial commitments, guarantees and contingencies that are not included in the balance sheet. [1 Sch 63(2), 2 Sch 77(1), 3 Sch 81(2), 1 Sch 60(2)(LLP)]. An indication of the nature and form of any valuable security given by the entity in respect of those commitments, guarantees and contingencies must be given. [1 Sch 63(3), 2 Sch 77(2), 3 Sch 81(3), 1 Sch 60(3)(LLP)]. The total amount of those commitments concerning pensions must be separately disclosed. [1 Sch 63(4), 2 Sch 77(3), 3 Sch 81(4), 1 Sch 60(4)(LLP)]. The entity must also state separately the total amount of those commitments, guarantees and contingencies which are undertaken on behalf of, or for the benefit of:

- Any parent undertaking or fellow subsidiary undertaking of the entity
- Any subsidiary undertaking of the entity
- Or
- Any undertaking in which the entity has a participating interest [1 Sch 63(7), 2 Sch 77(6), 3 Sch 81(7), 1 Sch 60(7)(LLP)]

4.3 Disclosures about contingent assets

If an inflow of economic benefits is probable (more likely than not) but not virtually certain, an entity must disclose:

- A description of the nature of the contingent assets at the end of the reporting period
- And
- When practicable, an estimate of their financial effect, measured using the principles set out in paragraphs 7 to 11 of Section 21 (see 3.8 above)

If it is impracticable to make one or more of these disclosures, that fact must be stated. [FRS 102.21.16]. Applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so. [FRS 102 Appendix I].

4.4 Disclosure when information is seriously prejudicial

In extremely rare cases, disclosure of some or all of the information required (by the disclosure requirements at 4.1 to 4.3 above) can be expected to prejudice seriously the position of the entity in a dispute with other parties on the subject matter of the provision, contingent liability or contingent asset. In such circumstances, an entity need not disclose all of the information required (by 4.1 to 4.3 above) insofar as it relates to the dispute, but is required to disclose at least the following: [FRS 102.21.17]

In relation to provisions:

- A table showing the reconciliation required by 4.1 above in aggregate, including the source and application of any amounts transferred to or from provisions during the reporting period.
- Particulars of each provision in any case where the amount of the provision is material.
- And
- The fact that, and reason why, the information required by 4.1 above has not been disclosed.

In relation to contingent liabilities:

- Particulars and the total amount of contingent liabilities (excluding those which arise out of insurance contracts) that are not included in the statement of financial position.

- The total amount of contingent liabilities which are undertaken on behalf of or for the benefit of:
 - Any parent or fellow subsidiary of the entity
 - Any subsidiary of the entity
 - Any entity in which the reporting entity has a participating interest
 Shall each be stated separately.
- The fact that, and reason why, the information required by paragraph 15 of Section 21 (see 4.2 above) has not been disclosed.

In relation to contingent assets, the entity is required to disclose the general nature of the dispute, together with the fact that, and reason why, the information required by 4.3 above has not been disclosed.

[FRS 102.21.17].

4.5 Disclosures about financial guarantee contracts

An entity must disclose the nature and business purpose of any financial guarantee contracts it has issued. *[FRS 102.21.17A]*. This appears to be required regardless of whether the financial guarantee contract meets the recognition criteria for provisions or the disclosure criteria for contingent liabilities discussed at 3.2 and 3.4 above. In addition, if applicable, the disclosures required for provisions (see 4.1 above), or contingent liabilities (see 4.2 above) must also be provided. *[FRS 102.21.17A]*.

The Regulations and LLP Regulations also require disclosure of the particulars of any financial commitments that have not been provided for and are relevant to assessing the entity's state of affairs.

[1 Sch 63(2), 2 Sch 77(1), 3 Sch 81(2), 1 Sch 60(2)(LLP)].

4.6 Disclosures about funding commitments (other than loan commitments)

An entity that has made a funding commitment (see 3.10 above) is required to disclose the following:

- The commitment made
- The timeframe of that commitment
- Any performance-related conditions attached to that commitment
- Details of how that commitment will be funded *[FRS 102.34.62]*

Separate disclosure is required for recognised and unrecognised commitments. Within each category, disclosure can be aggregated provided that such aggregation does not obscure significant information. *[FRS 102.34.63]*. Accordingly, material commitments are disclosed separately.

- For funding commitments that are not recognised, it is important that full and informative disclosures are made of their existence and of the sources of funding for these unrecognised commitments. *[FRS 102.34A.6]*.

5 Summary of GAAP differences

	FRS 102	IFRS
Scope - Provisions, contingent liabilities and contingent assets covered by another Section	Section 21 does not apply to provisions, contingent liabilities and contingent assets covered by another Section of FRS 102. However, where those other Sections contain no specific requirements to deal with contracts that have become onerous, Section 21 applies to those contracts.	Under IAS 37, where a provision, contingent liability or contingent asset is covered by another IFRS and that IFRS contains no specific requirements to deal with onerous contracts, there is no general requirement that IAS 37 be applied to those contracts. However, IAS 37 states that it does apply to: - Any lease that becomes onerous before the commencement date of the lease - Short-term leases and leases of low-value assets which are recognised as an expense in accordance with IFRS 16 and have become onerous - Contracts with customers that are, or have become, onerous
Scope - Financial guarantee contracts	Financial guarantee contracts are in scope of Section 21 unless: - The entity has chosen to apply IAS 39 or IFRS 9 to its financial instruments Or - The entity has elected under FRS 103 to continue the application of insurance contract accounting	In general, issuers of financial guarantee contracts must apply IAS 32, IFRS 9 and IFRS 7 to financial guarantee contracts even though they meet the definition of an insurance contract in IFRS 17, if the risk transferred is significant. However, if an entity has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts, the issuer may elect to apply either IFRS 9 or IFRS 17. This election may be made contract by contract, but the election for each contract is irrevocable. For the holder, a financial guarantee contract held that is considered to be an integral component of the guaranteed debt instrument will be accounted for as part of the ECL on that debt instrument. IFRS does not cover the accounting for the holder of a financial guarantee contract which is not considered to be integral to the underlying debt instruments. In developing a policy, entities could look to the requirements of IAS 37 dealing with contingent assets or reimbursement assets, at least as far as recoveries under the contract are concerned. In certain situations, it could also be appropriate for the holder of a financial guarantee

FRS 102		IFRS
		contract to account for it as an asset at fair value through profit or loss. This might be the case if the guaranteed asset has itself been classified as at fair value through profit or loss.
Onerous contracts - unavoidable costs	Similar definition of onerous contract to IFRS. However, Section 21 Appendix Example 2 explains, the unavoidable costs under a contract reflect the least net cost of exiting from the contract, which is the lower of the cost of fulfilling it and any compensation or penalties arising from failure to fulfil it.	IAS 37 provides guidance that the costs of fulfilling a contract comprises the costs that relate directly to the contract. This consists of the incremental costs of fulfilling that contract and an allocation of other costs that relate directly to fulfilling contracts.
Disclosure -Provisions	Included within the disclosure requirements for provisions is a requirement to disclose the expected amount of payments resulting from an obligation. There is no requirement to disclose: - Major assumptions concerning future events that may affect the amount required to settle an obligation Or - A separate line item in the reconciliation of opening and closing provision balances showing the increase during the period in the discounted amount arising from the passage of time and the effect of any change in discount rate.	Included within the disclosure requirements for provisions are requirements to disclose: - Major assumptions concerning future events that may affect the amount required to settle an obligation where this is necessary to provide adequate information - A separate line item in the reconciliation of opening and closing provision balances showing the increase during the period in the discounted amount arising from the passage of time and the effect of any change in discount rate. - There is no requirement to disclose the expected amount of payments resulting from an obligation.
Disclosure when information is seriously prejudicial	Section 21 includes much more fulsome disclosure requirements in the case where information is considered seriously prejudicial than is required under IFRS. The disclosure requirements are set out in 4.4 above and significantly reduce the usefulness of the seriously prejudicial exemption under Section 21 compared to IFRS.	Under the seriously prejudicial exemption in IAS 37, entities must disclose the general nature of the dispute, together with the fact that, and the reason why, the information otherwise required by the standard has not been disclosed.

	FRS 102	IFRS
Disclosure - Financial guarantee contracts	An entity must disclose the nature and business purpose of any financial guarantee contracts it has issued, regardless of whether a provision is required. In addition, to the extent a provision is recognised for financial guarantee contracts, or a contingent liability disclosed, the general provision/contingent liability disclosures within Section 21 are also required.	Financial guarantee contracts issued are in scope of the disclosure requirements of IFRS 7 (if the issuer has elected to apply IFRS 9 or IAS 39 to the contracts), or IFRS 17. For the holder, the financial guarantee is accounted for as part of the Expected Credit Loss where the financial guarantee contract held is considered to be an integral component of the guaranteed debt instrument.

Appendix A - Defined terms

Extract from FRS 102

Appendix I

constructive obligation	An obligation that derives from an entity's actions where: (a) by an established pattern of past practice, published policies or a sufficiently specific current statement, the entity has indicated to other parties that it will accept certain responsibilities; and (b) as a result, the entity has created a valid expectation on the part of those other parties that it will discharge those responsibilities.
contingent asset	A possible asset that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity.
contingent liability	A contingent liability is either: (a) a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity; or (b) a present obligation that arises from past events but is not recognised because: (i) it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation; or (ii) the amount of the obligation cannot be measured with sufficient reliability.
financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payments when due in accordance with the original or modified terms of a debt instrument.
liability	A present obligation of the entity to transfer an economic resource as a result of past events. ¹¹⁵
onerous contract	A contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it.
present value	A current estimate of the present discounted value of the future net cash flows in the normal course of business.
probable	More likely than not.
provision	A liability of uncertain timing or amount. For the purposes of this definition, a liability is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits.
restructuring	A restructuring is a programme that is planned and controlled by management and materially changes either: (a) the scope of a business undertaken by an entity; or (b) the manner in which that business is conducted.

¹¹⁵ For the purposes of Sections 21 and 22, a liability is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefit

Chapter 25

Revenue

Contents

Overview	1128
1 Introduction	1129
2 Comparison between Section 23 and IFRS	1131
2.1 Interactions with other sections of FRS 102 and/or other FRSs	1131
2.2 Time value of money	1131
2.3 Application of residual approach when estimating stand-alone selling prices	1131
2.4 Allocation of a discount or variable consideration	1132
2.5 Capitalisation of costs to obtain a contract	1132
2.6 Disclosures	1132
3 Requirements of Section 23	1133
3.1 Scope	1133
3.1.1 Scope of Section 23	1133
3.1.1.A Non-monetary exchanges	1134
3.1.2 Other scope considerations	1134
3.1.3 Definition of a customer	1135
3.1.4 Collaborative arrangements	1136
3.1.5 Interaction with other sections of FRS 102 or other FRSs	1136
3.1.6 Other income and other revenue	1139
3.1.6.A Income and distributable profits	1139
3.1.6.B Interest and dividends	1139
3.1.6.C Disposal of non-financial assets not in the ordinary course of business	1139
3.1.6.D Sale of assets held for rental	1140
3.2 Revenue recognition model	1140
4 Step 1 – Identify the contract with a customer	1141
4.1 Attributes of a contract	1141
4.1.1 Parties have approved the contract and are committed to perform their respective obligations	1143
4.1.2 Each party's rights regarding the goods or services to be transferred can be identified	1144
4.1.3 Payment terms can be identified	1144
4.1.4 Commercial substance	1144
4.1.5 Ability and intention to pay	1144
4.1.5.A Variable consideration versus credit risk	1145
4.1.5.B Example of assessing the collectability criterion	1146
4.2 Contract enforceability and termination clauses	1148

4.3	Combining contracts	1153
4.3.1	Portfolio approach practical expedient	1154
4.4	Contract modifications	1154
4.4.1	Contract modification represents a separate contract	1160
4.4.2	Contract modification is not a separate contract	1161
4.4.2.A	Modification is a termination of the existing contract and the creation of a new contract	1161
4.4.2.B	Modification is part of the existing contract	1162
4.4.2.C	Modification is part of the existing contract and the creation of a new contract	1163
4.5	Arrangements that do not meet the definition of a contract under Section 23	1166
5	Step 2 - Identify the performance obligations in the contract	1168
5.1	Identifying the promised goods or services in the contract	1168
5.2	Determining when promises are performance obligations	1175
5.2.1	Determination of 'distinct'	1176
5.2.1.A	Capable of being distinct	1176
5.2.1.B	Distinct within the context of the contract	1177
5.2.1.C	Distinct within the context of the contract: separately identifiable principle	1178
5.2.1.D	Distinct within the context of the contract: significant integration service	1178
5.2.1.E	Distinct within the context of the contract: significant modification or customisation	1179
5.2.1.F	Distinct within the context of the contract: highly interdependent or highly interrelated	1180
5.2.1.G	Distinct within the context of the contract: March 2018 IFRS IC discussion and frequently asked questions	1181
5.2.1.H	Distinct within the context of the contract: examples	1182
5.2.2	Series of distinct goods or services that are substantially the same and have the same pattern of transfer	1185
5.2.3	Examples of identifying performance obligations	1191
5.3	Promised goods or services that are not distinct	1191
5.4	Principal versus agent considerations	1191
5.4.1	Identifying the specified good or service	1193
5.4.2	Control of the specified good or service	1195
5.4.2.A	Principal indicators	1198
5.4.2.B	Principal indicators: primarily responsible for fulfilling the promise	1198
5.4.2.C	Principal indicators: inventory risk	1199
5.4.2.D	Principal indicators: pricing discretion	1199
5.4.2.E	Principal indicators: examples	1199
5.4.3	Recognising revenue as principal or agent	1200
5.4.4	Examples of principal versus agent considerations	1201
5.5	Consignment arrangements	1204
5.6	Customer options for additional goods or services	1205
5.7	Sale of products with a right of return	1215
6	Step 3 - Determine the transaction price	1217
6.1	Presentation of sales (and other similar) taxes	1218
6.2	Variable consideration	1219
6.2.1	Forms of variable consideration	1219

6.2.1.A	Implicit price concessions	1222
6.2.1.B	Variable consideration versus credit risk	1223
6.2.2	Estimating variable consideration	1225
6.2.3	Constraining estimates of variable consideration	1228
6.2.4	Reassessment of variable consideration	1233

Overview

Revenue is one of the most important indicators of an entity's performance. It might be perceived as an indicator of the desirability of an entity's products and services, and the growth or decline over time of a business. However, revenue does not represent all income for an entity. As discussed in Chapter 6 at 5.1.2, revenue is a subset of income, it is derived from the ordinary activities of an entity and might be referred to by a variety of different names, including sales, fees, interest, dividends, royalties and rent.

Identifying what is revenue and specifying how and when to measure and report it is critical to any accounting framework. Section 23 *Revenue from Contracts with Customers* provides accounting requirements for all revenue arising from contracts with customers to provide goods or services (unless the contracts are in the scope of other sections of FRS 102). Several other sections within FRS 102 deal with the recognition of revenue, for example, Section 20 *Leases* covers lease revenue and Section 11 *Basic Financial Instruments* and Section 12 *Other Financial Instruments Issues* cover dividends and interest, which would represent revenue, if they are part of an entity's ordinary activities (see 3.1.3 below).

This chapter primarily covers Section 23 which only involves a subset of revenue - specifically, revenue that arises from a contract when the counterparty to that contract is a customer (as defined, see 3.1.3 below) and the contract is not specifically excluded from Section 23 (e.g., lease contracts within the scope of Section 20 or financial instruments within the scope of Section 11 or Section 12, see 3.1.1 below for a complete list of scope exclusions).

Section 23 describes the principles an entity must apply to report useful information about the nature, amount, timing and uncertainty of revenue and the related cash flows. The core principle is that an entity recognises revenue at an amount that reflects the consideration to which the entity expects to be entitled in exchange for transferring goods or services to a customer.

Other revenue items that are not within the scope of Section 23 but arise in the course of the ordinary activities of an entity (see 3.1.3 below), as well as the disposal of non-financial assets that are not part of the ordinary activities of the entity, for which Section 23's requirements are relevant, are discussed in 3.1.6 below.

What you need to know

- Section 23 provides a single source of revenue requirements for all entities in all industries.
- Section 23 applies to revenue from contracts with customers, unless explicitly excluded from the scope (e.g., leasing contracts, financial instruments).
- Section 23 is principles-based and includes detailed guidance. The lack of bright lines might require the use of judgement.
- Section 23 also specifies the accounting treatment for certain items other than revenue, such as certain costs associated with obtaining and fulfilling a contract and the sale of certain non-financial assets.

1 Introduction

Section 23 provides accounting requirements for all revenue arising from contracts with customers. It applies to all entities that enter into contracts to provide goods or services to their customers, unless the contracts are in the scope of other sections of FRS 102, such as that for leases. It also specifies the accounting for costs an entity incurs to obtain and fulfil a contract to provide goods or services to customers (see 10.3 below) and provides a model for the measurement and recognition of gains and losses on the sale of certain non-financial assets, such as property, plant and equipment ('PP&E') (see 3.1.6.C below).

This chapter discusses Section 23 contained in the September 2024 version of FRS 102, which incorporates the *Amendments to FRS 102 The Financial Reporting Standard applicable in the UK and Republic of Ireland and other FRSS - Periodic Review 2024* ('Periodic Review 2024 amendments') issued by the FRC in March 2024. Generally, the Periodic Review 2024 amendments provide closer alignment between FRS 102 and IFRS Accounting Standards ('IFRS').

As part of the Periodic Review 2024 amendments, Section 23 *Revenue* in the January 2022 version of FRS 102 (the 'legacy Section 23'), which included revenue recognition requirements based on IAS 11 *Construction Contracts* and IAS 18 *Revenue*, was entirely replaced with a new Section 23 *Revenue from Contracts with Customers* ('Section 23' or the 'revised Section 23'), providing a five-step revenue recognition model based on IFRS 15 *Revenue from Contracts with Customers* (see 3.2 below).

[FRS 102.BC.B23.1]. To apply the revenue recognition model, an entity has to identify distinct goods or services promised to the customer and the amount of consideration to which the entity is entitled in exchange for the promised goods or services.

Whilst the requirements allow an entity to use an accounting policy for revenue that meets the requirements of both FRS 102 and IFRS 15 to promote efficiency within groups, Section 23 includes accounting simplifications, compared to IFRS 15, to provide proportionate and practical solutions that are cost effective to apply. These simplifications include: [FRS 102.BC.B23.9]

- Not requiring an entity to adjust for the effects of time value of money on payments received in advance (see 6.5.2.A below).
- Flexibility in allocating discounts or variable consideration to the contract (see 7 below).
- An accounting policy choice on whether an entity capitalises its costs to obtain a contract with a customer (see 10.3.1 below).

And

- Greater use of hindsight when estimating variable consideration and evaluating contract modifications when an entity applies the revised Section 23 for the first time (see 12 below) or when an entity adopts FRS 102 for the first time (see Chapter 37).

The disclosure requirements in Section 23 are based on those in *Draft third edition of IFRS for SMEs Accounting Standard*, rather than IFRS 15, to provide proportionate and practical solutions that are cost effective to apply (see 11 below). [FRS 102.BC.B23.10]. The requirement in IFRS 15 to disclose significant judgements made in applying the requirements is not included in Section 23. However, the FRC noted that Section 8 *Notes to the Financial Statements* would also apply to the judgements applied in respect of Section 23. [FRS 102.BC.B23.11].

Transitional requirements allow entities to apply the revised Section 23 retrospectively in accordance with Section 10 *Accounting Policies, Estimates and Errors*, or retrospectively with the cumulative effect of initially applying the revised section recognised in the current year. The latter approach is similar to the 'cumulative catch-up' transition method in IFRS 15, but as a proportionate simplification also allows greater scope to use hindsight when estimating variable consideration and evaluating contract modifications on transition (see 12.2.3 below). [FRS 102.BC.B23.12].

The effective date of the revised Section 23 and the detailed transitional requirements are discussed in 12 below.

As discussed above, the requirements in Section 23 are more closely aligned with the requirements in IFRS 15. Applying the GAAP hierarchy in Section 10, an entity reporting under FRS 102 could apply relevant additional guidance in IFRS 15 as the principles in Section 23 are based on, and largely consistent with, those in IFRS 15. Relevant discussions, views and decisions reached by the IFRS Interpretations Committee (IFRS IC) and the Joint Transition Resource Group for Revenue Recognition (TRG) in relation to implementation of IFRS 15 could also be considered and applied by an entity reporting under FRS 102, provided that these are based on principles in IFRS 15 that are consistent with Section 23. [FRS 102.10.6].

Accordingly, where IFRS 15 (including relevant application guidance, illustrative examples and explanation in the Basis for Conclusions for IFRS 15) provides additional guidance that is consistent with the principles in Section 23, we have considered such guidance in this chapter to explain the requirements in Section 23. Whilst agenda decisions of the IFRS IC do not directly apply to entities reporting under FRS 102, we expect agenda decisions issued in relation to the application of IFRS 15 to be relevant to entities applying Section 23 due to the close alignment of the requirements. Accordingly, we have considered IFRS IC agenda decisions in this chapter, where relevant.

Further, following the issuance of their revenue standards (i.e., IFRS 15 and ASC 606 *Revenue from Contracts with Customers*), the International Accounting Standards Board (IASB) and the US Financial Accounting Standards Board (FASB) created the TRG to address implementation issues that might arise when entities implemented the new revenue standard. Views and guidance from the TRG discussions are also considered in this chapter, where relevant to applying the related Section 23 requirements.

Whilst this chapter addresses some of the complexities in Section 23, the EY publication, International GAAP® includes more detailed guidance regarding the application of IFRS 15 that might also be relevant in the application of the requirements in Section 23, as indicated later in this chapter.

2 Comparison between Section 23 and IFRS

Section 23 contains less extensive guidance than IFRS 15 and includes certain simplifications. The key differences between Section 23 and IFRS 15 are discussed at 2.1 to 2.6 below. The table at 13 below contains a summary of the GAAP differences.

2.1 Interactions with other sections of FRS 102 and/or other FRSS

If a contract with a customer is partially within the scope of Section 23 and partially within the scope of other sections of FRS 102, Section 23 requires an entity to separate or initially measure any parts of the contract which are in the scope of the other section according to the requirements in that section. [FRS 102.23.3]. This is applicable to all contracts with a customer.

By contrast, the requirements in paragraph 7 of IFRS 15 are only applicable to contracts with customers that are listed in paragraph 5 of IFRS 15 (see 13 below for the list). That is, the scope of paragraph 7 of IFRS 15 is narrow and not applicable to all contracts with customers that might be partially within the scope of another adopted IFRS, that is not specifically listed in paragraph 5. Further, insurance contracts within the scope of IFRS 17 *Insurance Contracts* are included in that list, whereas under UK GAAP, insurance contracts are within the scope of FRS 103 *Insurance Contracts*, not within the sections of FRS 102.

See 3.1.5 below for further discussion.

2.2 Time value of money

A key difference between Section 23 and IFRS 15 relates to advance payments received from customers. Section 23 does not require (but offers a policy choice) to adjust the promised amount of consideration for the effects of the time value of money and recognise the resulting interest expense. [FRS 102.23.59]. See further discussion in 6.5.2 below. However, under IFRS 15, there is no such policy choice or exemption from accounting for the effects of a significant financing component arising from advance payments. [IFRS 15.60].

IFRS 15 includes examples of several situations which do not provide the customer or the entity with a significant benefit of financing, and therefore, no adjustment for financing component is required. [IFRS 15.62]. However, Section 23 does not provide similar guidance.

2.3 Application of residual approach when estimating stand-alone selling prices

In allocating the transaction price to each performance obligation on a relative stand-alone selling price, an entity is required to estimate the stand-alone selling price of a good or service if such a price is not directly observable. The residual approach is one of three examples of potential estimation approaches an entity can use, but only if the stand-alone selling price of a good or service is highly variable or uncertain.

Under Section 23, in applying the residual approach, an entity could estimate the stand-alone selling price by reference to the total transaction price less the sum of the observable or estimated stand-alone selling prices of other goods or services promised in the contract. [FRS 102.23.70(c)]. See 7.1.2 below for further discussion.

Under IFRS 15, application of the residual approach allows an entity to estimate the stand-alone selling price of a promised good or service as the difference between the total transaction price and the observable (i.e., not estimated) stand-alone selling prices of other promised goods or services in the contract. [IFRS 15.79(c)]. Accordingly, in addition to meeting one of the two criteria (i.e., selling price is either highly variable or uncertain), the remaining promised goods or services in the contract must have at least one observable (i.e., not estimated) stand-alone selling prices in order to use the residual approach. That is, unlike Section 23, under IFRS 15, the residual approach cannot be used if there is no observable selling price for any of the goods or services in the contract.

2.4 Allocation of a discount or variable consideration

Both IFRS 15 and Section 23 provide two exceptions to the default method of allocating the transaction price to all performance obligations using the relative stand-alone selling price method. The two exceptions relate to the allocation of a discount and to variable consideration. For this purpose, a discount refers to the excess, if any, of the sum of the stand-alone selling prices of the goods or services promised in the contract over the promised consideration. Under these exceptions, a discount or variable consideration might be attributable to the entire contract or to a specific part of the contract.

Unlike Section 23, IFRS 15 includes specific criteria that must be met for these exceptions to apply. The criteria that must be satisfied to apply the allocation exception to variable consideration are different from the criteria for discounts. Where the respective criteria are met, discounts and variable consideration must be entirely allocated to one or more, but not all, performance obligations in the contract. [IFRS 15.83, IFRS 15.85]. However, under Section 23, the allocation requirements for discounts and variable consideration are combined into a single general requirement. This requires the exception to be applied, and another method used, if allocation using a relative stand-alone price method does not depict the amount of consideration to which the entity expects to be entitled in exchange for satisfying each performance obligation in the contract. [FRS 102.23.74]. This is a simplification introduced to provide flexibility in allocating discounts or variable consideration in the contract. [FRS 102.BC.B23.9]. See 7 below for further discussion.

Also, unlike Section 23, IFRS 15 establishes a hierarchy for allocation. Under IFRS 15, an entity identifies and allocates variable consideration first, if it meets the criteria for the exception, to one or some, but not all performance obligations. The general guidance related to allocation of transaction price to performance obligations on a relative stand-alone selling price basis and the specific requirements related to allocation of a discount are then applied to allocate the remaining amount of the transaction price that does not meet the criteria related to allocation of variable consideration. [IFRS 15.86].

In addition, when an entity meets the specified criteria and applies a discount to one or more performance obligations, IFRS 15 requires that the discount is allocated first before using the residual approach to estimate the stand-alone selling price of a good or service. [IFRS 15.83].

2.5 Capitalisation of costs to obtain a contract

Under IFRS 15, an entity recognises as an asset the incremental costs of obtaining a contract with a customer, if the entity expects to recover those costs. [IFRS 15.91]. Unlike IFRS 15, Section 23 allows an accounting policy choice on whether to expense or capitalise its incremental costs to obtain a contract with a customer that the entity expects to recover. [FRS 102.23.113].

A practical expedient is available under IFRS 15 where an entity could recognise the incremental costs of obtaining a contract as an expense when incurred if the amortisation period of the asset that the entity otherwise would have recognised is one year or less. [IFRS 15.94]. A practical expedient similar to IFRS 15 is also available under Section 23, if an entity adopts a policy of recognising costs to obtain a contract as an asset. [FRS 102.23.114]. See 10.3.1 below for further discussion.

2.6 Disclosures

IFRS 15 requires a comprehensive and coherent set of revenue recognition disclosures. It contains a disclosure objective and detailed disclosure requirements including both quantitative and qualitative information. The disclosure requirements under Section 23 are similar to the requirements in IFRS 15 but at a reduced level to provide proportionate and practical solutions that are cost effective to apply. In addition, under Section 23, certain disclosure exemptions are available to qualifying entities.

See 11 below for the disclosure requirements of Section 23 and see 13 below for a summary of GAAP differences, which includes differences between the disclosure requirements of Section 23 and IFRS 15.

3 Requirements of Section 23

3.1 Scope

3.1.1 Scope of Section 23

Section 23 applies to all entities and all contracts with customers to provide goods or services in the ordinary course of business (see 3.1.3 below), except for the following contracts, which are specifically excluded: [FRS 102.23.1]

- Lease contracts within the scope of Section 20.
- Contracts within the scope of FRS 103.
- Financial instruments and other contractual rights or obligations within the scope of Section 9 *Consolidated and Separate Financial Statements*, Section 11, Section 12, Section 14 *Investments in Associates* and Section 15 *Joint Ventures*.

And

- Non-monetary exchanges between entities in the same line of business to facilitate sales to customers or potential customers (see 4.1.1 below).

In addition to the above, Section 23 specifically excludes incoming resources from non-exchange transactions for public benefit entities, which are within the scope of Section 34 *Specialised Activities* (see Chapter 36 at 6.4).

Arrangements must meet the criteria set out in paragraph 23.7 of FRS 102, which are discussed in 4.1 below, to be accounted for as a revenue contract under Section 23.

For certain arrangements, entities have to evaluate their relationship with the counterparty to the contract in order to determine whether a vendor-customer relationship exists. Some collaboration arrangements, for example, are more akin to a partnership, while others have a vendor-customer relationship. Only transactions that are determined to be with a customer are within the scope of Section 23. The definition of a customer is discussed in 3.1.3 below. See 3.1.4 below for a discussion on collaborative arrangements.

The interaction between Section 23 and other sections of FRS 102 can be challenging and might require significant judgement. Such interactions include when:

- An entity needs to apply requirements of other sections of FRS 102 to assets and liabilities arising from a revenue contract (e.g., applying certain requirements in Section 11 to contract assets, determining when an entity's right to consideration becomes unconditional (i.e., a receivable) such that Section 11 applies to that asset instead of Section 23, see 11.1 below for further discussion).
- Other sections of FRS 102 refer to guidance in Section 23 (e.g., the accounting for disposals of certain non-financial assets - as discussed in 3.1.6.C below or applying requirements in Section 23 to service concession arrangements that are within the scope of Section 34 - see Chapter 36 at 4).
- Two or more contracts need to be assessed together to determine the appropriate section(s) of FRS 102 to apply (e.g., sales with repurchase agreements (see 8.3 below) or sale and leaseback arrangements within the scope of Section 20).
- The legal form of the arrangement is not consistent with the substance. Accounting for such a transaction depends on the substance of the transaction and not its legal form. For example, if a contract is a lease in legal form but the arrangement does not meet the definition of a lease because the 'lessor' has a substantive right to substitute the underlying asset throughout the period of use and, hence, is out of scope of Section 20 (see Chapter 23 at 3), that entity might be providing a service within the scope of Section 23.
- A contract falls within the scope of more than one section of FRS 102 (e.g., a lease with a non-lease revenue component, a contract that includes the issuance of a financial instrument and a revenue component within the scope of Section 23). When entities enter into transactions that are partially within the scope of Section 23 and partially within the scope of other sections of FRS 102, Section 23 requires an entity to apply any separation and/or measurement requirements in the other section of FRS 102 first, before applying the requirements in Section 23. [FRS 102.23.3]. See 3.1.5 below for further discussion.

Many entities issue warranties together with, and/or related to, goods or services provided to a customer. While Section 23 of FRS 102 provides guidance that applies to warranties, some might be within the scope of FRS 103. Determining whether Section 23 of FRS 102 or FRS 103 applies might require significant judgement. This is discussed further in 10.1 below. If FRS 103 applies to a warranty within a contract with a customer, the requirements in FRS 102.23.3 will need to be considered to determine how to allocate the contract consideration between the two standards. See 3.1.5 below for further discussion.

3.1.1.A Non-monetary exchanges

Section 23 does not apply to non-monetary exchanges between entities in the same line of business to facilitate sales to customers or potential customers. For example, it does not apply to a contract between two oil companies that swap oil to fulfil demand from their respective customers in different locations on a timely basis and to reduce transportation costs. This scope exclusion applies even though the party exchanging goods or services with the entity might meet the definition of a customer on the basis that it has contracted with the entity to obtain an output of the entity's ordinary activities (see 3.1.3 below). This type of scenario might be common in industries with homogeneous products.

Not all non-monetary exchanges between entities are outside the scope of Section 23 and it does provide requirements for contracts involving non-cash consideration in exchange for goods or services (see 6.6 below on non-cash consideration and 6.6.2 below on barter transactions). Therefore, determining whether an exchange is to facilitate a sale to a customer could require judgement. Judgement might also be needed to determine whether entities are in the same line of business.

The following Illustration shows some of these considerations:

Illustration 2-1: Non-monetary exchange outside the scope of Section 23

An automobile dealer exchanges new model automobiles with another dealer to obtain the colour ordered by a customer. This non-monetary exchange is intended to facilitate a sale to a customer who is not a party to the exchange. In addition, it involves the exchange of inventory that both dealers hold for sale, as part of their ordinary activities (see 3.1.3 below), and the automobile dealers are in the same line of business. Accordingly, this transaction is outside the scope of Section 23.

Illustration 2-2: Non-monetary exchange in the scope of Section 23

An office supply retailer provides office equipment and supplies to an automobile dealer in exchange for an automobile. The automobile dealer will use the office equipment and supplies in its financing department. The new equipment is an upgrade from the automobile dealer's old equipment and will allow the automobile dealer to reduce administrative expenses. The office supply retailer will use the car received in its repair department, allowing the department to reduce response times and meet service level commitments. Although the exchange involves inventory held for sale by each entity, the transaction is not an exchange of a product held for sale in the ordinary course of business (see 3.1.3 below), for a product to be sold in the same line of business to facilitate sales to customers. Accordingly, this transaction is within the scope of Section 23 for each entity.

3.1.2 Other scope considerations

Certain arrangements executed by entities include repurchase provisions, either as a component of a sales contract or as a separate contract that relates to the same, or similar goods, in the original agreement. The form of the repurchase agreement and whether the customer obtains control of the asset will determine whether the agreement is within the scope of Section 23. See 8.3 below for a discussion of repurchase agreements.

Section 23 also specifies the accounting for certain costs, such as the incremental costs of obtaining a contract and the costs of fulfilling a contract. However, these requirements only apply if there are no other applicable requirements in other sections of FRS 102 for those costs. See 10.3 below for further discussion of the requirements relating to contract costs in Section 23.

Certain requirements in Section 23 are also relevant for the recognition and measurement of a gain or loss on the disposal of a non-financial asset not in the ordinary course of business (see 3.1.3 below and 3.1.6.C below for further discussion about determining whether a transaction is part of an entity's ordinary activities).

Entities sometimes enter into transactions with suppliers that result in the entity receiving consideration from a supplier (or from other parties that sell the goods or services to the supplier). In these situations, entities need to apply judgement to determine whether they need to account for the consideration received as revenue in accordance with the relevant section of FRS 102 (e.g., Section 23, Section 20, Section 11 or Section 12), a reimbursement of a cost incurred on behalf of a supplier, or a reduction of the cost of goods or services acquired. For further discussion of this topic, entities reporting under FRS 102 could also refer to our publication *Applying IFRS: Accounting for Payments from Suppliers*.¹¹⁶

3.1.3 Definition of a customer

FRS 102 defines a customer as “a party that has contracted with an entity to obtain goods or services that are an output of the entity’s ordinary activities in exchange for consideration.” [FRS 102 Appendix I]. As discussed in Chapter 6 at 5.1.2, in the context of applying the requirements of Section 23, we believe that the reference to ‘ordinary activities’ pertains to primary business activities of an entity, rather than the incidental activities. Consequently, a customer in a revenue contract is a party that has contracted with an entity to obtain goods or services that are an output of the entity’s primary business activities (rather than its incidental activities) in exchange for consideration.

In many transactions, the customer is easily identifiable. However, in transactions involving multiple parties, it might be less clear which counterparties are customers of the entity. For some arrangements, multiple parties could all be considered customers of the entity, while in other arrangements only some of the parties involved are considered customers.

During times of geopolitical and economic uncertainty, governments might grant wide-ranging assistance, particularly if there are restrictions on business activities. Identifying whether there is vendor-customer relationship might be challenging if the counterparty in an arrangement is the government or a similar body. To determine the appropriate section of FRS 102 to apply, an entity needs to consider all relevant facts and circumstances to understand whether there is an exchange transaction arising from a vendor-customer relationship (to which Section 23 applies) or if, for example, the entity is receiving government assistance or a grant (in scope of Section 24 *Government Grants* - see Chapter 26). Factors to consider include, but are not limited to, whether the government (or similar body) is providing assistance to the entity or to its customer (e.g., by paying the entity on a customer’s behalf), and whether the government (or similar body) is providing assistance in their capacity as the government (or similar body) or as the entity’s customer. An entity with an existing vendor-customer relationship with a government or similar body also needs to evaluate whether any additional assistance is a modification of a customer contract under Section 23. See 4.4 below for contract modifications.

The Illustration below shows how the party considered to be the customer might differ, depending on the specific facts and circumstances:

Illustration 2-3: Identification of a customer

An entity provides internet-based advertising services to companies. As part of those services, the entity purchases banner-space on various websites from a selection of publishers. For certain contracts, the entity provides a sophisticated service of matching the ad placement with the pre-identified criteria of the advertising party (i.e., the customer). In addition, the entity pre-purchases the banner-space from the publishers before it finds advertisers for that space. Assume that the entity appropriately concludes it is acting as the principal in these contracts (see 5.4 below for further discussion on principal versus agent considerations). Accordingly, the entity identifies that its customer is the advertiser to whom it is providing services.

In other contracts, the entity simply matches advertisers with the publishers in its portfolio, but the entity does not provide any sophisticated ad-targeting services or purchase the advertising space from the publishers before it finds advertisers for that space. Assume that the entity appropriately concludes it is acting as the agent in these contracts. Accordingly, the entity identifies that its customer is the publisher to whom it is providing services.

In addition, the identification of the performance obligations in a contract (discussed further in 5 below) can have a significant effect on the determination of which party is the entity’s customer. Also see the discussion of the identification of an entity’s customer when applying the guidance on consideration paid or payable to a customer in 6.7 below.

¹¹⁶ Available on [ey.com/IFRS](https://www.ey.com/IFRS).

3.1.4 Collaborative arrangements

Entities often enter into collaborative arrangements to, for example, jointly develop and commercialise intellectual property such as a drug candidate in the life sciences industry or a motion picture in the entertainment industry. In such arrangements, a counterparty might not always be a 'customer' of the entity. Instead, the counterparty might be a collaborator or partner that shares in the risks and benefits of developing a product to be marketed. This is common in the pharmaceutical, biotechnology, oil and gas, and health care industries. However, depending on the facts and circumstances, these arrangements might also contain a vendor-customer relationship component. Such contracts could still be within the scope of Section 23, at least partially, if the collaborator or partner meets the definition of a customer for some, or all, aspects of the arrangement. If the collaborator or partner is not a customer, the transaction is not within the scope of Section 23.

In determining whether certain revenue-generating collaborative arrangements are within the scope of Section 23, the parties to such arrangements need to consider all facts and circumstances to determine whether a vendor-customer relationship exists that is subject to Section 23. However, in some circumstances, it might be appropriate for an entity to apply the principles in Section 23 to collaborations or partnerships (e.g., when there are no applicable or more relevant requirements that could be applied).

How we see it

Identifying the customer can be difficult, especially when multiple parties are involved in a transaction. This evaluation might require significant judgement and Section 23 does not provide many factors to consider.

Furthermore, transactions among partners in collaboration arrangements are not within the scope of Section 23. Therefore, entities need to use judgement to determine whether transactions are between partners acting in their capacity as collaborators or reflect a vendor-customer relationship.

3.1.5 Interaction with other sections of FRS 102 or other FRSs

Section 23 provides requirements for arrangements partially within the scope of Section 23 and partially within the scope of other sections of FRS 102 that apply to contracts with customers, as follows:

[FRS 102.23.3]

Extract from Section 23

23.3 A contract with a customer may be partially within the scope of this section and partially within the scope of other sections (eg a lease contract that includes the provision of services). If the other section specifies how to separate or initially measure any parts of the contract, then an entity shall first apply the separation or measurement requirements in that section. Otherwise, the entity shall apply this section to separate or initially measure those parts of the contract.

The requirements described above are only applicable to contracts that are partially within the scope of Section 23 and partially within the scope of any of the other sections of FRS 102. The requirements do not apply to contracts that might be partially within the scope of Section 23 and partially within the scope of other FRSs (e.g., FRS 103). [FRS 102.23.3].

Consider the following example:

Illustration 2-4: Transactions that might be in the scope of multiple sections of FRS 102 and/or other FRSs

A bank, Company A, offers credit cards to consumers. The credit cards provide lending facilities that allow cardholders to make purchases on deferred payment terms. Cardholders pay an annual fee to obtain a credit card, and in return are entitled to ancillary services, such as concierge services. In addition, Company A provides guarantees to cardholders in respect of goods or services purchased using the credit card.

Company A must consider whether this contract is entirely, or partially, within the scope of one, or multiple, sections of FRS 102 and/or other FRSs before it assesses whether Section 23 applies. For example, the guarantee provided to cardholders might give rise to an insurance contract that needs to be accounted for by applying FRS 103 (see Chapter 38). Furthermore, Company A must determine whether the fees and other features of the credit card arrangement are within the scope of Section 11 (see Chapter 11). Only any remaining components of the arrangement that are not in scope of any other sections of FRS 102 and/or other FRSs are accounted for by applying Section 23 (see Question 2-4 below), if in the scope of that section.

If a component of the arrangement is covered by another section of FRS 102 and that other section specifies how to separate and/or initially measure that component, an entity needs to first apply that section of FRS 102. An entity then applies Section 23 to the remaining components of the arrangement. Some examples of where separation and/or initial measurement are addressed in other sections of FRS 102 include the following:

- Section 11 and Section 12 generally require a financial instrument to be recognised at the transaction price, or when appropriate, at fair value, at initial recognition. For contracts that include the issuance of a financial instrument and revenue components within the scope of Section 23 and the financial instrument is required to be initially recognised at fair value, the fair value of the financial instrument is first measured and the remainder of the estimated contract consideration is allocated among the other components in the contract that are accounted for in accordance with Section 23.
- A contract might contain a lease coupled with an agreement to sell other goods or services (e.g., subject to Section 23). Section 20 requires that a lessor accounts separately for the lease component (in accordance with Section 20) and any non-lease components (in accordance with other sections of FRS 102) and provides guidance on separating the components of such a contract. [FRS 102.20.27-20.30]. A lessor allocates the consideration in a contract that contains a lease component and one or more additional lease or non-lease components by applying the requirements in Section 23 for allocating the transaction price to performance obligations and changes in the transaction price after contract inception (see 7 below). [FRS 102.20.36]. Care might be needed in such an allocation if the lease term (under Section 20) and the contract duration (under Section 23) differ. See Chapter 23 for more information on Section 20.

Conversely, if a component of the arrangement is covered by another section of FRS 102, but that section does not specify how to separate and/or initially measure that component, the entity needs to apply Section 23 to separate and/or initially measure each component. For example, specific requirements do not exist for the separation and measurement of the different parts of an arrangement when an entity sells a business and also enters into a long-term supply agreement with the other party. See 7.5 below for further discussion of the effect on the allocation of arrangement consideration when an arrangement includes both revenue and non-revenue components.

As noted above, if a contract includes a component that is covered by another FRS (e.g., FRS 103 in Illustration 2-4 above), the requirements of paragraph 23.3 of FRS 102 (as described above) do not apply. Since the requirements of Section 23 do not apply, if the other FRS does not specify how to separate the components between the FRSS, an entity would need to apply the requirements in Section 10 of FRS 102 to develop an accounting policy to determine how to separate the parts of the contract between Section 23 of FRS 102 and the other FRS. When developing its policy, an entity must, in accordance with Section 10 of FRS 102, refer to, and consider the applicability of requirements and guidance in an FRS (which could be Section 23 of FRS 102) that deals with similar and related issues. [FRS 102.10.5].

The requirements in IFRS 15.7 to separate or initially measure part (or parts) of a contract are only applicable to contracts that are partially within the scope of IFRS 15 and partially within the scope of any of the other adopted IFRS that are listed in IFRS 15.5 (see 13 below for the list). Included in that list are insurance contracts within the scope of IFRS 17 *Insurance Contracts*. By contrast, under Section 23, the requirements in paragraph 23.3 of FRS 102 to separate or initially measure any parts of the contract are applicable to all contracts that might be partially within the scope of other sections of FRS 102. Insurance contracts are within the scope of FRS 103, not within FRS 102.

Also, as described above, the scope of paragraph 23.3 is applicable to all contracts that might be partially within the scope of other sections of FRS 102. In contrast, the scope of paragraph 7 of IFRS 15 is narrow and not applicable to all contracts that might be partially within the scope of another adopted IFRS that is not specifically listed in paragraph 5 of IFRS 15.

Frequently asked questions

Question 3-1: Are pre-production activities in the scope of Section 23?

Manufacturing and production entities in various industries might perform activities and incur costs before they produce goods. In some arrangements (including long-term supply arrangements), entities perform upfront engineering and design activities and/or incur costs related to set-up activities to create new technology or adapt existing technology according to the needs of the customer. These pre-production activities are often a prerequisite to delivering any units under a production contract.

Entities need to evaluate whether the pre-production activities are promises in a contract with a customer (and potentially performance obligations) under Section 23. When making this evaluation, entities need to determine whether the activities transfer a good or service to a customer. See Question 5-1 in 5.1 below for further discussion on determining whether pre-production activities are promised goods or services under Section 23. If an entity determines that these activities are promised goods or services, it will apply the requirements in Section 23 to those goods or services. Also see Question 5-1 in 5.1 below and Questions 10-17 and 10-18 in 10.3.2 below for a discussion of scope and accounting considerations for costs related to pre-production activities and pre-contract or set-up activities, respectively.

Question 3-2: Are sales of by-products or scrap materials in the scope of Section 23?

Consider an example in which a consumer products entity sells by-products or accumulated scrap materials that are produced as a result of its manufacturing process. In determining whether the sale of by-products or scrap materials to third parties is in the scope of Section 23, an entity first determines whether the sale of such items is an output of the entity's ordinary activities (see 3.1.3 above). This is because FRS 102 defines revenue as "income arising in the course of an entity's ordinary activities".

[FRS 102 Appendix I]. If an entity determines the sale of such items represents revenue from a contract with a customer, it would generally recognise the sale under Section 23.

If an entity determines that such sales are not in the course of its ordinary activities, the entity would recognise those sales separately from revenue from contracts with customers because they represent sales to non-customers.

Question 3-3: Are the sales of prepaid gift cards within the scope of Section 23?

Entities might sell prepaid gift cards in their normal course of business in exchange for cash. The prepaid gift cards typically provide the customer with the right to redeem those cards in the future for goods or services of the entity and/or third parties. For any unused balance of the prepaid gift cards, entities need to recognise a liability that will be released upon redemption of that unused balance. However, the features of each prepaid gift card might vary and the nature of the liability depends on the assessment of these features. Entities might need to use judgement in order to determine whether the prepaid gift card is within the scope of Section 23 or another section of FRS 102.

Prepaid gift cards that give rise to financial liabilities are within the scope of Section 11 and Section 12 (see Chapter 11). If a prepaid gift card does not give rise to a financial liability, it is likely to be within the scope of Section 23. See Illustration 7-13 in 7.5 below for an example of a prepaid gift cards that give rise to financial liabilities.

For further guidance on applying Section 23 to prepaid gift cards within its scope, see 8.9 below.

Question 3-4: How does a utility entity determine whether a contract that includes a non-refundable upfront fee received for establishing a connection to a network (i.e., a connection fee) is within the scope of Section 23?

See response to Question 6-30 in 6.8 below.

Question 3-5: Are equity instruments issued by an entity to a customer in connection with a revenue arrangement within the scope of Section 23?

Whether or not an entity needs to apply Section 23 to a transaction in which equity instruments (e.g., shares) are issued to a customer in connection with a revenue arrangement depends on the substance and purpose of the transaction.

Many entities make payments to their customers. In some cases, the consideration paid or payable represents purchases by the entity of goods or services offered by the customer that satisfy a business need of the entity. In other cases, the consideration paid or payable represents incentives given by the entity to entice the customer to purchase, or continue purchasing, its goods or services.

According to paragraph 23.3 of FRS 102, a contract with a customer might be partially within the scope of Section 23 and partially within the scope of other sections of FRS 102. Section 23 does not specify whether equity instruments issued by an entity to a customer are a type of consideration paid or payable to customer, nor does Section 26 *Share-based Payment* specifically address such transactions.

How we see it

Depending on the facts and circumstances, several standards (or a combination of standards) might be applicable (e.g., Section 22 *Financial Liabilities and Equity*, Section 23, Section 26). To determine the substance of the transaction and which section(s) apply, entities will need to consider all relevant facts and circumstances, including the purpose of the transaction. Such determinations might require significant judgement.

3.1.6 Other income and other revenue

As income and revenue are defined broadly, not all income-generating transactions are in the scope of Section 23. As discussed in 3.1.1 above, an entity applies Section 23 only to a contract in which the counterparty to the contract meets the definition of a customer (unless the contract is specifically excluded from the scope of Section 23 (see 3.1.1 above for a list of scope exclusions)).

Below, we highlight some other items of income that are not within the scope of Section 23 and note whether they are covered by another section of FRS 102. Some of these items of income might represent other revenue (i.e., non-Section 23 revenue) if they are part of the entity's ordinary activities (see 3.1.3 above). For a further discussion of whether income outside the scope of Section 23 can be presented as revenue, please see Question 11.7 in 11.2 below.

3.1.6.A Income and distributable profits

In general, neither FRS 102 nor adopted IFRS address the issue of the distribution of profit. Whether or not revenue and gains recognised in accordance with FRS 102 or adopted IFRS are distributable to shareholders of an entity will depend entirely on the national laws and regulations with which the entity needs to comply. The fact that income is reported in accordance with FRS 102 or adopted IFRS does not necessarily imply that such income is either realised or distributable under a reporting entity's applicable national legislation.

In the UK, the determination of profits available for distribution is a complex area where accounting and company law interface. In determining profits available for distribution, a UK entity could refer to Technical Release 02/17BL *Guidance on realised and distributable profits under the Companies Act 2006* issued by the Institute of Chartered Accountants in England and Wales and the Institute of Chartered Accountants of Scotland, or any successor document, to determine profits available for distribution. [FRS 102.A3.29].

3.1.6.B Interest and dividends

Entities (e.g., financial institutions) might earn interest or dividends in the course of their ordinary activities (see 3.1.3 above) and, therefore, present these transactions as revenue. The relevant recognition and measurement requirements are included in Section 11 and/or Section 12. These transactions are recognised as follows:

- Interest: using the effective interest method [FRS 102 Appendix I, FRS 102.11.16] as discussed in Chapter 13 at 6.2.
- Dividends: when the shareholder's right to receive payment is established, it is probable that the economic benefits associated with the dividend will flow to the entity and the amount of the dividend can be measured reliably. [FRS 102.11.14A, FRS 102.12.9A]. See Chapter 13 at 6.3.2.

3.1.6.C Disposal of non-financial assets not in the ordinary course of business

When an entity disposes of an asset that is within the scope of Section 16 *Investment Property*, Section 17 or Section 18 *Intangible Assets other than Goodwill*, and that disposal is not part of the entity's ordinary activities, the transaction is within the scope of those sections, not Section 23. Accounting for derecognition of investment property is not addressed specifically within Section 16 (see Chapter 19 at 3.5), while Section 18 provides limited guidance on derecognising an intangible asset (see Chapter 21 at 3.3.6). However, Section 17 includes requirements in respect of derecognition of an item of PP&E. Section 17 also requires entities to apply certain requirements in Section 23 when determining the date of disposal of an item of PPE and consequent timing of the recognition of gains or losses arising from the

disposal. [FRS 102.17.29]. Section 17 requires that the gain or loss arising from the disposal of an item of PP&E be included in profit or loss when the item is derecognised (i.e., at the date the recipient obtains control of that item), unless Section 20 requires otherwise on a sale and leaseback transaction. Section 20 applies to disposal via a sale and leaseback. [FRS 102.17.29]. The gain or loss on disposal of an item of PP&E is the difference between the net disposal proceeds, if any, and the carrying amount of the item. [FRS 102.17.30]. Applying the GAAP hierarchy in Section 10, an entity could apply the derecognition requirements in Section 17 to the derecognition of an investment property or an intangible asset. [FRS 102.10.6].

When presenting gains on disposal of an item of PP&E in the income statement, Section 17 specifically prohibits classification of any such gain as revenue. [FRS 102.17.28]. However, there is an exception in the case of entities that are in the business of renting and subsequently selling the same assets (discussed in 3.1.6.D below). In contrast, the sale of investment property is generally not recognised as revenue. The rationale and possible treatment of investment property in such cases are discussed in detail in Chapter 19 at 3.4, 3.5 and 4.2.

3.1.6.D Sale of assets held for rental

In general, Section 17 prohibits the classification of gains arising from the derecognition of PP&E as revenue. [FRS 102.17.28]. However, Section 17 does not specify accounting for entities that are in the business of renting and subsequently selling the same asset. In this case, applying the GAAP hierarchy in Section 10, an entity could follow the specific provisions in paragraph 16 of IAS 16. [FRS 102.10.6]. The IASB has agreed that the presentation of revenue, rather than a net gain or loss on the sale of the assets, would better reflect the ordinary activities (see 3.1.3 above) of such entities. [IAS 16.BC35C]. See Chapter 20 at 3.8.1 and Chapter 6 at 5.1.2 for further discussion.

Therefore, where an entity, in the course of its ordinary activities (see 3.1.3 above), routinely sells to others items of PP&E, that it has held for rental, the entity transfers the assets to inventories at their carrying amount when they cease to be rented and become held for sale. The proceeds from the sale of such assets are recognised as revenue in accordance with IFRS 15 (or, in this case, Section 23 of FRS 102) on a gross basis. [IAS 16.68A].

In the cash flow statement, the above results in presentation within operating activities of cash payments to manufacture or acquire such assets and cash receipts from rents and sales of such assets (see Chapter 20 at 3.7.1).

3.2 Revenue recognition model

Section 23 describes the principles an entity must apply to measure and recognise revenue and the related cash flows. The section establishes a revenue recognition model for accounting for revenue from contracts with customers. The objective of the model is for an entity to recognise revenue to depict the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods or services. [FRS 102.23.4].

To apply the model, the principles in Section 23 are applied using the following five steps: [FRS 102.23.4]

1. Identify the contract(s) with a customer (see 4 below)
2. Identify the performance obligations in the contract (see 5 below)
3. Determine the transaction price (see 6 below)
4. Allocate the transaction price to the performance obligations in the contract (see 7 below)
5. Recognise revenue when (or as) the entity satisfies a performance obligation (see 8 below)

Entities need to exercise judgement when considering the terms of the contract(s) and all of the facts and circumstances, including implied contract terms. Entities also have to apply the requirements of Section 23 consistently to contracts with similar characteristics and in similar circumstances. [FRS 102.23.5].

The five-step model is applied to individual contracts with customers, unless the contract combination requirements discussed in 4.3 below are met. However, there might be situations in which it could be practical for an entity to group contracts for revenue recognition purposes i.e., an entity could use the 'portfolio approach' for similar contracts (or performance obligations). This is discussed further in 4.3.1 below). [FRS 102.23.6].

4 Step 1 – Identify the contract with a customer

To apply the five-step model in Section 23, an entity must first identify the contract, or contracts, to provide goods or services to customers.

A contract is defined as ‘an agreement between two or more parties that creates enforceable rights and obligations’. [FRS 102 Appendix I]. Accordingly, a contract with a customer that creates enforceable rights and obligations fall within the scope of the model in Section 23. Such contracts might be written, oral or implied by an entity’s customary business practices. For example, if an entity has an established practice of starting performance based on oral agreements with its customers, it might determine that such oral agreements meet the definition of a contract. As a result, an entity might need to account for a contract as soon as performance begins, rather than delay revenue recognition until the arrangement is documented in a signed contract.

Certain arrangements might require a written contract to comply with laws or regulations in a particular jurisdiction. These requirements must be considered when determining whether a contract exists. That is, entities need to look at the relevant legal framework to determine whether the contract is enforceable because factors that determine enforceability might differ among jurisdictions.

Note also that, while the contract must be legally enforceable to be within the scope of the model in Section 23, all of the promises do not have to be enforceable to be considered performance obligations (see 5.1 below). That is, a performance obligation can be based on the customer’s valid expectations (e.g., due to the entity’s customary business practice of providing an additional good or service that is not specified in the contract). [FRS 102.23.19]. In addition, Section 23 clarifies that some contracts have no fixed duration and can be terminated or modified by either party at any time. Other contracts automatically renew on a specified periodic basis. Entities are required to apply Section 23 to the contractual period in which the parties have present enforceable rights and obligations. [FRS 102.23.11]. Contract enforceability and termination clauses are discussed in 4.2 below.

Illustration 4-1: Oral contract

IT Support Ltd. provides online technology support for customers remotely via the internet. For a fixed fee, IT Support Ltd. will scan a customer’s personal computer (PC) for viruses, optimise the PC’s performance and solve any connectivity problems. When a customer calls to obtain the scan services, IT Support Ltd. describes the services it can provide and states the price for those services. When the customer agrees to the terms stated by the representative, payment is made over the telephone. IT Support Ltd. then gives the customer the information it needs to obtain the scan services (e.g., an access code for the website). It provides the services when the customer connects to the internet and logs onto the entity’s website (which might be that day or a future date).

In this example, IT Support Ltd. and its customer are entering into an oral agreement, which is legally enforceable in this jurisdiction, for IT Support Ltd. to repair the customer’s PC and for the customer to provide consideration by transmitting a valid credit card number and authorisation over the telephone. The required criteria for a contract with a customer (discussed further in 4.1 below) are all met. As such, this agreement is within the scope of the model in Section 23 at the time of the telephone conversation, even if the entity has not yet performed the scanning services.

4.1 Attributes of a contract

To help entities determine whether (and when) their arrangements with customers are contracts within the scope of the model in Section 23, certain attributes of a contract must be present. The criteria, which must be all met before an entity applies the model in Section 23, are as follows: [FRS 102.23.7]

- The parties have approved the contract and are committed to perform their respective obligations.
- Each party’s rights regarding the goods or services to be transferred can be identified.
- Payment terms can be identified.
- The contract has commercial substance.
- It is probable that the customer will have the ability and intention to pay the consideration to which the entity will be entitled when it is due.

These criteria are assessed at the inception of the arrangement. If the criteria are met at that time, an entity does not reassess these criteria unless there is an indication of a significant change in facts and circumstances. [FRS 102.23.8]. IFRS 15 provides further guidance which entities reporting under FRS 102 could also consider. For example, as noted in paragraph 13 of IFRS 15 – if the customer’s ability to pay significantly deteriorates, an entity would have to reassess whether it is probable that the entity will collect

the consideration to which it is entitled in exchange for transferring the remaining goods or services under the contract. The updated assessment is prospective in nature and would not change the conclusions associated with goods or services already transferred. That is, an entity would not reverse any receivables, revenue or contract assets already recognised under the contract. [IFRS 15.BC34].

If the criteria are not met (and until the criteria are met), the arrangement is not considered a revenue contract under Section 23 and the requirements discussed in 4.5 below must be applied.

Section 23 does not contain examples to illustrate application of the above guidance. Entities could consider Example 4 in IFRS 15 which provides an example of a significant change in facts and circumstances that results in the reassessment of the contract criteria in paragraph 9 of IFRS 15 (which are similar to the criteria in paragraph 23.7 of FRS 102). [IFRS 15.IE Example 4, IFRS 15.IE14-IE17]. See also discussion in Question 4-5 in 4.1.5.B below.

Frequently asked questions

Question 4-1: Does a master supply arrangement (MSA) create enforceable rights and obligations to be considered a contract within the scope of the model in Section 23?

An entity might use an MSA to govern the overall terms and conditions of a business arrangement between itself and a customer (e.g., scope of services, pricing, payment terms, warranties and other rights and obligations). Typically, when an entity and a customer enter into an MSA, purchases are subsequently made by the customer by issuing a non-cancellable purchase order or an approved online authorisation that explicitly references the MSA and specifies the products, services and quantities to be delivered.

In such cases, the MSA is unlikely to create enforceable rights and obligations, which are needed to be considered a contract within the scope of the model in Section 23. This is because, while the MSA might specify the pricing or payment terms, it usually does not specify the specific goods or services, or quantities thereof, to be transferred. Therefore, each party's rights and obligations regarding the goods or services to be transferred are not identifiable. It is likely that the MSA and the customer order, taken together, would constitute a contract under Section 23. As such, entities need to evaluate both the MSA and the subsequent customer order(s) together to determine whether and when the criteria in paragraph 23.7 are met. [FRS 102.23.7].

If an MSA includes an enforceable clause requiring the customer to purchase a minimum quantity of goods or services, the MSA alone might constitute a contract under Section 23 because enforceable rights and obligations exist for this minimum amount of goods or services.

Question 4-2: How would an entity determine whether a contract exists within the scope of the model during a free trial period?

Free trial periods are common in certain subscription arrangements (e.g., magazines, streaming services). A customer might receive a number of 'free' months of goods or services at the inception of an arrangement; before the paid subscription begins; or as a bonus period at the beginning or end of a paid subscription period.

How we see it

Under Section 23, revenue is not recognised until an entity determines that a contract within the scope of the model exists. Once an entity determines that a Section 23 contract exists, it is required to identify the promises in the contract. Therefore, if the entity has transferred goods or services prior to the existence of a Section 23 contract, we believe that the free goods or services provided during the trial period would generally be accounted for as marketing incentives.

Consider an example in which an entity has a marketing programme to provide a three-month free trial period of its services to prospective customers. The entity's customers are not required to pay for the services provided during the free trial period and the entity is under no obligation to provide the services under the marketing programme. If a customer enters into a contract with the entity at the end of the free trial period that obliges the entity to provide services in the future (e.g., signing up for a subsequent 12-month period) and obliges the customer to pay for the services, the services provided as part of the marketing programme might not be promises that are part of an enforceable contract with the customer. However, if an entity, as part of a negotiation with a prospective customer, agrees to provide three free months of services if the customer agrees to pay for 12 months of services (effectively providing the customer a discount on 15 months), the entity would identify the free months as promises in the contract because the contract requires it to provide them.

The above interpretation applies if the customer is not required to pay any consideration for the additional goods or services during the trial period (i.e., they are free). If the customer is required to pay consideration in exchange for the goods or services received during the trial period (even if it is only a nominal amount), a different accounting conclusion could be reached. Entities need to apply judgement to evaluate whether a contract exists that falls within the scope of the model in Section 23.

Question 4-3: Do entities need to consider side agreements when determining whether a contract exists within the scope of the model?

All terms and conditions that create or negate enforceable rights and obligations must be considered when determining whether a contract exists under Section 23. Understanding the entire contract, including any side agreements or other amendments, is critical to this determination.

Side agreements are amendments to a contract that can be either undocumented or documented separately from the main contract. The potential for side agreements is greater for complex or material transactions or when complex arrangements or relationships exist between an entity and its customers. Side agreements might be communicated in many forms (e.g., oral agreements, email, letters or contract amendments) and could be entered into for a variety of reasons.

Side agreements might provide an incentive for a customer to enter into a contract near the end of a financial reporting period or to enter into a contract that it would not enter into in the normal course of business. Side agreements might entice a customer to accept delivery of goods or services earlier than required or could provide the customer with rights in excess of those customarily provided by the entity. For example, a side agreement might extend contractual payment terms; expand contractually stated rights; provide a right of return; or commit the entity to provide future products or functionality not contained in the contract or to assist resellers in selling a product. Therefore, if the provisions in a side agreement differ from those in the main contract, an entity assesses whether the side agreement creates new rights and obligations or changes existing rights and obligations. See 4.3 and 4.4 below, respectively, for further discussion of the Section 23's requirements on combining contracts and contract modifications.

4.1.1 Parties have approved the contract and are committed to perform their respective obligations

Before applying the model in Section 23, the parties must have approved the contract. A contract might not be legally enforceable without the approval of both parties. Furthermore, the form of the contract (i.e., oral, written or implied) is not determinative in assessing whether the parties have approved the contract. Instead, an entity must consider all relevant facts and circumstances when assessing whether the parties intend to be bound by the terms and conditions of the contract. In some cases, the parties to an oral or implied contract might have the intent to fulfil their respective obligations. However, in other cases, a written contract might be required before an entity can conclude that the parties have approved the arrangement.

In addition to approving the contract, the entity must be able to conclude that both parties are committed to perform their respective obligations. [FRS 102.23.7(a)]. That is, the entity must be committed to providing the promised goods or services. In addition, the customer must be committed to purchasing those promised goods or services. In the Basis for Conclusions on IFRS 15, the IASB clarified that an entity and a customer do not always have to be committed to fulfilling all of their respective rights and obligations for a contract to meet this requirement. The IASB cited, as an example, a supply agreement between two parties that includes stated minimums. The customer does not always buy the required minimum quantity and the entity does not always enforce its right to require the customer to purchase the minimum quantity. In this situation, the IASB stated that it might still be possible for the entity to determine that there is sufficient evidence to demonstrate that the parties are substantially committed to the contract. [IFRS 15.BC36]. This criterion does not address a customer's intent and ability to pay the consideration. Ability and intention to pay is a separate criterion and is discussed in 4.1.5 below.

Termination clauses are also an important consideration when determining whether both parties are committed to perform under a contract and, consequently, whether a contract within the scope of the model in Section 23 exists. See 4.2 below for further discussion of termination clauses and how they affect contract duration.

4.1.2 Each party's rights regarding the goods or services to be transferred can be identified

This criterion is relatively straightforward. If the goods or services to be provided in the arrangement cannot be identified, it is not possible to conclude that an entity has a contract within the scope of the model in Section 23. Furthermore, if the promised goods or services cannot be identified, the entity cannot assess whether those goods or services have been transferred because the entity would be unable to assess each party's rights with respect to those goods or services.

4.1.3 Payment terms can be identified

Identifying the payment terms does not require that the transaction price be fixed or stated in the contract with the customer. As long as there is an enforceable right to payment (i.e., enforceability as a matter of law) and the contract contains sufficient information to enable the entity to estimate the transaction price (see further discussion in 6 below), the contract would qualify for accounting under Section 23 (assuming the remaining criteria set out in paragraph 23.7 of FRS 102, discussed in 4.1 above, have been met).

4.1.4 Commercial substance

The model in Section 23 does not apply if an arrangement does not have commercial substance. Commercial substance means that either the risk, timing or amount of the entity's future cash flows is expected to change as a result of the contract. Historically, some entities in high-growth industries allegedly engaged in transactions to artificially inflate revenue; for example, goods or services might be transferred back and forth between the same entities in an attempt to show higher transaction volume and gross revenue (sometimes known as 'round-tripping'). This is also a risk in arrangements that involve non-cash consideration (e.g., barter transactions).

Determining whether a contract has commercial substance for the purposes of Section 23 might require significant judgement. In all situations, the entity must be able to demonstrate a substantive business purpose exists, considering the nature and structure of its transactions.

Section 23 does not contain requirements specific to barter transactions. Entities need to carefully consider the commercial substance criterion when evaluating these types of transactions (see 6.6.2 below for further discussion on barter transactions).

4.1.5 Ability and intention to pay

Under section 23, this criterion is described from the perspective of the customer, that is, it is probable that the customer will have the ability and intention to pay the amount of consideration to which the entity will be entitled when it is due. [FRS 102.23.7(e)]. Under IFRS 15 this criterion is described from the perspective of the entity, that is, it is probable that the entity will collect the consideration to which it is entitled. However, in evaluating whether collectability of an amount of consideration is probable, IFRS 15 requires an entity to consider only the customer's ability and intention to pay that amount of consideration when it is due. [IFRS 15.9(e)]. Considering the criterion is consistent with the corresponding requirement under IFRS 15, it is described as 'collectability' in this chapter. Entities reporting under FRS 102 could also consider further guidance in IFRS 15.

Note that in the Basis for Conclusions on IFRS 15, an entity needs to assess a customer's ability to pay based on the customer's financial capacity and its intention to pay considering all relevant facts and circumstances, including past experiences with that customer or customer class. [IFRS 15.BC45]. In the Basis for Conclusions on IFRS 15, the IASB noted that the purpose of the criteria in paragraph 9 of IFRS 15 (which is similar to the criteria in paragraph 23.7 of FRS 102) is to require an entity to assess whether a contract is valid and represents a genuine transaction. The collectability criterion (i.e., determining whether the customer has the ability and the intention to pay the promised consideration) is a key part of that assessment. In addition, the IASB noted that, in general, entities only enter into contracts in which it is probable that the entity will collect the amount to which it will be entitled. [IFRS 15.BC43]. That is, in most instances, an entity would not enter into a contract with a customer if there was significant credit risk associated with that customer without also having adequate economic protection to ensure that it would collect the consideration.

Paragraph 23.7(e) requires an entity to evaluate at contract inception whether it is *probable* that the customer will have the ability and intention to pay the 'consideration to which the entity will be entitled when it is due'. An entity is also required to reassess collectability after contract inception, when significant facts and circumstances change (see Question 4-5 in 4.1.5.B below for further discussion). [FRS 102.23.8]. We discuss each of the italicised concepts below:

- *Probable* - The term 'probable' is defined as "more likely than not". [FRS 102 Appendix I]. If it is not probable that the entity will collect amounts to which it is entitled, the model in Section 23 is not applied to the contract until the concerns about collectability have been resolved. However, other requirements in Section 23 apply to such arrangements (see 4.5 below for further discussion).
- *Consideration to which it will be entitled when it is due* - The amount of consideration that is assessed for collectability is the amount to which the entity will be entitled in exchange for the goods or services that will be transferred to a customer. That is, the amount of consideration assessed for collectability is often the transaction price, but it could be a lower amount in certain circumstances, as discussed further below. [FRS 102.23.7(e)].

It is important to note that the transaction price might be less than the stated contract price for the goods or services in the contract. Entities need to determine the transaction price in Step 3 of the model (as discussed in 6 below) before assessing the collectability of that amount. The contract price and transaction price most often will differ because of variable consideration (e.g., rebates, discounts, or explicit or implicit price concessions) that reduces the amount of consideration stated in the contract. For example, the transaction price for the items expected to be transferred might be less than the stated contract price for those items if an entity concludes that it has offered, or is willing to accept, a price concession on products sold to a customer. See 6.2.1.A below for further discussion on price concessions.

An entity deducts from the contract price any variable consideration that would reduce the amount of consideration to which it expects to be entitled (e.g., an estimated price concession) at contract inception in order to derive the transaction price for those items. The collectability assessment is then performed on the determined transaction price.

Note that in the Basis for Conclusions on IFRS 15, the IASB noted that, if the customer were to fail to perform as promised and the entity were able to stop transferring additional goods or services to the customer in response, the entity would not consider the likelihood of payment for those goods or services that would not be transferred in its assessment of collectability. [IFRS 15.BC46]. The IASB also noted that the assessment of collectability criterion requires an entity to consider how the entity's contractual rights to the consideration relate to its performance obligations. That assessment considers the business practices available to the entity to manage its exposure to credit risk throughout the contract (e.g., through advance payments or the right to stop transferring additional goods or services). [IFRS 15.BC46C].

In addition to the Section 23 collectability assessment, an entity has to assess any contract assets or trade receivables arising from a Section 23 contract for any impairment loss under Section 11 (for further discussion see 11.1 below and Chapter 13).

How we see it

At contract inception, significant judgement is required to determine when an expected partial payment indicates that: (i) there is an implied price concession in the contract that affects the determination of the transaction price and the amount assessed for collectability under Section 23; (ii) there is a credit loss (accounted for as an impairment loss under Section 11); or (iii) the arrangement lacks sufficient substance to be considered a contract under Section 23. See 6.2.1.A below for further discussion of implicit price concessions.

4.1.5.A Variable consideration versus credit risk

In some cases, it might be difficult to determine whether the entity has implicitly offered a price concession (i.e., variable consideration) or whether the entity has chosen to accept the risk of default by the customer of the contractually agreed-upon consideration (i.e., impairment losses under Section 11). Section 23 does not have guidance for distinguishing between price concessions (recognised as variable consideration through revenue) and a credit loss to be accounted for as an impairment loss under Section 11 (i.e., outside revenue). Therefore, an entity needs to consider all relevant facts and circumstances when analysing situations in which, at contract inception, it is willing to accept a lower price than the amount stated in the contract. In 6.2.1.A below, we discuss certain factors that might suggest the entity has implicitly offered a price concession to the customer.

After the entity has determined the amount to assess for collectability under paragraph 23.7(e), it also has to apply the requirements in Section 11 to account for any credit losses for the receivable (or contract asset) that is recorded (i.e., after consideration of any variable consideration, such as an implicit price concession). It presents any resulting impairment loss as an expense under Section 11 (i.e., not as a reduction of the transaction price). Illustration 6-2 included in 6.2.1.A below, Example 3 and Example 23 in IFRS 15 illustrate a situation where the transaction price that is evaluated for collectability is not the amount stated in the contract. In contrast, Illustration 4-3 in Question 4-4 in 4.1.5.B below illustrates a situation in which an entity, at contract inception, believes it is probable that its customers will pay amounts owed and the transaction price (i.e., revenue recorded) equals the contract price, even though, on a portfolio basis, 2% is not expected to be collected.

4.1.5.B Example of assessing the collectability criterion

Illustration 4-2 below, which is based on Example 1 in IFRS 15, shows how an entity might assess the collectability criterion: [IFRS 15.IE Example 1, IFRS 15.IE3-IE6]

Illustration 4-2: Collectability of the consideration

An entity, a real estate developer, enters into a contract with a customer for the sale of a building for £1 million. The customer intends to open a restaurant in the building. The building is located in an area where new restaurants face high levels of competition and the customer has little experience in the restaurant industry.

The customer pays a non-refundable deposit of £50,000 at inception of the contract and enters into a long-term financing agreement with the entity for the remaining 95% of the promised consideration. The financing arrangement is provided on a non-recourse basis, which means that if the customer defaults, the entity can repossess the building, but cannot seek further compensation from the customer, even if the collateral does not cover the full value of the amount owed. The entity's cost of the building is £600,000. The customer obtains control of the building at contract inception.

In assessing whether the contract meets the criteria in paragraph 23.7 of FRS 102, the entity concludes that the criterion in paragraph 23.7(e) is not met because it is not probable that the entity will collect the consideration to which it is entitled in exchange for the transfer of the building. In reaching this conclusion, the entity observes that the customer's ability and intention to pay might be in doubt because of the following factors:

- (a) The customer intends to repay the loan (which has a significant balance) primarily from income derived from its restaurant business (which is a business facing significant risks because of high competition in the industry and the customer's limited experience).
 - (b) The customer lacks other income or assets that could be used to repay the loan.
- And

- (c) The customer's liability under the loan is limited because the loan is non-recourse.

Because the criteria in paragraph 23.7 are not met, the entity applies paragraphs 23.9 to 23.10 to determine the accounting for the non-refundable deposit of £50,000. The entity observes that none of the events described in paragraph 23.10 have occurred; that is, the entity has not received substantially all of the consideration and it has not terminated the contract. Consequently, in accordance with paragraph 23.9, the entity accounts for the non-refundable £50,000 payment as a deposit liability. The entity continues to account for the initial deposit, as well as any future payments of principal and interest, as a deposit liability, until such time that the entity concludes that the criteria in paragraph 23.7 are met (i.e., the entity is able to conclude that it is probable that the entity will collect the consideration) or one of the events in paragraph 23.10 has occurred. The entity continues to assess the contract in accordance with paragraph 23.9 to determine whether the criteria in paragraph 23.7 are subsequently met or whether the events in paragraph 23.10 have occurred.

Frequently asked questions

Question 4-4: How would an entity assess collectability for a portfolio of contracts?¹¹⁷

If an entity has determined it is probable that a customer will have the ability and intention to pay amounts owed under a contract, but the entity has historical experience that some of the customers within a portfolio of contracts will not pay the consideration (see 4.3.1 below), it would be appropriate for the entity to record revenue for the contract in full and separately evaluate the corresponding contract asset or receivable for impairment. That is, the entity would not conclude the arrangement contains an implicit price concession and would not reduce revenue for the uncollectable amounts. See 6.2.1.A below for a discussion of evaluating whether an entity has offered an implicit price concession.

If an entity determines that payment by the customer is probable, that does not mean that the risk of a credit loss is zero. Entities still need to apply Section 11 to estimate the credit losses on contract assets or receivables resulting from the application of Section 23.

Consider the following Illustration:

Illustration 4-3: Assessing collectability for a portfolio of contracts

An entity has a large volume of similar customer contracts for which it invoices its customers in arrears, on a monthly basis. Before accepting a customer, the entity performs procedures designed to determine if it is probable that the customer will have the ability and intention to pay the amounts owed. It does not accept customers if it is not probable that the customer will pay the amounts owed. Because these procedures are only designed to determine whether the payment is probable (and, thus, not a certainty), the entity anticipates that it will have some customers that will not pay all of the amounts owed. While the entity collects the entire amount due from the vast majority of its customers, on average, the entity's historical evidence (which is representative of its expectations for the future) indicates that the customers will only pay 98% of the amounts invoiced.

In this case, the entity would recognise revenue for the full amount due. That is, when the entity satisfies the performance obligations in the contracts, it would recognise revenue of 100% of the amount due and a corresponding receivable for the same amount representing its unconditional right to the full consideration. It would then assess impairment in accordance with Section 11 for 2% of the amount due (i.e., the amount the entity does not expect to collect).

In this example, the entity concludes that collectability is probable for each customer based on procedures it performed prior to accepting each customer and on its historical experience with this customer class, while also accepting that there is some credit risk inherent with this customer class. Furthermore, the entity concludes that any amounts not collected do not represent implied price concessions. Instead, they are due to credit risk that is present in a limited number of customer contracts.

The analysis to determine whether to recognise an impairment loss for a contract in the same period in which revenue is recognised (instead of reducing revenue for an anticipated price concession) will require judgement. See Chapter 13 at 6.5 for further information on recognition and measurement of impairment under Section 11.

Question 4-5: When would an entity reassess collectability?¹¹⁸

As discussed in 4.1.5 above, paragraph 23.8 of FRS 102 requires an entity to reassess whether it is probable that it will collect the consideration to which it will be entitled when significant facts and circumstances change. [FRS 102.23.8]. Section 23 and IFRS 15 are consistent in this area and entities reporting under FRS 102 could consider the guidance provided in IFRS 15.

Example 4 in IFRS 15 illustrates a situation in which a customer's financial condition declines and its current access to credit and available cash on hand is limited. In this case, the entity does not reassess the collectability criterion. However, in a subsequent year, the customer's financial condition further declines after losing access to credit and its major customers. In the example, this subsequent change in the customer's financial condition is so significant that a reassessment of the criteria for identifying a contract is required, resulting in the collectability criterion not being met. [IFRS 15.IE Example 4, IFRS 15.IE14-IE17]. This shows that relatively minor changes (i.e., those that do not call into question the validity of the contract) do not need reassessment. Entities might need to exercise judgement to determine whether changes in the facts and circumstances are significant enough to indicate that a contract no longer exists under the standard.

¹¹⁸ Based on TRG Agenda paper no. 13, *Collectibility*, dated 26 January 2015 and TRG Agenda paper no. 25, *January 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 30 March 2015.

4.2 Contract enforceability and termination clauses

An entity has to determine the duration of the contract (i.e., the stated contractual term or a shorter period) before applying certain aspects of the revenue model (e.g., identifying performance obligations, determining the transaction price). The contract duration under Section 23 is the period in which parties to the contract have present enforceable rights and obligations. An entity cannot assume that there are present enforceable rights and obligations for the entire term stated in the contract and it is likely that an entity will have to consider enforceable rights and obligations in individual contracts, as described in Section 23: [FRS 102.23.11]

Extract from Section 23

23.11 Some contracts with customers may have no fixed duration or may automatically renew periodically. An entity shall apply this section to the duration of the contract (ie the contractual period) in which the parties to the contract have present enforceable rights and obligations.

The period in which enforceable rights and obligations exist might be affected by termination provisions in the contract. Significant judgement is required to determine the effect of termination provisions on the contract duration. Entities need to review the overall contractual arrangements, including any master service arrangements, wind-down provisions and business practices to identify terms or conditions that might affect the enforceable rights and obligations in their contracts.

This determination is critical because the contract duration to which Section 23 is applied might affect the number of performance obligations identified and the determination of the transaction price. It might also affect the amounts disclosed in some of the required disclosures. See Questions 4-6 to 4-8 below for further discussion of how termination provisions might affect the contract duration.

It is also worth considering further guidance provided in IFRS 15 on this matter. Under IFRS 15, if each party has the unilateral right to terminate a 'wholly unperformed' contract (as defined in IFRS 15.12) without compensating the counterparty, IFRS 15 states that, for purposes of the revenue standard, a contract does not exist and its accounting and disclosure requirements would not apply. This is because the contracts would not affect an entity's financial position or performance until either party performs. Any arrangement in which the entity has not provided any of the contracted goods or services and has not received or is not entitled to receive any of the contracted consideration is considered to be a 'wholly unperformed' contract. [IFRS 15.12].

Under IFRS 15, the requirements for 'wholly unperformed' contracts do not apply if the parties to the contract have to compensate the other party if either of them exercises their right to terminate the contract and the termination payment is considered substantive, and all facts and circumstances related to the contract need to be considered.

Because the contract duration is determined on the basis of the period over which the parties to the contract have present enforceable rights and obligations, certain economic factors (e.g., economic compulsion) are not considered in this assessment because they do not create or modify the present enforceable rights and obligations of either party in the contract.

For example, consider a long-term contract between an entity and a customer that permits the customer to terminate the contract at any time without paying a substantive termination penalty. The entity believes that it is virtually certain that the customer will not terminate the contract because the customer's business relies on a good or service that only the entity can provide. However, when determining the duration of the contract, the entity would not consider the perceived economic compulsion on the customer's part because it does not create or modify any present enforceable rights and obligations. As a result, the contract would have a shorter duration than the stated term because the terminating party is not required to compensate the other party.

Similarly, if there are no contractual penalties (e.g., termination fees, monetary penalties for not meeting contractual minimums), the contract duration does not extend beyond the period in which both parties have present enforceable rights and obligations even when a customer is expected to be economically compelled to exercise an option for additional goods and services (e.g., the customer would forgo a substantial discount on the optional purchases if it were to cancel the contract). Rather, the discount on optional purchases is assessed to determine whether it conveys a material right. See Question 5-19 in 5.6 below for further discussion.

How we see it

We believe that entities are required to account for contracts with longer stated terms as month-to-month (or possibly a shorter duration) contracts if the parties can terminate the contract without penalty. When determining a contract's duration, entities need to carefully evaluate the contractual terms (including any substantive termination provisions) and the present enforceable rights and obligations of both parties. Certain economic factors (e.g., economic compulsion) are not relevant because they do not create or modify present enforceable rights and obligations of either party.

Frequently asked questions

Question 4-6: How do termination clauses and termination payments affect the duration of a contract (i.e., the contractual period)?¹¹⁹

Entities need to carefully evaluate termination clauses and any related termination payments to determine how they affect contract duration (i.e., the period in which there are enforceable rights and obligations).

Enforceable rights and obligations generally exist throughout the term in which each party has the unilateral enforceable right to terminate the contract by compensating the other party. For example, if a contract includes a substantive termination payment, the duration of the contract would equal the period through which a termination penalty would be due. This could be the stated contractual term or a shorter duration if the termination penalty does not extend to the end of the contract. However, the determination of whether a termination penalty is substantive, and what constitutes enforceable rights and obligations under a contract, requires judgement and consideration of the facts and circumstances. If an entity concludes that the duration of the contract is less than the stated term because of a termination clause, any termination penalty needs to be included in the transaction price. If the termination penalty is variable, the requirements for variable consideration, including the constraint (see 6.2.3 below), apply.

If a contract with a stated contractual term can be terminated by either party at any time for no consideration, the contract duration ends when control of the goods or services that have already been provided transfers to the customer (e.g., a month-to-month service contract), regardless of the contract's stated contractual term. In this case, entities also need to consider whether a contract includes a notification or cancellation period (e.g., the contract can be terminated with 90 days' notice) that would cause the contract duration to extend beyond the date when control of the goods or services that have already been provided were transferred to the customer. If such a period exists, the contract duration would be shorter than the stated contractual term, but would extend beyond the date when control of the goods or services that have already been provided were transferred to the customer.

Consider the following illustrations that show how termination provisions affect the duration of a contract:

Illustration 4-4: Determining the duration of the contract

Entity A enters into a four-year service contract with a customer. The customer is required to pay a non-refundable annual fee of £100,000, which is the stand-alone selling price for each year of service.

To determine the duration of the contract in each of the scenarios below, the entity considers these facts and whether the contract provides cancellation rights and termination penalties.

Scenario A

Assume no cancellation rights are provided to either party. In this case, the enforceable rights and obligations exist for the entire stated contractual term and the contract duration is four years.

Scenario B

Assume the contract provides the customer with a right to cancel the contract at the end of each year without cause, but with a termination penalty. The penalty decreases annually throughout the contract term at the end of each year. The following illustrates the payments under the contract:

	Year 1	Year 2	Year 3	Year 4
Annual fee (£)	100,000	100,000	100,000	100,000
Termination penalty (£)	225,000	150,000	75,000	-

¹¹⁹ Based on TRG Agenda paper no. 10, *Contract enforceability and termination clauses*, dated 31 October 2014.

If Entity A determines that the penalty is substantive in each period, enforceable rights and obligations exist for the stated contractual term of four years.

Scenario C

Assume the contract provides the customer with a right to cancel at the end of each year, with no termination penalty.
